Energy Research Abstracts

Abstracts 35511-37824

Office of Scientific & Technical Information
UNITED STATES DEPARTMENT OF ENERGY

The Office of Scientific and Technical Information

The Department of Energy's Scientific and Technical Information Program (STIP) is carried out at many levels within the Department and by its contractor organizations. The Office of Scientific and Technical Information (OSTI) in Oak Ridge, Tennessee, provides direction and leadership for STIP and serves as DOE's national center for scientific and technical information management and dissemination. Both DOE-originated information and worldwide literature regarding advances in subjects of interest to DOE researchers are collected, processed, and disseminated through the Energy Data Information System (EDIS) maintained by OSTI. The major data bases in this system are available within the United States through commercial on-line systems and to those outside the United States through formal governmental exchange agreements. The current-year records for the major data bases plus a number of specialized data bases are available to DOE offices and contractors through OSTI's Integrated Technical Information System (ITIS). To manage DOE's information resources effectively, DOE's Scientific and Technical Information Program is one of continual development and evaluation of new information products, systems, and technologies.

Energy Research Abstracts

Purpose

Energy Research Abstracts (ERA) provides abstracting and indexing coverage of all scientific and technical reports, journal articles, conference papers and proceedings, books, patents, theses, and monographs originated by the U.S. Department of Energy, its laboratories, energy centers and contractors. *ERA* also covers other energy information prepared *in report form* by federal and state government organizations, foreign governments, and domestic and foreign universities and research organizations. Foreign information is obtained through the International Energy Agency's 13-nation Energy Technology Data Exchange, the International Atomic Energy Agency's International Nuclear Information System, or nation-to-nation agreements. **Please note that *ERA* coverage of non-report literature is limited to that generated by Department of Energy activity.**

Scope

ERA is comprehensive in its subject scope, encompassing DOE's research, development, demonstration, and technological programs resulting from its broad charter for energy sources, supplies, safety, environmental impacts, and regulation.

The citations presented in *ERA* are available for on-line searching as records within the Energy Data Base. The current-year records are available on the Integrated Technical Information System (ITIS). The entire data base is available through commercial on-line vendors.

Availability

DOE and DOE contractors who have OSTI deposit accounts can obtain *ERA* (regular issues and annual indexes) from the Office of Scientific and Technical Information, P.O. Box 62, Oak Ridge, TN 37831, Attention: Information Services. For further information, call (615)576-8401, FTS 626-8401. *ERA* is also available at authorized GPO Depository Libraries. (List is provided on the inside back cover.)

ERA is available to the public on a subscription basis from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. The subscription rate for 24 semimonthly issues is $184.00 for domestic subscribers and $230.00 for foreign subscribers. A single issue costs $27.00, domestic, or $33.75, foreign. Cumulative indexes are available from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. The GPO Stock Number is 661-000-00000-7 and the price is $174.00 for the Volume 13 indexes.

Managing Editor, Audrey B. Smith
Technical Editor, M. Catherine Grissom

Information Sources

The citations presented in *Energy Research Abstracts* are a subset of the worldwide energy information provided to the Office of Scientific and Technical Information (OSTI) through exchange agreements with foreign sources and through exchanges or contracts with U.S. organizations.

The **Energy Technology Data Exchange (ETDE)** was established by the International Energy Agency to promote cooperation among members in conducting appropriate energy-related research and development programs through the development of a formal central information sharing system. In accomplishing the objectives of the ETDE, members select, abstract, and index relevant research information published in their countries in accordance with Exchange standards. OSTI serves as the central receiving and processing center for this information, which it then disseminates to national centers in the participating countries. The following countries are currently members of the ETDE:

Canada	Japan
Denmark	The Netherlands
Finland	Norway
France	Spain
Federal Republic of Germany	Sweden
Italy	United Kingdom
	United States

The **International Nuclear Information System (INIS)** was established to promote the exchange of information on nuclear science and technology. Its operation is similar to that of the ETDE, with the INIS Secretariat being located in Vienna, Austria. Currently, 75 countries and 14 international organizations are members of INIS. OSTI serves as the INIS national center for the United States.

In the exercise of its rights and responsibilities under the agreements to which it is a party, the **Office of Scientific and Technical Information** both receives information from the above sources and submits U.S.-produced information to them. In addition to materials generated by the Department of Energy, this U.S.-produced information is gathered from other government agencies as well as under contract with private information processing companies. All input is computer processed and entered into a data base for on-line retrieval. The data base serves as well for the production of numerous OSTI publications.

How To Read A Citation

The coverage of literature in this publication includes several document types, ranging from technical reports to journal articles to books. The principal data elements included in these citations are:

1. **Abstract number** within volume.
2. **Report number** identification for report-type literature.
3. **Title and subtitle** (non-English title may appear in parentheses, if applicable).
4. **Author(s).** First 10 names in the data record are printed, then "et al." is listed.
5. **Author affiliation.** Only first one is listed, in parentheses after author(s) to which it applies.
6. **Collaboration,** if present.
7. **Corporate author(s)** identifying corporation responsible for document.
8. **Patent assignee and number** for citations of patent documents or applications.
9. **Journal title, volume, and issue** for citations of journal articles.
10. **Date of publication.** If not known, a processing date is in brackets.
11. **Number of pages** or page range.
12. **Language** of document if non-English.
13. **Monograph title** if citation is an analytic (part, chapter, or paper) of a larger monograph.
14. **Publisher's name and location** for documents published by a corporate or commercial source.
15. **Sponsoring organization.**
16. **Contract or grant number.**
17. **Secondary identifying number;** may be a conference number.
18. **Conference title, location, and date,** if applicable.
19. **Order number.** The "DE" order number may be used for ordering from NTIS or OSTI, as appropriate. The "TI" prefix is valid only at OSTI.
20. **Sources of availability** from which a copy of the document may be obtained; usually appear as abbreviations. (See information on following page.)
21. **Drop note** or explanatory statement.
22. **Abstract.**
23. **Subject descriptors.** Listed only if no abstract or only a brief statement is included.

How To Order from the Availability Sources

TO OBTAIN A REPORT

Report literature, usually identified by an alphanumeric identifier at the beginning of a citation, is available from the sources listed in the citation (see example of element 20 on page iii). Often the sources are listed as abbreviations. Corresponding addresses are provided at right from which documents with these abbreviations may be ordered. When "OSTI" is given, **DOE and DOE contractors may order these documents from OSTI.** (However, check with your library or information organization which may require that orders go through them to OSTI.) The public should order from NTIS or from one of the other agencies listed in the citation. To expedite processing, an order form is provided in the back of this publication. NOTE: The order numbers provide quicker access for report ordering. Use the order number where possible.

TO OBTAIN NON-REPORT LITERATURE

Nonreport literature generally is available from the commercial publisher or corporation listed in the citation. These documents may also be available for loan from local libraries. First, check with the local library. Other sources of information are:

Journal articles *Chemical Abstracts Service Source Index (CASSI)* tells which libraries, both U.S. and foreign, contain a journal and the available years. *Ulrich's International Periodicals Directory* contains information on the journal and its publisher. For librarians, another source of information is On-Line Computer Library Center (OCLC), for interlibrary loans.

Books, conferences, and monographs The source for these publications is the publisher or the originating society, organization, or institution. DOE-supported conferences and individual papers reporting DOE-supported research may be available as reports from OSTI.

Foreign material The Linda Hall Library is an excellent source of foreign materials. For translations of foreign language material, contact the John Crerar Library. For material difficult to locate, check with the British Library Document Supply Centre.

How To Use the Indexes

Five indexes are provided for approaching the content of each issue of *Energy Research Abstracts*. Descriptions of entries in these indexes follow.

Corporate Author Index
The corporation, organization, or institution responsible for the issuance of the document is listed in this index. The entries are arranged alphabetically and provide the title and citation number of the reference. For example, the listing for the "Report" sample citation would appear as shown at right.

Wisconsin Univ., Madison (USA). Dept. of Physics
[Development of a hydrogen and deuterium polarized gas target for application in storage rings]: Progress report, 14:18494 (R;US)
Wisconsin Univ., Madison (USA). Lab. of Genetics
Organization of the R chromosome region in maize: Final progress report, June 1, 1983–May 31, 1986, 14:18255 (R;US)

Personal Author Index
Each author's name listed on a document cited in this issue is indexed. An index entry provides title and citation number; for secondary and other names, a cross-reference is given to the primary author name where the full index entry is located.

Hadley, D.L., *See* Lee, A.D., 14:17651
Haeberli, W., [Development of a hydrogen and deuterium polarized gas target for application in storage rings]: Progress report, 14:18494 (R;US)

Subject Index
This index lists the main subject descriptors assigned to each record by indexing professionals. A secondary or qualifier term is used where necessary to describe materials, objects, and processes. Document titles may be enhanced with additional informative phrases where necessary. An excerpt from this index appears at right.

HYDROGEN ISOTOPES
See also DEUTERIUM
HYDROGEN 4
TRITIUM
Neutron-Rich Isotopes
Study on the strong neutron-rich nuclei of lightest elements, 14:18686 (RA;SU;In Russian)

Contract Number Index
DOE technical reports are listed by contract number. Each entry also provides the primary corporation or organization cited for that contract number. A typical entry is shown.

FG02-88ER40438 **Wisconsin Univ., Madison (USA). Dept. of Physics**
14:18494 DOE/ER/40438–T1
FG02-88ER60664 **Rogers and Associates Engineering Corp., Salt Lake City, UT (USA)**
14:17641 DOE/ER/60664–1

Report Number Index
Technical report literature is indexed by the alphanumerical identifier of the report. Patent documents and conferences are included for convenience. Each entry lists the citation number, the source of availability of the document, an indicator of presence at a GPO depository library, order number, and distribution category. A typical entry is:

DOE/ER/40438–T1 14:18494 NTIS, PC A03/MF A01 - OSTI E 1.99: DE89007246/JAW MF-411

Subject Contents

The subject content of *Energy Research Abstracts* is arranged as shown below. The two-digit and four-digit category numbers printed here illustrate the category number assignment used in the data base records.* The following list includes all of the 40 first-level and the 289 second-level categories. Because each issue of *ERA* publishes citations only for those documents announced during the past semimonthly period, some subject categories may not be present in every issue.

35511 (DOE/PC/88875–T1) **[Advanced froth flotation techniques]: Quarterly technical progress report No. 1, September 1, 1988–November 30, 1988.** Kaiser Engineers, Inc., Pittsburgh, PA (USA). 1988. 4p. Sponsored by DOE Fossil Energy. DOE Contract FG22-88PC88875. Order Number DE89014662/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The testing of advanced froth flotation techniques of coal from Ohio coal seams was started. Initial results on sulfur reduction of Meigs Creek coal are presented. (CBS)

35512 (DOE/PC/88875–T2) **Testing of pyrite flotation techniques on selected Ohio coals: Final report.** Arnold, B.J.; Torak, E.R. Kaiser Engineers, Inc., Pittsburgh, PA (USA). May 1989. 364p. Sponsored by DOE Fossil Energy. DOE Contract FG22-88PC88875. Order Number DE89014664/JAW. Available from NTIS, PC A16/MF A01 - OSTI.

The project was conceived to demonstrate the combining of conventional physical coal cleaning with emerging advanced physical coal cleaning technologies in a cost-effective manner. The objectives of the program were to demonstrate that conventional coal cleaning followed by advanced coal cleaning of a crushed mid-gravity portion of the run-of-mine coal would produce a clean coal, suitable for use as a thermal coal, having a lower ash content and a lower sulfur dioxide emission potential than a coal cleaned only be current conventional cleaning technologies. As part of this program a number of advanced flotation techniques were tested to determine the feasibility of including them in the design of their Advanced Coal Preparation Facility. The program consisted of testing the Pittsburgh seam, the Middle Kittanning seam, and the Meigs Creek seam coals in the pilot flotation circuit at EPRI's Coal Quality Development Center (CQDC) in Homer City, Pennsylvania. This report contains all the data from OCDO's pilot flotation test program at the CQDC and the test data from the Middle Kittanning and Meigs Creek reverse flotation tests. 13 figs., 40 tabs.

35513 (DOE/PC/88886–T2) **Development of an advanced process for drying fine coal in an inclined fluidized bed: Technical progress report for the second quarter, January 19–March 31, 1989.** Boysen, J.E.; Cha, C.Y.; Berggren, M.H.; Jha, M.C. Western Research Inst., Laramie, WY (USA); AMAX Research and Development Center, Golden, CO (USA). May 1989. 34p. Sponsored by DOE Fossil Energy. DOE Contract AC22-88PC88886. Order Number DE89013514/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This research project is for the development of a technically and economically feasible process for drying and stabilizing of fine particles of high-moisture subbituminous coal. Research activities were initiated with efforts concentrating on characterization of the two feed coals: Eagle Butte coal from AMAX Coal Company's mine located in the Powder River Basin of Wyoming; and coal from Usibelli Coal Mine, Inc.'s mine located in central Alaska. Both of the feed coals are high-moisture subbituminous coals with "as received" moisture contents of 29% and 22% for the Eagle Butte and Usibelli coals, respectively. However, physical analyses of the crushed coal samples (–28-mesh particle size range) indicate many differences. The minimum fluidization velocity (MFV) of the feed coals were experimentally determined. The MFV for –28-mesh Eagle Butte coal is approximately 1 ft/min, and the MFV for –28-mesh Usibelli coal is approximately 3 ft/min. 2 refs., 16 figs., 3 tabs.

35514 (DOE/PC/91271–T22) **Coal disintegration by high-pressure waterjet: Final report.** Mazurkiewicz, M. Missouri Univ., Rolla, MO (USA). Rock Mechanics and Explosives Research Center. Dec 1988. 144p. Sponsored by DOE Fossil Energy. DOE Contract AC22-86PC91271. Order Number DE89009795/JAW. Available from NTIS, PC A08/MF A01 - OSTI; GPO Dep.

A data base was constructed to demonstrate the capability and mechanism of coal comminution by means of high-pressure waterjets. With the aid of the data base, two laboratory-scale grinding mills were designed, constructed, tested, and evaluated for the production of sub-75-micron coal particles. One of the mills, a rotating-disk mill with one fixed waterjet, showed promise for significant efficiency. 11 refs., 85 figs., 27 tabs.

35515 (PB–89-162366/XAB) **Oil phase in selective agglomeration: a structural approach.** Labuschagne, B.C.J. National Inst. for Coal Research, Pretoria (South Africa). 1986. 37p. Available from NTIS, PC EE05/MF E05.

North American Continent sales only.

The 'structural approach' provides a method for determining the semi-quantitative contribution of physical and chemical properties on specific agglomeration aspects for coals within a certain hydrophobic range, which could be compared with results obtained for coals with different surface properties. Thus, by using properly selected bridging liquids such as individual members of an homologous series, different classes of compounds, and binary mixtures of known composition, the contribution of specific oil parameters (physical constants, chemical properties, structural aspects) on specific aspects of the spherical agglomeration process for fine coal (e.g., agglomeration time, agglomerate strength, final agglomerate size, percentage deashing, and organic recovery) can be determined or evaluated.

35516 (SP–87-11E) **Canadian coal preparation process-control research and development directions.** Salama, Ahmed, I.A. Canada Centre for Mineral and Energy Technology, Ottawa, ON (Canada). 1988. 69p. Available from Canadian Government Publishing Centre, Ottawa, ON, K1A 0S9 CANMET, 55 Booth St., Ottawa, Ontario, Canada K1A 0G1.

In response to the reduced world demand for coal, the coal industry has been challenged to optimize its operations and reduce the cost of production. In this paper the author, under the auspices of CANMET, conducted an industry survey and field visits to determine coal industry interest in process control development and priorities regarding specific plant circuits. This document evaluates the results of the survey, focuses on the on-line process control and instrumentation applications, and identifies future directions for research and development. 49 refs., 12 tabs., 7 figs.

This study reports the effect of process parameters such as temperature, pressure and time, on the extent of the coal conversion and on product distribution. The data indicate that it is possible to solubilize part of the coal by using Athabasca bitumen and related liquids as solvents, and the extent of solubilization varies depending upon the type of solvent used. Control experiments were performed in order to determine the degree of coke (toluene insoluble) formation during the thermal treatment of the solvents. Coke formation was anticipated since oil sands bitumen and heavy oil are susceptible to heat. Composition of gases from the thermal treatment of solvents shows that the gas products mainly consist of hydrocarbons and hydrogen sulfide. Compositional differences of the solvent as a result of heat treatment also occur and there are variations in the distribution of products–coke (toluene insolubles), liquids (toluene solubles), and gases. 6 refs., 1 fig., 10 tabs.

35519 (CONF-890582–1) **Characterization and subsequent utilization of microbially solubilized coal: Preliminary studies.** Davison, B.H.; Nicklaus, D.M.; Woodward, C.A.; Lewis, S.N.; Faison, B.D. Oak Ridge National Lab., TN (USA). 1989. 38p. Sponsored by DOE/FE;EPRI. DOE Contract AC05-84OR21400. From Biological processing of coal and coal-derived substances; Palo Alto, CA, USA; 16-17 May 1989. Order Number DE89011577/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The solubilization of low-ranked coals by fungi, such as Paecilomyces and Candida, in defined submerged culture systems has been demonstrated. Current efforts focus on the characterization of the aqueous solubilized coal products and the development of technologies for their subsequent utilization. Solubilized coal products have been fractionated, and preliminary characterizations performed. Differences in product composition have been detected with respect to the organism used in culture duration. Prospects for the conversion of the aerobically-solubilized coal into less-oxidized products have been developed which can remain active and viable in the presence of the aqueous coal product or vanillin, a coal model compound. The results suggest that a methanogenic consortium was able to produce methane and carbon dioxide from the product of coal biosolubilization by Paecilomyces as a sole carbon source. Work continues on the development of cultures able to convert the aqueous coal product and its various fractions into methane or fuel alcohols. 17 refs., 8 figs.

35520 (CONF-8511136–7) **Microbial coal liquefaction.** Scott, C.D.; Strandberg, G.W. Oak Ridge National Lab., TN (USA). 1985. 23p. Sponsored by DOE Fossil Energy. DOE Contract AC05-84OR21400. From Direct liquefaction contractors conference; Pittsburgh, Pennsylvania, USA; 19-21 Nov 1985. Order Number DE89014193/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The production of apparent coal-derived, water-soluble products occurs when certain microorganisms are cultured in the presence of low-ranked coal. The potential utility of these organisms to convert coal to useful liquid products is being investigated. Particular emphasis is being placed on determining the operating parameters that affect liquefaction, on establishing the characteristics of the liquid products, and on studying potential process approaches that could be used for large-scale operation. Various fungi appear to be the most active organisms and several species have been found associated with lignite in the natural state. Lower-ranked coals seem to be better substrates, although biological action on one subbituminous coal was observed. Liquefaction rate appears to be related to the oxidation state of the coal, as well as other chemical characteristics. The liquid product is not well defined, but it includes a large number of soluble molecular constituents, some of which may have moderate to high molecular weights. Most work has been carried out with surface cultures; however, several different types of organisms can be induced to attach to the solid surface of coal when in suspension culture. The latter may represent the mode of operation for a large processing system. 9 refs., 7 figs., 5 tabs.

35521 (CONF-8806136–1) **The chemical origin of synergy in liquefaction and co-processing.** McMillen, D.F.; Malhotra, R.; Tse, D.S.; Nigenda, S.E. SRI International, Menlo Park, CA (USA). Chemical Physics Lab. 1988. 8p. Sponsored by DOE Fossil Energy. DOE Contract FG22-86PC90908. From American Chemical Society Division of Fuel Chemistry meeting; Toronto, Canada; 5-10 Jun 1988. Order Number DE89012984/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The question of possible synergistic effects for coal liquefaction has been raised recently in the context of coprocessing and also in that of straight donor-solvent liquefaction. Synergy is generally defined to occur when the effect of a combination of components exceeds the sum of the effects of the individual components. The existence of such synergism is more difficult to demonstrate in the coprocessing context, because liquefaction of coal alone, that is, in the absence of any other component (e.g., residual oil), is not viable in process terms, and therefore one of the boundary conditions is not available. Synergism can be much more readily assessed in the context of straight liquefaction, where there is always a liquefaction medium, which can be made up of a number of components. This paper specifically addresses liquefaction data, but the conclusions drawn are all equally applicable to coprocessing. 10 refs., 3 figs.

35522 (DOE/FE–0132) **Underground coal gasification program plan, FY 1989.** USDOE Assistant Secretary for Fossil Energy, Washington, DC (USA). Office of the Deputy Assistant Secretary for Oil, Gas, Shale and Special Technologies. Jun 1989. 25p. Sponsored by DOE Fossil Energy. Order Number DE89013913/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A brief program plan for in-situ coal gasification is described. The following areas are discussed: Background and program goal; Technology description; Technology status and research needs; Program strategy; Program management; and International activities. 5 refs., 3 figs., 1 tab.

35523 (DOE/FE/60457–H4) **A fundamental research program in coal/heavy oil coprocessing and heavy oil processing: Final report.** Schulman, B.L. SFA Pacific, Inc., Mountain View, CA (USA). Jun 1989. 87p. Sponsored by DOE Fossil Energy. DOE Contract AC01-84FE60457. Order Number DE89013882/JAW. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

The coprocessing of coal with petroleum residues provides an effective route for increasing the use of domestic resources—coal and natural gas—to produce liquid fuels. In addition, the initial step of converting petroleum residues alone by hydrocracking can significantly improve the yield of light fuels from crude oil. Several technologies have been developed and commercialized for hydrocracking residues and the liquefaction of coal. All of these technologies can be improved further, based on concepts that can come from a fundamental research program, and using the ideas developed in engineering studies. This work discusses a suggested 5-year research program to carry out fundamental work and explore ideas. The fundamental research program covers work to discover routes to improve yields and product quality when processing coal and petroleum residues together or separately. The program provides both an effective supplement and complementary bridge to the existing programs on coal processing and heavy oil characterization. The work includes the technical rationale and level of effort recommended to implement the studies in the key areas of: new catalysts, detailed feed and product characterization, new processing concepts, and product quality. 4 figs.

35524 (DOE/MC/23077–2696) **Engineering support services for the DOE/GRI coal gasification research program: Technical progress report for the period June 25–September 30, 1988.** Foster Wheeler USA Corp., Clinton, NJ (USA). 1988. 28p. Sponsored by DOE Fossil Energy. DOE Contract AC21-86MC23077. Order Number DE89012443/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The objective of this contract is to provide technical support for the Department of Energy (DOE)/Gas Research Institute (GRI) Joint Operating Committee, which oversees and administers the DOE/GRI Joint Coal Gasification Research Program. The general scope of these support services consists of technical assistance in the following areas: evaluation of modular coal gasification combined cycle power systems; plant operating requirements; to report on results presented at a debriefing on hot gas cleanup; economic analysis; and an analysis of IGT's high pressure gasification data. 4 refs., 3 figs., 8 tabs.

35525 (DOE/PC/79808–T2) **Deactivation of hydrotreatment catalysts used for coal liquids: Semi-annual report, 12 May 1988–11 November 1988.** Dadyburjor, D.B. West Virginia Univ., Morgantown, WV (USA). Dept. of Chemical Engineering. 1988. 5p. Sponsored by DOE Fossil Energy. DOE Contract FC22-88PC79808. Order Number DE89014725/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Coal liquid hydrotreatment catalysts deactivate rapidly due to deposition of coke and metals inside the pores of the catalyst particles. The deactivation can be due to the gradual choking of the catalyst pores and/or due to the suppression of active sites on the catalyst. The objective of the proposed work is to determine which of these two mechanisms of deactivation is predominant, and this done by using the Constant Deactivation Arrhenius Plot (CDAP) technique. The Catalysts Co-Mo/Al_2O_3 and Ni-Mo/Al_2O_3 which have previously been deactivated to different extents in run number 242 at Wilsonville's coal liquefaction facility, are used in this study. The hydrodesulfurization of thiophene, which does not deactivate the catalyst, is used to characterize the relative activities of these catalysts. Arrhenius plots for these catalysts are being obtained. From the Arrhenius plots, the CDAP technique determines the intrinsic reaction rate constants and the effective diffusivities for each of these catalysts. 1 fig., 2 tabs.

35526 (DOE/PC/88801–T2) **Improved performance in coprocessing through fundamental and mechanistic studies in hydrogen transfer and catalysis: Quarterly report, December 27, 1988–March 27, 1989.** Curtis, C.W.; Guin, J.A.; Tarrer, A.R. Auburn Univ., AL (USA). Dept. of Chemical Engineering. 1989. 26p. Sponsored by DOE Fossil Energy. DOE Contract AC22-88PC88801. Order Number DE89013676/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

To gain fundamental understanding of the role and importance of hydrogen transfer reactions in thermal and catalytic coprocessing by examining possible donation from cycloalkane/aromatic systems and by understanding the chemistry and enhanced reactivity of hydrotreated residuum, by enriching petroleum solvent with potent new donors, nonaromatic hydroaromatics, thereby promoting hydrogen transfer reactions in coprocessing. This quarter, a complete literature search was performed on hydrogen donation in coprocessing and coal liquefaction. The objective of this search was to undercover the role of hydrogen transfer from different types of model molecules to one another as well as the role of hydrogen donation in coprocessing and coal liquefaction. 24 refs.

35527 (DOE/PC/88802–T1) **Exploratory coprocessing research: Quarterly report number 2, for the period December 1, 1988 to February 28, 1989.** Hirschon, A.S.; Tse, D.S.; Malhotra, R.; McMillen, D.F.; Ross, D.S. SRI International, Menlo Park, CA (USA). Apr 1989. 13p. Sponsored by DOE Fossil Energy. DOE Contract AC22-88PC88802. Order Number DE89014659/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The objectives of this project are to: (1) study the scope of hydrothermal pretreatment of coal on subsequent conversion, (2) identify and study the chemical or physical causes of this effect, and (3) attempt to elucidate the chemistry responsible for any coal-resid synergisms. This project is divided into three tasks. Task 1 and 2 were addressed this quarter: (1) Scope of Aqueous Pretreatment. We conducted preliminary experiments this quarter in order to determine the correct operating conditions from which to base our subsequent experiments. In these experiments, we treated an Illinois number 6 coal with Maya ATB with 500 psi of hydrogen at 400°C. Chemistry of Pretreatment. Last quarter, we compared the pyrolysis of pretreated and non-pretreated Illinois number 6 coal by use of field ionization mass spectroscopy (FIMS), and found from a difference spectrum of the two samples that the pretreated coal produced more volatiles at lower temperatures than the non-pretreated coal. However, the pretreated coal also contains a smaller particle size distribution than the non-pretreated coal. This quarter we ran a similar experiment comparing the FIMS of the coal with two different particle size distributions. We also investigated the pyrolysis chemistry of phenolics, which we believe to be a potential source of regressive reactions.

35528 (DOE/PC/88920–T1) **Electrochemistry of thiobacillus ferrooxidans reactions with pyrite: Technical progress report, January 15–April 15, 1989.** Pesic, B. Idaho Univ., Moscow, ID (USA). Dept. of Metallurgical and Mining Engineering. 1989. 30p. Sponsored by DOE Fossil Energy. DOE Contract FG22-88PC88920. Order Number DE89013103/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The objective of this project is to provide the fundamental information on the mechanisms of bacterial leaching of pyrite. The knowledge of how bacterial leaching of pyrite works is essential for design and development of a technology for coal cleaning with bacteria. The features of major electrochemical techniques will be examined to find out if any of them can provide diagnostic information on the mechanisms of related reactions. This project will have several major research directions. One of them is the electrochemistry of interactions of Thiobacillus ferrooxidans with mineral pyrite, the second is the electrochemistry of bacteria interactions with coal pyrite. The third major direction is the role of Thiobacillus ferrooxidans cell components (amino acids and vitamins) during oxidation of ferrous iron with oxygen. The research results from these three directions will be used to elucidate the reactions involved during interaction of Thiobacillus ferrooxidans with pyrite. Results of cyclic voltametry are presented. 17 figs.

35529 (DOE/PC/88922–T1) **Supercritical fluid thermodynamics for coal processing: Quarterly progress report, September 15, 1988–December 31, 1988.** Eckert, C.A. Illinois Univ., Urbana, IL (USA). Dept. of Chemical Engineering. 1988. 8p. Sponsored by DOE Fossil Energy. DOE Contract FG22-88PC88922. Order Number DE89014214/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Because of their unusual solvating and mass transfer properties, supercritical fluids show potential for a variety of coal processing applications. To establish a database of coal model compound equilibria, this quarter we have measured the solubility of 5,6-dimethyl-benzimidazole and anthraquinone in supercritical butane. In addition, we have used fluorescence spectroscopy to study the nature of the intermolecular interactions in the systems of pyrene and naphthalene in supercritical CO_2, C_2H_4, and CF_3H. The spectroscopy measurements are being used to guide the development of an equation of state that can be used to predict the solubility behavior so systems can be designed for the processing of coal with supercritical fluids. 4 figs.

35530 (DOE/PC/90523–T4) **Phase equilibrium data for development of correlations for coal fluids: Report for the period April 15, 1989–June 15, 1989.** Robinson, R.L. Jr. Oklahoma State Univ., Stillwater, OK (USA). School of Chemical Engineering. 15 Jun 1989. 17p. Sponsored by DOE Fossil Energy. DOE Contract FG22-86PC90523. Order Number DE89014505/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The effective design and operation of processes for conversion of coal to fluid fuels requires accurate knowledge of the phase behavior of the fluid mixtures encountered in the conversion processes. The overall objective of this work is to develop accurate predictive methods for representation of vapor-liquid equilibria in systems encountered in coal-conversion processes. During the present report period, data have been obtained on the solubility of methane in n-octacosane (n-C_{28}) at 348.1 K, 373.1 K, and 423.1 K, and in n-hexatriacontane (n-C_{36}) at 373.1 K and 423.1 K. These data are well described by the Soave and Peng-Robinson equations of state and the Krichevsky-Kasarnovsky correlation. The present data for methane and n-octacosane are in reasonable agreement with those reported by Stanley and co-workers. For methane + n-hexatriacontane at 373.1 K, larger disagreements are observed between the present data and those reported by Tsai and co-workers. 16 refs., 4 figs., 5 tabs.

35531 (DOE/PC/90908–T6) **Factors controlling hydrogenolysis in coal liquefaction: Quarterly report No. 6 for the period October 1–December 31, 1987.** McMillen, D.F.; Malhotra, R.; Tse, D.S.; Nigenda, S.E. SRI International, Menlo Park, CA (USA). Feb 1988. 10p. Sponsored by DOE Fossil Energy. DOE Contract FG22-86PC90908. Order Number DE89013505/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The objective of this study is to determine in greater detail the factors affecting radical hydrogen-transfer and other H-transfer modes shown in a previous DOE-sponsored study to be important

in solvent-mediated hydrogenolyses of model compounds and inferred to be important in coal liquefaction. We are investigating the cleavage rates of suitable model compounds in a variety of solvent systems with and without added coals, thereby assessing the relative importance of hydrogenolysis via free H-atoms and via radical hydrogen transfer (RHT). We have been able to differentiate between hydrogenolysis via the two processes by examining the selectivity of cleavage of 1,2'-dinaphthylmethane. To further aid our understanding to the competition in cleavage of strong bonds by various modes of H-transfer, we are conducting some mechanistic modeling studies. With these studies we can deconvolute the effects of solvent thermochemistry, concentration, hydrogen pressure, and temperature on various mechanisms for solvent-mediated bond cleavages, and thereby gain a better fundamental understanding of the competing processes. Finally, we are also trying to understand the impact of mass transport limitations that are likely to be important in actual coal liquefaction because of the heterogeneous nature of coal. 7 refs., 2 tabs.

35532 (EPRI-ER–6366) **The selective oxidation desulfurization process: bench-scale studies: Final report.** Tewksbury, T.L.; Carlton, H.E.; Cho Kim, B.; Fan, L.-S.; Oxley, J.H. Electric Power Research Inst., Palo Alto, CA (USA); Battelle Columbus Div., OH (USA). c May 1989. 58p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Five high-sulfur caking coals were desulfurized, under bench-scale conditions, using a fluidized-bed selective oxidation process. Earlier work with this selective oxidation process (EPRI report AP-4873) had shown very promising sulfur removal results under batch operating conditions. For this current work, the bench-scale unit was modified is that it could simulate continuous operation under more realistic conditions: the collection and recycle of fines, addition of SO_2 to the fluidizing gas, and semi-continuous feed. Under batch conditions, the reductions in sulfur achieved were generally equivalent to at least the pyritic sulfur content of each coal. The simulated continuous-operation experiments indicated that continuous operation might give slightly reduced sulfur-removal efficiencies. Temperatures of 725-775°F and residence times of 2-4 hours are required for near optimum sulfur removal. Gas compositions of 8-26% air (92 to 74% steam) were used. For Pittsburgh No. 8 seam coal, 70% reduction in total sulfur was achieved. Kentucky No. 9 seam coal had a sulfur reduction of over 60% and the two Illinois No. 6 coals were desulfurized by over 50%. Heating value losses from the coals during processing ranged from 5 to 40 percent. 11 figs., 7 tabs.

35533 (ERP/ERL–88-20(TR)) **Bibliography of CANMET publications on coprocessing.** Canada Centre for Mineral and Energy Technology, Ottawa, ON (Canada). Mar 1988. 48p. Available from CANMET, 555 Booth St., Ottawa, Canada, K1A 0G1.

The term coprocessing refers to the processing of mixtures of coal and oil with the objective of liquefying the coal and upgrading the oil simultaneously. This bibliography provides a source of all publications produced by CANMET to date on coprocessing technology.

35534 (ETDE-mf–9788054) **Behaviour of secondary and trace elements during coal gasification in an iron bath.** Oehler, W. Technische Hochschule Aachen (Germany, F.R.). Fakultaet fuer Bergbau und Huettenwesen. 13 Mar 1987. 98p. (In German). Order Number DE89788054/JAW. Available from NTIS (US Sales Only), PC A05/MF A01.

Within the framework of this study, the distribution of some elements, particularly trace elements contained in coals, was examined, with respect to coal gasification in liquid iron baths. A selection of bibliographical data on the chemical analysis of accompanying and trace elements in coals and thermodynamic calculations of the distribution of the elements and their combination forms in gaseous phases, melts, and slags are compared with the results of practical gasification tests (distribution of the elements V, Mn, Cr, Cu, Zn and Si), carbon content being consitent, as well as with the bottom-blowing and blow-through methods of coal gasification in iron baths.

35535 (EUR–11729-DE) **Determining the density distribution in a 7 metre coke oven.** Eisenhut, W.; Huhn, F.; Strelow, F. Commission of the European Communities, Luxembourg (Luxembourg). 1988. 23p. (In German).

The report is in two parts. This part describes a process which has been developed for determining the density distribution in a 7-metre coke oven. The measurements are taken with a modified radiometric density-moisture probe which uses the backscatter method as the measuring principle. A Cs 137 gamma emitter (10 mCi) and an Am 24 1/Be neutron emitter (100 mCi) act as radiation sources. The exact positioning of the probe in the oven charge is undertaken through special filling-hole lids, constructed to a high degree of precision using laser measurement, which are bolted on to the filling-hole frames. In order to comply with radiation protection instructions, the emitter capsules are manufactured from heat-resistant steel to allow for those cases in which the probe must remain in the oven until the end of the carbonisation period. This prevents the release of radioactive material. As a further means of protection, detector devices are arranged above the coke belts in the coke ramp area; these devices serve to shut-down the belt drives should high levels of radiation activity be detected. The first measurements indicated a large variation in the density of the charge in respect of its height. In addition, the density of the charge in the area beneath the filling holes was considerably greater than the average bulk density for the oven as a whole. This is partly dependent on the concentration of water in the centre of the charge. The main findings of the measurement programme will be published at a later date. The second part of this report contains two appendices and has been abstracted separately.

35536 (ORNL/FTR–3282) **[2nd international symposium on high-temperature corrosion of advanced materials and coatings, Les Embiez, France, and visit to Manchester, England, May 19–27, 1989]: Foreign trip report.** Wright, I.G. Oak Ridge National Lab., TN (USA). 12 Jun 1989. 11p. Sponsored by DOE Fossil Energy. DOE Contract AC05-84OR21400. Order Number DE89014746/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The primary purpose of this trip was to participate in the 2nd International Symposium on High-Temperature Corrosion of Advanced Materials and Coatings in France. Results from work were presented in a paper entitled "Effects of Minor Alloying Additions on the Development of Protective Oxides Scales at 700°C," while other activities were to chair the conference session on Databanks and Expert Systems, and to participate in review of manuscripts and arrangement for the publication of the conference proceedings. Discussions at the conference that were useful to our ongoing ORNL research program concerned the effects of rare-earth additions on the development of protective oxide scales, and the role of stress generated either from the growth of oxide scales or from differential thermal expansion between oxide scales and alloy substrates on the protective nature of scales, and on techniques to measure some of these effects in situ. A visit was also made to the UMIST in Manchester, England, to discuss the results of work of a similar nature to that in progress at Battelle. In general, UMIST results are quite similar to those found at Battelle and provide some insights into the detailed modes of breakdown of chromia and alumina scales. Simple experimental techniques that were developed to try to pinpoint key features of scale breakdown proved to be quite insightful, and will be applied to some of the specimens generated in the Battelle studies.

35537 (ORNL/FTR–3283) **[2nd International symposium on high-temperature corrosion of advanced materials and coatings, Les Embiez, France, May 22–26, 1989]: Foreign trip report.** Srinivasan, V. Oak Ridge National Lab., TN (USA). 12 Jun 1989. 23p. Sponsored by DOE Fossil Energy. DOE Contract AC05-84OR21400. Order Number DE89014747/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The traveler participated in the 2nd International Symposium on High-Temperature Corrosion of Advanced Materials and Coatings and presented an invited paper. He chaired a session on High-Temperature Corrosion. The symposium covered 11 themes over 4-1/2 days. There were two sessions each day, one in the morning and one in the evening, with afternoons devoted to poster sessions. This provided opportunities for the participants to have private discussions on topics of mutual interest. About 180 participants from

the European Economic Community countries, Brazil, Canada, Japan, Republic of China, USA, and USSR attended the symposium. The presentations included papers on high-temperature corrosion and oxidation (44), coatings (35), ion-beam and laser-modified surfaces (20), hot corrosion (14), scale adherence and stresses in the scales (7) diffusion (3), erosion/corrosion (3), synergism between corrosion and mechanical properties (10), intermetallics (4), and industrial experience (5). Most of the presentations involved corrosion/oxidation of Fe-, Ni- and Co-base alloys and coatings with and without reactive element additions that are of interest to fossil energy programs of ORNL and DOE. The traveler had private discussions with other participants. 1 tab.

35538 (ORNL/Sub–83-43346/02) **Breakdown mechanisms of Al_2O_3, Cr_2O_3 and SiO_2 scales in $H_2/H_2O/H_2S$ environments: Final report, Volume 1.** Kim, G.M.; Meier, G.H. Oak Ridge National Lab., TN (USA); Pittsburgh Univ., PA (USA). Dept. of Materials Science and Engineering. 31 Jan 1989. 81p. Sponsored by DOE Fossil Energy. DOE Contract AC05-84OR21400. Order Number DE89014789/JAW. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

The breakdown mechanisms of preformed oxide scales, Cr_2O_3, Al_2O_3 and SiO_2, have been studied at low oxygen and high sulfur potentials in the temperature range 550 to 950°C. For Cr_2O_3 on Ni-30Cr, sulfur penetration occurs through thin areas in the Cr_2O_3 scale. The first sulfides to form on Fe-25Cr and Co-30Cr were observed at the scale/gas interface as the result of Fe or Co transport through the Cr_2O_3 scale. Alumina scales on Fe-18Cr-6Al-1Hf were broken down by crack formation. Addition of Hf to the alloy improved scale adherence and extended the time to breakdown. Additions of Ti to Fe-18Cr-6Al provided improved scale adherence without introducing continuous paths through the oxide scales. These scales were even more resistant than those on the Hf-containing alloys when exposed in high sulfur potential atmospheres. These results also extended to long term cyclic sulfidation/oxidation experiments and simulated syngas exposures. Pure alumina scales were never formed on Ni-18Cr-6Al and Co-18Cr-6Al alloys and the NiCrAl alloy underwent catastrophic corrosion in most sulfidation/oxidation exposures. For SiO_2 on Ni-20Si, although porosity can form at the scale/gas interface due to the high vapor pressures of SiS and SiO, the formation of a thin layer of vitreous silica and good scale adherence provide better resistance to sulfur penetration than do Cr_2O_3 and Al_2O_3. The SiO_2 scales formed on Fe-20Si and Co-20Si were not as protective as those formed on Ni-20Si. 33 refs., 42 figs.

35539 (ORNL/TM–11176) **Sulfidation/oxidation properties of iron-based alloys containing niobium and aluminum.** DeVan, J.H.; Hsu, H.S.; Howell, M. Oak Ridge National Lab., TN (USA). May 1989. 34p. Sponsored by DOE Fossil Energy. DOE Contract AC05-84OR21400. Order Number DE89013766/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Compatibility with mixed gases containing S, O, and Cl is a critical requirement for high-temperature alloys used in coal conversion and combustion applications. Comparative corrosion tests of Fe-25Cr-20Ni, Fe-18Cr-6Al, and Fe-9Cr-9Nb-6Al (wt %) at 700 to 800°C in a simulated coal gasification environment led to the development of Fe-Nb-Al alloys and testing of both Fe-Nb-Al and Fe_3Al alloys. The niobium and aluminum content in the latter alloys ranged from 8 to 18 and 6 to 16 wt %, respectively. The niobium addition was intended as a selective refractory sulfide former. Testing was carried out at 700 to 800°C in H_2S-H_2-H_2O gas mixtures with relatively low oxygen activities ($\leq 10^{-22}$ atm) and high sulfur activities ($\geq 10^{-6}$ atm). Metallographic and chemical analyses of the corrosion product scales and the underlying alloy were performed to determine the role of the respective metallic elements on sulfidation/oxidation processes. 8 refs., 14 figs., 3 tabs.

35540 (PB–89-160915/XAB) **Cool Water Coal Gasification Program: Monitoring Review Committee meeting report, Washington, D.C., July 12, 1988.** Cool Water Coal Gasification Program, Daggett, CA (USA). 1988. 126p. Available from NTIS, PC A07/MF A01.

See also PB–89-160907.

The Energy Security Act of 1980 established a program to provide financial assistance to private industry in the construction and operation of commercial-scale synthetic-fuels plants. The Cool Water Coal Gasification Program is one of the four projects awarded financial assistance. The program agreed to comply with existing environmental monitoring in the areas of water, air, solid waste, worker health and safety, and socioeconomic impacts during the period 1984-1989. As the first commercial-scale integrated gasification combined-cycle plant for generating energy from coal, the plant is designed to process a variety of coals with no liquid discharge, produce non-hazardous solid wastes, and produce very few air emissions. Monitoring data are to provide an information base for evaluating plant operations and for establishing information on environmental uncertainties associated with replication of synthetic-fuels facilities. A Monitoring Review Committee (MRC) comprised of participants from DOE, EPA, and the California Energy Commission, meets with the Program annually to discuss monitoring activities and review environmental and health monitoring information to determine any significant trends or patterns on pollutants releases. Results of the annual MRC meeting held July 12, 1988 in Washington, DC are presented.

35541 (PB–89-165104/XAB) **Quick-response evaluation of energy-related occupational safety and health programs. Task Order 1: mortality study of 50 workers exposed to coal-liquefaction processes at a Union Carbide Plant, Institute, West Virginia.** Palmer, A. SRI International, Menlo Park, CA (USA). Center for Occupational and Environmental Safety and Health. Nov 1977. 11p. Available from NTIS, PC A03/MF A01.

A study was undertaken of 50 Union Carbide employees who had been exposed to high-boiling oils containing polycyclic hydrocarbons, coal tar, and pitch. The exposures occurred as a result of a coal-hydrogenation process initiated at the West Virginia facility in May of 1952. Workers were given annual physical examinations and, beginning in 1955, quarterly skin inspections. A review of the findings does not support the initial hypothesis that those workers exposed to heavy streams of toxic materials who developed cancerous skin lesions were at risk for developing systemic carcinoma. Indeed, there was a marked lack of cancer-related deaths or morbidity in the study group after a latency period of 18 to 20 years. One case of lung cancer was reported in a subject at 60 years of age, after a lifetime of smoking. One case of prostatic cancer was diagnosed at 77 years of age. A review of the five deaths listed indicated all were cardiac related including coronary disease, arteriosclerotic disease, cor pulmonale, and myocardial disease.

35542 (PB–89-166730/XAB) **Feasibility of industrial coal conversion at Cornell University. Final report.** Bland, R.R. Cornell Univ., Ithaca, NY (USA). Dec 1984. 287p. Available from NTIS, PC A13/MF A01.

Portions of this document are not fully legible.

The New York State Energy Research and Development Authority has completed a project identifying the opportunities for replacing oil and gas with coal at Cornell University in Ithaca. This report investigates using coal to produce steam for heat and the on-site cogeneration of electricity. At Cornell, electricity is purchased primarily from the local utility, chilled water is produced by electric-driven chillers and most of the heat comes from steam produced by coal, oil, or gas boilers in a central-heating plant. A study was made to integrate the utility systems and demonstrate the feasibility of further industrial coal conversion at Cornell. Although there are two existing coal boilers used on campus, there could be significant economic benefits from displacing gas and oil. Coal conversion technologies studied include: installation of a new boiler for the existing central-heating plant; reconversion back to coal of an oil-fired boiler; low-Btu gasification; and evaluating the possible construction of a new central heating plant.

35543 (PB–89-167209/XAB) **Assessment of the techno-economic potential of Fischer-Tropsch slurry reactors.** Van Vuuren, D.S. Council for Scientific and Industrial Research, Pretoria (South Africa). Jul 1987. 33p. (CSIR-CENG–655). Available from NTIS, PC EE05/MF E03.

Summary in Afrikaans. North American Continent sales only.

Fischer-Tropsch (F-T) slurry reactors have considerable techno-economic potential for the South African synthetic-fuels industry, particularly in combination with gasifiers producing a synthesis gas with a low hydrogen content. For this combination, a cost benefit of

19% compared with existing commercial F-T processes is estimated. Slurry reactors make it possible to use low-hydrogen synthesis gas to provide flexibility in the product spectrum and to achieve high conversion per pass with stoichiometric consumption of the feed-gas components. Consequently, there is little need for gas recirculation and the generation of a fuel-gas fraction can be avoided. Recommendations cover: conceptual design studies of gasifier-slurry reaction combinations; development of F-T slurry reactor technology on a pilot scale; generation of fluid dynamic design information on F-T slurry reactors; development of F-T catalysts for the slurry environment, and consideration of the requirements for upgrading the reactor products.

35544 (PB–89-178735/XAB) **Coal-test program in a pressurized, fluidized-bed ash-agglomerating process development unit. Volume 2. Data analysis. Final report, November 15, 1984-August 31, 1987.** Goyal, A.; Rehmat, A. Institute of Gas Technology, Chicago, IL (USA). Mar 1989. 264p. Available from NTIS, PC A12/MF A01.

See also PB–88-104658.

The objective of the project is to extend the ash-agglomerating fluidized-bed gasification data base of important American coals to pressures of 500 psig. A series of gasification tests in IGT's 8-inch process development unit (PDU) with lignite and subbituminous coal produced steady-state data at 100, 200, and 300 psig. After GRI reviewed an analysis of this data, the PDU system was upgraded to 500-psig operating capability. A matrix of gasification tests were then completed with lignite and subbituminous coal at 200, 300, and 450 psig, and material and energy balances were prepared for various set points. A statistical technique was applied to reconcile the steady-state data estimating maximum-likelihood true measurement values while closing all element and energy balances exactly. Science Ventures, Inc. of California developed such a data-reconciliation computer software package known as BALAID. It takes advantage of all available measurement information, as well as information embodied in the conservation laws and in the estimated quality of the measurements. This program has been applied to the steady-state data resulting in improved balances.

35545 Evaluation of an on-line gas chromatographic system. Gibbon, G.A. (U.S. Dept. of Energy, Pittsburgh, PA (US)); Hackett, J. v.v of 1988 Pittsburgh conference and exposition on analytical chemistry and applied spectroscopy (abstracts). Pittsburgh Conference, Pittsburgh, PA (1988). (CONF-880204–: 39. Pittsburgh conference and exposition on analytical chemistry and applied spectroscopy, New Orleans, LA, USA, 22-26 Feb 1988).

Technical Paper NO. 209.

At the Pittsburgh Energy Technology Center (PETC), a concerted effort is being made to systematically transpose laboratory analytical methodology, developed during Fischer-Tropsch (FT) catalyst studies, to on-line applications. This report describes the chromatographic hardware developed for the combined on-line analysis of both the gas and the light-oil (volatile at 200^{0}C) phase produced during FT catalyst evaluation studies. The product stream contains H_2, CO, CO_2, H_2O, hydrocarbons (paraffins and olefins) and alcohols. Laboratory analysis of the condensed light-oil phase, from recent catalyst studies, have confirmed the presence of hydrocarbons up to C_{20} and primary alcohols up to C_{15}. Therefore, the on-line analytical system must be able to provide quantitative data on the above species and also to detect them at their vapor phase concentrations.

35546 Coal/oil coprocessing mechanism studies. Cugini, A.V. (USDOE Pittsburgh Energy Technology Center, PA); Lett, R.G.; Wender, I. *Energy and Fuels (USA),* 3(2): 120-126 (Mar-Apr 1989). (CONF-8806312–: Symposium on coal-derived fuels - coprocessing, Toronto, Canada, 5-10 Jun 1988).

Initial coprocessing studies performed to provide a basis for studying mechanisms associated with the coprocessing of coal and residual oil are described. Areas investigated included the response of coal and petroleum resid combinations to processing under thermal hydrotreatment conditions, the means of increasing the conversion of coal, and the nature of resid demetalation effects. It was found that Maya ATB was superior to Boscan ATB or North Slope VTB for the conversion of Illinois No. 6 coal to liquid or soluble products. The extensive demetalation of the liquid product observed was a function of the amount of coal added. Results obtained by using different coal and resid combinations under thermal conditions and in the presence of various additives suggest that an adsorptive mechanism is operative. The primary interactions leading to demetalation appear to be between the metal complexes of the resid and the insoluble carbonaceous coal-derived material. Demetalation of the liquid product was not dependent on conversion of the organically complexed metal in the resids to inorganic form. 18 refs., 8 figs., 10 tabs.

35547 (ARC–1989, pp. 6) **Solubilization of coal by reductive and non-reductive alkylation in liquid ammonia.** Ignasiak, B. (Alberta Research Council, Edmonton); Gawlak, M.; Carson, D.; Cyr, N. Alberta Research Council, Edmonton, AB (Canada). [1989]. (CE–02438). In *Alberta Research Council [research reports].* Available from CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $3.40 CAN minimum, plus $0.25/p after 10 pages.

Though a large number of degradation reactions have been adopted for the study of coal substance, considerably less has been done to convert coal into soluble products with little, if any, covalent bond cleavage or molecular rearrangement. This communication describes two of the coal solubilization methods which meet this requirement and have been developed recently in the Alberta Research Council laboratories. The author discusses first reductive alkylation in liquid ammonia, while the results indicate that, for the high rank coals, reductive alkylation in tetrahydrofuran is comparable with what it is in liquid ammonia, the reliability of tetrahydrofuran alkylation for lower rank coals appears to be quite questionable. Non-reductive alkylation in liquid ammoniais also discussed. It appears that the reductive ethylation method, though it undoubtedly leads to some covalent bond cleavage, can be applied for the determination of the molecular weight distribution of a low rank bituminous coal. The non-reductive ethylation studies emphasized differences between Cretaceous and Carboniferous coals. The solubilities in chloroform of ethylated Carboniferous coals appear to be much higher as compared with their younger counterparts, though the number of ethyl groups introduced is of the same order. Furthermore, nuclear magnetic resonance seems to indicate that, in Carboniferous coals, the structural units mainly responsible for the alkylation are those of 9,10 dihydrophenanthrene and fluorene types. 7 refs., 2 figs., 2 tabs.

35548 (CRL–87-123(OP,TR)) **Methane desorption in coal handling.** Das, B. Canada Centre for Mineral and Energy Technology, Ottawa, ON (Canada). Nov 1987. 34p. Available from CANMET, 555 Booth St., Ottawa, Canada, K1A 0G1.

Methane desorption can cause problems in all areas of coal handling - mining, storage, transportation, preparation and utilization. In order to minimize the hazard it is necessary to have a clear understanding of the process of methane desorption. This paper discusses methane desorption characteristics with a view to reducing potential hazards. 7 refs., 16 figs.

35549 (CRL–88-23(OP,J)) **Coal dustiness: characterization and control.** Mikula, R.J.; Parsons, I.S. Canada Centre for Mineral and Energy Technology, Ottawa, ON (Canada). Mar 1988. 27p. Available from CANMET, 555 Booth St, Ottawa, Canada, K1A OG1.

This paper examines the problem of coal dustiness, and methods for its control. ASTM Test D547 is commonly used for evaluation of coal dustiness, however it is often ineffective in determining how well dust control agents will work in field situations. CANMET has developed, and provides information on, a number of alternative tests for coal dustiness. Results of a number of dust control tests are also included. 3 refs., 12 figs.

35550 (CRL–88-55(TR)) **Measurements of solids concentrations in coal slurries using microwaves.** Mansour, N.A. Canada Centre for Mineral and Energy Technology, Ottawa, ON (Canada). Aug 1988. 12p. Available from CANMET, 555 Booth St, Ottawa, Canada, K1A OG1.

This paper examines the potential use of microwaves in measuring solids concentration in a coal-water slurry. Dielectric data on coal and water are provided. The microwave absorption technique appears to provide better results than those obtained by dielectric measurements. 6 refs., 4 figs.

35551 (DOE/PC/79905–T7) **Fundamental research on surface science of coal in support of physical beneficiation of coal: Quarterly technical progress report, January 1–March 31, 1989.** Good, R.J.; Keller, D.V. Jr. State Univ. of New York, Buffalo, NY (USA). Dept. of Chemical Engineering. 1989. 26p. Sponsored by DOE Fossil Energy. DOE Contract AC22-87PC79905. Order Number DE89013104/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Research on coal surfaces continued. Our contact angle study of the decane-water-coal system has been extended using various ranks of coal. The study of the effect of surface oxidation on contact angles has also been extended to Upper Freeport, Illinois No. 6 and Kentucky No. 9 coals. Measurements of contact angles of liquid-air interfaces, on polished surfaces of coal of two different ranks, have been made using the captive drop technique. The data have been analyses using the acid/base theory. Some preliminary contact angle measurements have been made on rock pyrite, using the microscopic technique. The measurements were carried out for decane-water interfaces. A study of laboratory-scale agglomeration has been undertaken, using an Osterizer blender. The coals used were Illinois No. 6 and Kentucky No. 9. The effect of CO_2 on the agglomeration process has been looked into. Finally, the adsorption alcohols (cyclohexanol and n-octanol) from both aqueous and non-aqueous solutions, onto coal, has been measured. Two ranks of coal were used: Upper Freeport (mvb) and Illinois No. 6 (hvcb). 9 refs., 6 figs., 17 tabs.

35552 (DOE/PC/79907–T5) **Spectroscopic study of coal structure and reactivity: Quarterly report, January 1, 1989 to March 31, 1989.** Griffiths, P.R. California Univ., Riverside, CA (USA). Dept. of Chemistry. 10 May 1989. 10p. Sponsored by DOE Fossil Energy. DOE Contract FG22-87PC79907. Order Number DE89013684/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Several areas on the study of coal and coal extracts have been investigated. These are: the use of thin layer chromatography interfaced to diffuse reflectance infrared Fourier transform spectrometry (DRIFT); combined deconvolution and curve-fitting; diffuse reflectance spectrometry; air oxidation; and photoacoustic spectrometry. 3 figs. (CBS)

35553 (DOE/PC/79914–T5) **Macromolecular coal structure as revealed by novel diffusion tests: Quarterly technical report, January 15, 1989–April 15, 1989.** Peppas, N.A. Purdue Univ., Lafayette, IN (USA). School of Chemical Engineering. 1989. 29p. Sponsored by DOE Fossil Energy. DOE Contract FG22-87PC79914. Order Number DE89013100/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Experimental studies are reported of diffusion in thin sections of various coal samples. Data are presented of the transport of methylene chloride, chloroform, pyridine, methyl ethyl ketone, toluene, benzene, methanol, acetone and cyclohexane in coals PSOC 418, 853 and 384. The results are analyzed in terms of solubility parameters and the polar contribution to the solubility. 2 refs., 18 figs., 2 tabs.

35554 (DOE/PC/88925–T1) **Correlation of stability/rheology relationship with coal properties and chemical additives: Quarterly progress report, September 15, 1988–December 15, 1988.** Ohene, F. Grambling State Univ., LA (USA). Dept. of Chemistry. 1988. 11p. Sponsored by DOE Fossil Energy. DOE Contract FG22-88PC88925. Order Number DE89014504/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In an effort to establish a criteria for designing and preparing coal-water slurry (CWS) for utilization, the relationships between coal properties and slurry quality must be determined. These relationships will enable the prediction of potential CWS quality for the particular coal candidate from some characteristic(s) of the coal. The coal content at a given viscosity varies for different coal. Thus, to develop a viable coal selection strategy using chemical surfactants as additives, the adsorption of these surfactants by the coal particle surface must be established. This work therefore, intends to screen a number of chemical surfactants and dispersants which can be used in the preparation of coal water slurry. The information derived from this screening together with the coal properties will be used to help develop a prescription to predict the stability of coal slurries. 7 refs., 1 fig., 3 tabs.

35555 (DOE/PC/90502–11) **Catalyst accessibility in high volatile bituminous coal: Quarterly report.** Kispert, L.D. Alabama Univ., University, AL (USA). Dept. of Chemistry. Jul 1989. 7p. Sponsored by DOE Fossil Energy. DOE Contract FG22-86PC90502. Order Number DE89014117/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

As reported previously, an EPR technique has been developed in this lab to determine the pore size and number distribution in high volatile bituminous coal using nitroxide spin probes I-IX of different sizes, shapes and reactivity. This quarter, the Bruker EPR/ENDOR spectrometer (ESP 300-10/7 with an ESP 350-U ENDOR/TRIPLE accessory) was delivered and successfully installed. We are pleased that we have been successful in obtaining weak but interpretable ENDOR spectra from the EPR spin probe doped coal samples. 5 refs., 3 figs.

35556 (DOE/PC/90504–T10) **Configurational diffusion of coal macromolecules: Quarterly progress report, March 16–June 15, 1989.** Guin, J.A.; Curtis, C.W.; Tarrer, A.R. Auburn Univ., AL (USA). Dept. of Chemical Engineering. 1989. 15p. Sponsored by DOE Fossil Energy. DOE Contract FG22-86PC90504. Order Number DE89013782/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

During this quarter, work was centered on the study of etching characteristics of polycarbonate films having fission tracks. Etching curves for the polycarbonate films aged at room conditions for more than 6 months were obtained. The effects of several experimental parameters on the etching rate of the polycarbonate films were investigated also. It was observed that concentration of caustic solution and etching temperature affected significantly the etching rate of the polycarbonate films. The etching rates of damaged regions by fission fragments were faster than the etching rates of undamaged regions. 7 refs., 4 figs.

35557 (DOE/PC/90507–T11) **Surface properties of coal and their role in coal beneficiation: Technical progress report, March 15, 1989–June 14, 1989.** Fuerstenau, D.W. California Univ., Berkeley, CA (USA). Coll. of Engineering. Jul 1989. 11p. Sponsored by DOE Fossil Energy. DOE Contract FG22-86PC90507. Order Number DE89014166/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The main goal of this research is to delineate the wetting behavior of coal and its subsequent effects on fine coal processing. As both bulk and surface properties of coal are interrelated and have a controlling role in the performance of these processes, a detailed study has been undertaken to correlate their influence on both wetting behavior and the response of coal to flotation. During this current reporting period, the major effort was directed towards investigation of the effect of pH and oxidation on the induction time of coal.

35558 (DOE/PC/90508–T8) **Continuous thermodynamics and group contribution methods for coal liquids: Final report, October 1, 1986–October 1, 1989.** Allen, D.T.; Behmanesh, N.; Vajdi, L.E. California Univ., Los Angeles, CA (USA). Dept. of Chemical Engineering. 1989. 168p. Sponsored by DOE Fossil Energy. DOE Contract FG22-86PC90508. Order Number DE89011390/JAW. Available from NTIS, PC A09/MF A01 - OSTI; GPO Dep.

Structural profiles of narrow-boiling range fractions from three coal liquefaction processes were determined by identifying the major functional groups in the distillates and estimating their concentrations. The structural profiles were based on an extensive set of analytical data including results from elemental analysis, proton nuclear magnetic resonance, mass spectrometry, infrared

spectroscopy and liquid chromatography. The functional group distributions were then interfaced with group contribution methods for property estimation. Heat capacities, critical constants, activity coefficients, hydrogen solubilities and vapor pressures were estimated for the narrow boiling fractions. The predictions have been compared to the predictions of more conventional property estimation methods and to experimental data. In addition, sensitivity analyses have been performed to determine which structural features in the coal derived liquids are most important in estimating the values of thermodynamic properties. 43 refs., 16 figs., 59 tabs.

35559 (DOE/PC/90521–T10) **Role of porosity in supercritical fluid extraction of coal: Technical progress report.** Bale, H.D. North Dakota Univ., Grand Forks, ND (USA). Dept. of Physics. 15 Jun 1989. 11p. Sponsored by DOE Fossil Energy. DOE Contract FG22-86PC90521. Order Number DE89014727/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The major emphasis of our recent work has been directed towards establishing the role that the micropore structure plays in fluid extraction of coal. Specifically, we have contended that the micropore structure formed in the temperature range of 380°C acts as a "root system" that makes possible the intimate contact between the fluid and coal molecules required for extraction. In this report we will study the micropore swelling characteristics more closely making use of scattering theory and also by using large angle x-ray diffraction to examine possible changes in the graphite structure of the coal due to micropore formation or fluid imbition. In addition, we will discuss our small angle scattering measurements made on Pittsburgh No. 8 bituminous coal during fluid extraction. 5 figs.

35560 (DOE/PETC/TR–89/6) **Structural definition of synthetic fuels, Wilsonville I.** Perry, M.B.; Schmidt, C.E.; White, C.M. USDOE Pittsburgh Energy Technology Center, PA (USA). May 1989. 74p. Sponsored by DOE Fossil Energy. Order Number DE89013627/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This report summarizes the results of an in-depth characterization of products formed from Wilsonville Run 245. Specifically, the Thermal Hydrocracker, Catalytic Hydrotreater, and Thermal Hydrocracker vacuum still bottom products were further distilled into well-defined, narrow-boiling-range distillates. The physical, chemical, and thermodynamic properties of these distillates were measured, including specific gravity, refractive index, boiling point, elemental composition, viscosity, number-average molecular weight, and others. These results were then empirically correlated with one another. 25 refs., 15 figs., 30 tabs.

This report discusses recent research in Nova Scotia on the development of a packing system using fly ash and ordinary Portland cement. A review of the Parsonage Flashpack system (UK) is given and an outline of requirements for a successful packing system at Lingan Mine, N.S. is presented. Details of a proposed underground trial of the packing system, including associated costs and benefits, is also included. 4 refs., 2 tabs., 4 figs.

35562 (PB–89-169262/XAB) **Feasibility study of utilization of coal-mine refuse; Estill County, Kentucky.** Kentucky Univ., Lexington, KY (USA). Research Foundation. Aug 1976. 309p. Available from NTIS, PC A14/MF A01.

Portions of this document are not fully legible.

This report is a preliminary study of the physical and chemical characteristics of coal-mine refuse from eastern Kentucky bituminous coal stored in Estill County at the South-East Coal Company cleaning facility to determine the economic feasibility of commercial use of the refuse. The report covers refuse sampling, extensive analysis and testing, production of materials for use in the construction industry, market analysis for the materials that it would be feasible to produce, a preliminary capitalization plan, and flowsheet for light-weight aggregate production, and other factors.

35563 (PB–89-172183/XAB) **Cost impact of potential RCRA (Resource Conservation Recovery Act) changes on New York State Utility coal-waste disposal. Final report.** Kurgan, G.J. Baker (Michael), Jr., of New York, Inc., NY (USA). Nov 1983. 127p. Available from NTIS, PC A07/MF A01.

Presently, waste from coal burned by utility companies is exempted from regulations controlling hazardous wastes. The U.S. Department of Environmental Protection (EPA) is reconsidering these exemptions, and once the EPA study is completed, it is possible this exemption will be lifted and new, more-stringent hazardous waste disposal conditions will be put into effect. This report analyzes the cost effects of these contemplated new regulations. Two separate scenarios are considered. In the first scenario, extrapolated results for 1991 (in '83 dollars) show an increase from present estimated cost State wide of $87.7 million to $92.3 million, an increase by a factor of 1.1. Under scenario two, this $87.7 million would increase to $196 million in the same time, an increase by a factor of 2.2. Detailed tables are included for both scenarios and can be used to tailor the case studies to specific disposal sites.

35564 (TVA/RDG/EQS–89-2) **Development of dredged ash disposal area: Johnsonville Fossil Plant: Final environmental assessment.** Tennessee Valley Authority, Knoxville, TN (USA). Environmental Quality Staff. 1989. 65p. Order Number DE89014511/JAW. Available from NTIS, PC A04/MF A01 - OSTI.

Johnsonville Fossil Plant is located on the east shore of Kentucky Lake and is approximately 12 miles west of Waverly, Tennessee. The plant has 10 coal-fired units with a total generating capacity of 1485 megawatts. The first unit began operation in late 1951 and the tenth unit in 1959. The present coal ash disposal method at Johnsonville is sluicing fly ash and bottom ash to the active ash pond, which is 91 acres in size. This pond requires periodic dredging to maintain compliance with the NPDES permit free water volume requirement. The ash dredged from this pond has been hydraulically conveyed to settling ponds constructed in the rail loop area on the TVA reservation. With the current ash production at Johnsonville averaging 255,000 tons per year, the rail loop will reach maximum storage capacity in 1990. In order to continue future electrical generation at Johnsonville, the development of a new ash disposal area is needed by 1990. This assessment is to evaluate the environmental consequences associated with the development of a new area for dredged ash disposal and an associated small borrow area. 8 refs.

35565 (DOE/EIS–0146D) **Clean Coal Technology Demonstration Program: Draft Programmatic Environmental Impact Statement.** USDOE, Washington, DC (USA). Jun 1989. 293p. Sponsored by DOE Fossil Energy. Order Number DE89013883/JAW. Available from NTIS, PC A13/MF A01 - OSTI; GPO Dep.

The proposed action evaluated in this draft PEIS is to continue the Clean Coal Technology Demonstration Program (CCTDP) involving the selection, for cost-shared federal funding, of one or more clean coal projects proposed by the private sector. The draft PEIS addresses the potential environmental consequences of the widespread commercialization of the successfully demonstrated clean coal technologies by the private sector in the year 2010. This analysis of programmatic issues, along with additional environmental information and analysis containing business confidential or proprietary information, will be used by DOE in making decision on specific proposals during the selection process. The draft PEIS evaluates a no-action alternative, which assumes the CCTDP is not continued and conventional coal-fired technologies with conventional flue gas desulfurization controls would continue to be used, and a proposed action alternative which assumes that CCTDP projects are selected for funding and that successfully demonstrated technologies undergo widespread commercialization by the year 2010. The analysis of environmental consequences focuses on

changes to sulfur dioxide (SO_2), oxides of nitrogen (NO_x), carbon dioxide (CO_2), and solid wastes. An upper bound of change to each of these four parameters was estimated for each of 22 clean coal technologies, separately, assuming full penetration of potential markets. Potential effects of the CCTDP on land use, water resources, ecological systems, endangered and threatened species, socioeconomic resources, and human health and safety are also evaluates in the draft PEIS. 139 refs., 41 figs., 56 tabs.

35566 (NEI-NO–82, pp. 139-149) **Acidification of infiltration waters as a result of the seepage through carboniferous host-rocks.** Witczak, S.; Szczepanska, J. Norsk Hydrologisk Komite, Oslo (Norway). 1987. (CONF-870577–: International symposium on acidification and water pathways, Bolkesjo, Norway, 4-8 May 1987). In *Acidification and water pathways. Vol. 1. Proceedings of International symposium on acidification and water pathways, Bolkesjoe, 4-5 May 1987.* Order Number DE89766881/JAW. Available from NTIS (US Sales Only), PC A20/MF A01.

The formation of acid infiltration waters is presented. This process results from the oxidation of iron sulphides/pyrite mainly/which are the common accessory minerals in the Carboniferous host-rocks forming coal mine spoils in the area of Upper Silesian Coal Basin. The problem concerns large areas where the coal mine spoils are or will be deposited. It is predicted that between 1984 and 2000 about 900 mln cubic meters of spoils will be additionally deposited as a results of the extensive development of coal mining. Significant amounts of coal-mine spoils are deposited outside the controlled tips and are indusrtially utilized for road and hydrotechnical constructions. It causes the formation of numerous local sources of the pllution of the natural water environment. Transformation of waters infiltrating into coal mine spoils has been studied both ⁱn situand during lysimetric modelling investigated. Frech Carboniferous coal mine spoils and the spoils that bad been weathered for about 10 years were used in the lysimetric observations. The trans- formation of infiltrating waters indicates that even the 1,5 meter thick layer of coal mine spoils can produce acid waters for the decades of year. Analysis of natural pore solutions squeezed by using the pressure method supports the lysimetric observations. 4 figures, 1 table, 4 references.

35567 (CRL–88-26(TR)) **Data compilation report: strata deformation monitoring, No. 3 TBM tunnel, Donkin-Morien mine, N.S.** Aston, T.R.C.; Chipman, D.; Gallant, W.D. Canada Centre for Mineral and Energy Technology, Ottawa, ON (Canada). Mar 1988. 67p.

This paper presents a data base compiled from geotechnical data, collected by extensometer, to monitor strata deformation in the tunnel crown at Donkin-Morien Mine No. 3. The data base contains comprehensive geotechnical and rock/support interaction information concerning large diameter TBM drivages through interbedded coal measures strata. 6 refs., 4 figs., 6 append.

35568 (CRL–88-34(TR)) **The application of rock bolt design methods to a proposed 7 West crosscut, Prince Mine, Sydney Coalfield, N.S.** Aston, T.R.C.; Gallant, W.D. Canada Centre for Mineral and Energy Technology, Ottawa, ON (Canada). Jun 1988. 48p. Available from CANMET, 555 Booth St., Ottawa, Canada, K1A 0G1.

This paper examines the use of rock bolting techniques as primary/secondary support systems for use in both temporary and permanent roadways. Data was input to eight different rock bolt design methods to compare results and determine the best rock bolting system for use in a proposed 7 West crosscut at the Prince Mine in the Sydney Coalfield. Results indicate none of the existing methods can provide a definitive rock bolt system for use in coal measures strata. However, three possible options for use in the 7 West crosscut are presented. 15 refs., 6 tabs., 10 figs.

35569 (CRL–88-36(TR)) **Statistical analysis of collected times between failure and times to repair of Easi-Miner at Obed Mine.** Szymanski, J.K.; Williams, C. Canada Centre for Mineral and Energy Technology, Ottawa, ON (Canada). Jun 1988. 11p. Available from CANMET, 555 Booth St., Ottawa, Canada, K1A 0G1.

A computer model was developed to simulate the operation of the Easi-Miner with trucks in open pit mines. Production data were collected over a period of one year at Obed Mine. This paper focuses on a statistical analysis of time to repair, and time between failures data of Easi-Miner operation. 1 ref., 4 figs.

35570 (CRL–88-41(TR)) **A preliminary pH analysis of coal slurries from the Sydney Coalfield, N.S.** Campbell, M.J.; Corbett, G.R.; Aston, T.R.C. Canada Centre for Mineral and Energy Technology, Ottawa, ON (Canada). Jun 1988. 20p. Available from CANMET, 555 Booth St, Ottawa, Canada, K1A OG1.

In the process of examining the feasibility of using strata reinforcement techniques combined with overcoring to strengthen coal measures strata it was revealed that the settling characteristics of cement and chemical grouts was dependent on the pH of the host rock. This paper examines the pH conditions found in samples taken from three Sydney Coalfield mines. Results are largely presented in table and graph format. 2 refs., 4 tabs., 7 figs.

35571 (CRL–88-45(TR)) **Proposal for the development of a computerized guidance system for the Easi-Miner continuous mining machine.** Kempe, A.B.; Srajer, V. Canada Centre for Mineral and Energy Technology, Ottawa, ON (Canada). Jul 1988. 19p. Available from CANMET, 555 Booth St., Ottawa, Canada, K1A 0G1.

This paper proposes that a computerized guidance system for the 'Easi Miner' mining machine be developed. Factors affecting the accuracy of the system are identified and discussed. It is felt that the guidance system will improve the efficiency of the 'Easi-Miner' by reducing dependence on the operator's vision to distinguish between coal and waste, and through detection of significant changes in physical vibration of the miner while in operation. 6 refs.

35572 (CRL–88-48-(TR)) **Survey of microprocessor based performance monitoring devices in Canadian surface coal and oil sands mines in 1987.** Naidu, H.G. Canada Centre for Mineral and Energy Technology, Ottawa, ON (Canada). Jul 1988. 16p.

This paper documents the results of a survey conducted by CANMET to determine the acceptance and industry experience of microprocessor based devices used for monitoring surface mining equipment. Current and future usage of these devices is discussed. Although the industry has begun to recognize the effectiveness of the monitoring equipment it was determined that except for a number of older units many of the devices in use were still being evaluated. 6 refs., 3 tabs., 2 append.

35573 (CRL–88-49(J,TR)) **The selection, development and testing of an integrated truck/shovel management system.** Srajer, V.; Hick, L.; Sadler, W. Canada Centre for Mineral and Energy Technology, Ottawa, ON (Canada). Aug 1988. 22p. Available from CANMET, 555 Booth St., Ottawa, Canada, K1A 0G1.

This study was based on data obtained from a number of Canadian coal mining companies. Requirements for an on-board data acquisition system were determined and an integrated truck/shovel operating and management system was then developed and tested. Components of the system include: a computer simulation program, a dispatching program, an equipment information system, a data transfer system, a database system and mobile equipment location devices. 5 refs., 4 figs., 2 tabs.

35574 (CRL–88-57(IR)) **Technical note on the construction of stoppings or dams in the Sydney coalfield.** Haslett, G.A. Canada Centre for Mineral and Energy Technology, Ottawa, ON (Canada). Aug 1988. 25p. Available from CANMET, 555 Booth St., Ottawa, Canada, K1A 0G1.

This report briefly reviews why and how stoppings or dams are constructed in underground coal mines. To be effective stoppings/dams must seal off the migration of air or gases from one side of the barrier to the other, and must provide adequate protection from any explosions that might occur within the sealed off workings. Stopping procedures and guidelines from Australia, the US, the UK, and the Federal Republic of Germany are mentioned. 6 refs., 3 tabs., 4 figs.

35575 (PB–89-163430/XAB) **High-performance, intrinsically safe data-acquisition system for underground use. Final report, October 1984-December 1984.** Van Scoy, R.J. Serata Geomechanics, Inc., Richmond, CA (USA). Dec 1988. 77p. Available from NTIS, PC A05/MF A01.

This report describes a portable, intrinsically safe data acquisition system designed specifically for use in underground coal mines. The system is designed for high resolution and stability, and can accept a wide variety of transducer types without modification or accessories. Input units may be easily added to the system to expand it to a maximum of 240 input channels. Up to one megabyte of measurement data can be recorded by the system's Data Logger, which uses internal solid-state memory. Stored data can be transferred directly via modem to a host computer or copied into another unit for transportation to the surface. A user-friendly menu system displayed on a hand-held terminal allows simple control of recording and data-transfer functions. All system units are designed to meet drop-test, watertightness, and other environmental criteria to enhance reliability in field use. The report includes photographs of the equipment and plots of data taken in laboratory and field tests. It also discusses system-design considerations, the electronic design of each system unit, and system firmware and documentation.

35576 (PB–89-166961/XAB) **Roofbolt support in board and pillar workings.** Merten, W.N. National Mechanical Engineering Research Inst., Pretoria (South Africa). Geomechanics Div. 23 Oct 1987. 11p. Available from NTIS, PC EE04/MF E04.

North American Continent sales only.

Roof-support requirements in board and pillar workings were examined. These investigations focused on the two problem areas of the influence of strata conditions on the behavior of different types of roof bolts, and the prediction of load-bearing capacities of mainly mechanically anchored expansion shell roofbolts. Both areas are interrelated through the strength of the rock strata, which has a distinct influence on the behavior of the different types of roof bolts.

35577 (DOE/PC/90956–T8) **Advanced instrumentation for local measurement of gas-solid suspension flows: Quarterly technical progress report No. 9/10, November 1, 1988–April 30, 1989.** Ling, S.C.; Pao, H.P.; Zhang, X.S. Catholic Univ. of America, Washington, DC (USA). 1989. 18p. Sponsored by DOE Fossil Energy. DOE Contract FG22-86PC90956. Order Number DE89014437/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

An advanced optical technique has been developed for the measurement of suspended-solid flows. This permits one to do more detailed experimental observations and analyses on the mechanics of sedimentary flows. In this study, the existence of micro-hairpin vortices as a major mechanism for the lifting of solid particles from the flow boundary has been identified. The lifting effect can be represented as a source term, the sedimentary flow problem may now be solved in a closed form, i.e., to have a steady-state solution. A preliminary parameterization for the problem is presented. 9 refs., 7 figs.

35578 (DOE/PC/90958–T8) **Studies of dense phase cohesive coal transport in plugs: Quarterly report, April–June 1989.** Klinzing, G.E. Pittsburgh Univ., PA (USA). Dept. of Chemical and Petroleum Engineering. 1989. 15p. Sponsored by DOE Fossil Energy. DOE Contract FG22-86PC90958. Order Number DE89013683/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The experimental and analytical studies of horizontal transfer of pulverized coal in plug form were conducted in 2 inch PVC pipe for 15 feet of transfer. The pressure losses variation with plug and gas velocity were investigated and the operational parameters to obtain fine powder transported in a plug form were determined. It was found that the pressure drop across the plug behaved in exponential or linear fashions depending on the plug length. A model was proposed to predict the pressure drop across the plug and was found to agree within ±20 percent of the experimental results. 5 refs., 5 figs.

35579 (TVA/PUB–88/16) **Coal traffic on the Tennessee River Waterway to year 2000.** Navigation and System Modification, Knoxville, TN (USA). [1989]. 22p. Sponsored by Tennessee Valley Authority. Order Number DE89014204/JAW. Available from NTIS, PC A03/MF A01 - OSTI.

The purpose of this paper is to examine the short-term future prospects for major industrial coal movements on the Tennessee River Waterway. The discussion centers on the historical and current volume of TVA coal and coal traffic of other major shippers that utilize the Tennessee River system as their primary means of transportation. Emphasis is placed on estimating future TVA Tennessee River coal traffic when nuclear power is restored and becomes the base load in the TVA power system. Export coal products are also briefly discussed. The paper is based on coal forecasts in the March 1988 "Commodity Traffic and Benefit Study for Navigation Improvements on the Upper Tennessee River," and information provided by TVA's Fossil Fuels Planning Branch. It should be useful in planning to meet the requirements of coal movements on the Tennessee River system to the year 2000. 8 figs., 2 tabs.

35580 (CONF-881202–4) **Contribution of dynamics and erosion for small tube arrays in fluidized beds.** Lyczkowski, R.W.; Bouillard, J.X.; Chang, Shen-Lin; Folga, S. Argonne National Lab., IL (USA). Feb 1989. 33p. Sponsored by DOE Fossil Energy. DOE Contract W-31109-ENG-38. From 5. Miami international symposium on multi-phase transport and particulate phenomena; Miami Beach, Florida, USA; 12-14 Dec 1988. Order Number DE89013648/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The erosion issue in both atmospheric and pressurized fluidized bed combustors (AFBC's and PFBC's) has received increased attention in the last several years. The problem of erosion (more generally referred to as metal wastage) is so severe that in some cases the lifetime of tubes is as little as several thousand hours. The problem is international in scope and is hampering the commercialization of AFBC's and PFBC's for burning coal in a clean manner. The purpose of this paper is to discuss Argonne National Laboratory's (ANL's) current state-of-the-art computational capabilities in predicting erosion of fluidized bed tube arrays. Hydrodynamic calculations were performed for generic few tube approximations of the Coal Research Establishment's cold model erosion experiment. Predicted solids-gas velocities and void fractions, using FLUFIX computer code, were used as inputs to three erosion models — The monolayer energy dissipation erosion model, the extended Finnie impaction erosion model, and the combined ductile-brittle Neilson-Gilchrist erosion model — All erosion models predict order of magnitude agreement with each other and with liquid erosion data. However, the monolayer energy dissipation model produces more reliable trends of overall erosion rates. 31 refs., 12 figs., 1 tab.

35581 (DOE/MC/23253–2679) **Secondary atomization of coal-water fuels for gas turbine applications: Final report.** Yu, T.U.; Kang, S.W.; Beer, J.M. Massachusetts Inst. of Tech., Cambridge, MA (USA). Dec 1988. 101p. Sponsored by DOE Fossil Energy. DOE Contract AC21-86MC23253. Order Number DE89000970/JAW. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

The main research objective was to determine the effectiveness of the CWF treatments on atomization quality when applied to an ultrafine coal-water fuel (solids loading reduced to 50%) and to gas turbine operating conditions (atomization at elevated pressures). Three fuel treatment techniques were studied: (1) heating of CWF under pressure to produce steam as the pressure drops during passage of the CWF through the atomizer nozzle, (2) absorption of CO_2 gas in the CWF to produce a similar effect, and (3) a combination of the two treatments above. These techniques were expected to produce secondary atomization, that is, disruptive shattering of CWF droplets subsequent to their leaving the atomizing nozzle, and to lead to better burnout and finer fly ash size distribution. A parallel objective was to present quantitative information on the spray characteristics (mean droplet size, radial distribution of droplet size, and spray shape) of CWF with and without fuel treatment, applicable to the design of CWF-burning gas turbine combustors. The experiments included laser diffraction droplet size measurements and high-speed photographic studies in the MIT Spray Test Facility to determine mean droplet size (mass median diameter), droplet size distribution, and spray shape and angle. Three systems of atomized

sprays were studied: (1) water sprays heated to a range of temperatures at atmospheric pressure; (2) CWF sprays heated at atmospheric pressure to different temperatures; and (3) sprays at elevated pressure. 31 refs., 47 figs., 1 tab.

35582 (DOE/PC/60419–T10) **Development of a pulsed coal combustor fired with CWM [coal-water mixture]: Phase 3, Final report.** Mansour, M.N.; Durai-Swamy, K. Management and Technical Consultants, Inc., Columbia, MD (USA). Nov 1986. 456p. Sponsored by DOE Fossil Energy. DOE Contract AC22-83PC60419. (MTCI–10011-RO178). Order Number DE89008271/JAW. Available from NTIS, PC A20/MF A01 - OSTI; GPO Dep.

This report presents the results of an R and D program aimed at developing a new burner technology for coal-water mixture (CWM) fuels to enable the substitution of these new fuels in utility and industrial boilers and process heaters currently firing oil and gas. The application of pulse combustion to CWM fuels is chosen to alleviate many of the physical plant and environmental constraints presently associated with the direct use of these fuels in equipment designed for oil and gas firing. Pulse combustion has been shown to be capable of high-intensity burning of coal for acceptably complete combustion within relatively small equipment volumes. It also has the inherent capability to agglomerate ash particles, thus rendering ash more easily separable from the combustion gas prior to its entrance into the convective section of the boiler or heater, thereby reducing ash buildup and pluggage. Pulse combustion is also well-suited to staged combustion for NO_x control and has excellent potential for enhanced in-furnace SO_2 removal due to the enhanced levels of mass transfer brought about by the vigorous flow oscillations. The primary objective of the Phase 2 work was to develop a detailed program for laboratory development and evaluation of the pulse CWM combustor and system design concepts. 112 refs., 40 figs., 94 tabs.

35583 (DOE/PC/79909–6) **Pyrite thermochemistry, ash agglomeration, and char fragmentation during pulverized coal combustion: Quarterly report, December 15, 1988–March 15, 1989.** Akan-Etuk, Nniefiok; Niksa, S.; Kruger, C.H. Stanford Univ., CA (USA). High Temperature Gasdynamics Lab. May 1989. 18p. Sponsored by DOE Fossil Energy. DOE Contract FG22-87PC79909. Order Number DE89013083/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

During the first quarter of 1989, we implemented the synthesis and classification procedures developed in past quarters to produce substantial amounts of samples for the pyrite thermochemistry studies. Two materials were generated, raw pyrite with relatively large mean sizes, for the studies of extraneous pyrite oxidation under simulated p.f. firing, and pyrite-loaded synthetic chars without macrovoids, for the studies of the oxidation of adventitious pyrite inclusions. Raw pyrite of a median size of 25 microns was produced with a two-stage classification scheme. Pyrite-loaded, non-macroporous synthetic chars were also produced. In the course of processing large amounts of samples, several potential improvements in the procedures were recognized, characterized, and implemented. Also, a new method to measure the pyrite loading was developed, to verify the loadings inferred from the density classification. 13 figs.

35584 (DOE/PC/88900–4) **An engineering model for coal devolatilization: Quarterly report, December 15, 1988–March 15, 1989.** Lau, Chun Wei; Niksa, S. Stanford Univ., CA (USA). High Temperature Gasdynamics Lab. May 1989. 14p. Sponsored by DOE Fossil Energy. DOE Contract FG22-88PC88900. Order Number DE89014559/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

During this reporting period, we concentrated on our new theory for rapid coal devolatilization. This theory invokes flash distillation driven by competitive kinetics for depolymerization and reattachment to explain the influences of all important operating conditions. Its parameters which describe the initial configuration and molecular structure of coal are related to the structural characteristic which can be inferred from ^{13}C NMR analyses, so that the theory provides a basis for describing the devolatilization behavior of various coal types. At this point, however, the data correlations are restricted to Pittsburgh Seam HVA bituminous coals, for which data representing very broad variations in the opening conditions are available in the open literature. The data correlations included here represent variations in temperature to 1200K, heating rates from 1 to 10^3K/s, reaction times at constant temperature to 30 s, and pressures from vacuum to 25 atm. Obviously, such broad variations comprise a stringent validation of the theory, especially since the yields of gas and tar as well as the molecular weight distributions (MWDs)of tar are brought into the evaluations. The progress on the other aspects of this program is also reviewed, but briefly. Here we focus on a phenomenological description of the new devolatilization theory, and the evaluations against measured devolatilization behavior. 11 refs., 5 figs., 1 tab.

35585 (DOE/PC/88910–T1) **Detoxification and generation of useful products from coal combustion wastes: Quarterly technical report, [October–December 1988].** Arkansas Tech Univ., Russellville, AR (USA). Arkansas Mining and Mineral Resources Research Inst. 1988. 10p. Sponsored by DOE Fossil Energy. DOE Contract FG22-88PC88910. Order Number DE89014503/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This quarter, samples of dry fly ash, wet bottom ash, and desulfurization gypsum slurry were provided from an Ohio Edison power plant. Chemical analysis mineralogical examination, and an anion analysis were performed on the samples. 2 figs., 1 tab. (CBS)

35586 (DOE/PC/90753–T12) **Coal ash deposition, interaction with metal substrates and deposit build up: Summary report, 26 February 1989–25 May 1989.** Birks, N. Pittsburgh Univ., PA (USA). Dept. of Materials Science and Engineering. [1989]. 19p. Sponsored by DOE Fossil Energy. DOE Contract FG22-86PC90753. Order Number DE89014116/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

During the period covered by this report the effect of the presence of oxide phases and time of exposure to air + 1% SO_2 at 700°C were explored to determine how attack of the metal substrates by the ash deposits is initiated. The observations of cross sections of specimens 304 stainless steel exposed for 1, 2 and 4 hours to the above conditions are discussed. These observations taken at relatively short times are critical to the development of understanding of how the strong intergranular attack, previously reported for longer exposures, is initiated. 8 figs.

35587 (ERL–87-92(TE)) **Tube wastage in FBC boilers at Summerside - causes and resolution.** Razbin, V.V.; Friedrich, F.D. Canada Centre for Mineral and Energy Technology, Ottawa, ON (Canada). Dec 1987. vp. Available from CANMET, 555 Booth St, Ottawa, Canada, K1A OG1.

Through a demonstration project at the fluidized bed combustor at the Canadian Forces Base Summerside, Prince Edward Island, it was determined that there was a definite operational problem due to erosion of the heat exchange surface exposed to the bed. This paper provides data on the metal wastage in the Summerside boiler, and steps taken to resolve the problem. Two configurations of protective hardware were found to be particularly effective - closely spaced pin studs on the waterwells, and longitudinal rods, five per tube, on the inbed tubes. This paper also describes a current experiment with the inbed tube bundle, which involves an alloy, two types of protective hardware, and a change in tube bundle. 3 refs., 5 tabs., 20 figs.

35588 (ERP/ERL–86-56(TR)) **Final report on the comparative combustion properties of raw and washed Prince Mine coal.** Banks, G.N.; Wong, J.K.L.; Whaley, H. Canada Centre for Mineral and Energy Technology, Ottawa, ON (Canada). Sep 1986. 57p. Available from CANMET, 555 Booth St., Ottawa, Canada, K1A 0G1.

Pilot scale combustion trials were conducted on a number of raw and cleaned coals. Chemical, physical, petrographic and thermogravimetric analyses were performed on the coal samples. Although, all of the coals ignited easily to produce stable flames at greater than 96% combustion efficiency, the highest combustion efficiencies (>99%) were obtained with the more finely ground coal feeds. The two washed coals with the lowest ash content gave the higher combustion efficiencies, however the raw coal which has the lowest fly ash combustible content, also gave a combustion efficiency greater than 99%. 2 refs., 20 tabs., 10 figs., 1 append.

35589 (ETDE-mf–9788276) **Process and system for combustion, especially of slow-reacting coal dust.** Bruecher, K.; Wenz, W. Gewerkschaft Sophia-Jacoba, Hueckelhoven (Germany, F.R.); Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.). Dec 1987. 93p. (In German). Order Number DE89788276/JAW. Available from NTIS (US Sales Only), PC A05/MF A01.

1.

Coal might well be a substitute for imported petroleum and natural gas on the heat, process heat, and district heating market if coal-fired plants with high efficiency and ease of servicing were available. In order to develop a burner for low-volatility coal dust, a cold state model was set up at Siemens/KWU and a high-temperature test burner at Gewerkschaft Sophia-Jacoba. The burner is equal to oil and gas burners in terms of comfort (on/off regime). Further investigations are required into dust removal from the dry ash, NO_x concentrations to be expected with bigger combustion chambers and higher wall temperatures in the afterburner, and flue gas desulphurization. These problems are to be solved during trial operation of a demonstration plant. (MOS).

35590 (PB–89-162374/XAB) **Report on the combustion of screened duff coal in a chain-grate stoker-fired boiler.** Engelbrecht, A.D. National Inst. for Coal Research, Pretoria (South Africa). 1987. 11p. Available from NTIS, PC EE04/MF E04.

North American Continent sales only.

The possibility of burning screened duff in a chain-grate stoker-fired boiler was investigated. It was decided to screen at -3 mm, since the -3 mm fraction of the coal causes the most problems during chain-grate stoker firing. Screening at -2 mm or even -1 mm could also reduce operating problems to acceptable levels, but it becomes very difficult to screen at these sizes. For the scheme to be feasible, some use will have to be found for the -3 mm fraction, viz. briquetting or small-scale P.F. firing on the same site. These aspects are currently being investigated. Several combustion trials as well as four fuel efficiency tests at 80% and 100% of MCR were carried out.

35591 (PB–89-180921/XAB) **Development of a vortex-containment combustor for coal-combustion systems. Report for January 1980-December 1983 (Final).** LaFond, J.F.; Heap, M.P.; Seeker, W.R.; Tyson, T.J. Energy and Environmental Research Corp., Irvine, CA (USA). Mar 1989. 120p. Available from NTIS, PC A06/MF A01.

See also DE88016249.

This report describes the development of a vortex-containment combustor (VCC) for coal-combustion systems, designed to solve major problems facing the conversion of oil- and gas-fired boilers to coal (e.g., derating, inorganic impurities in coal, and excessive formation of NOx and SOx). The system would: have a high firing density, separate and retain fly ash, and be adaptable to viable pollution-control technologies. An extensive literature review and tests of two candidate isothermal systems preceded the design and construction of a bench-scale VCC. Coal-combustion tests were performed on the VCC to evaluate its performance in terms of ash-retention efficiency, coal burnout, combustion stability, and slag and ash deposition. Results were very promising for both retention efficiency and combustion stability. Fuel-injector modifications improved internal slag-deposition conditions while maintaining acceptable carbon burnout levels. NOx control by staging and reburning technologies was evaluated in the VCC, along with sorbent injection for the control of SO_2 emissions. Both staging and reburning were effective in reducing NOx emissions in the VCC. Improvements in the sorbent injection approach are required to obtain an acceptable degree of SO_2 reduction. Based on particle force balance expressions, scaling criteria have been established for the VCC.

35592 (SAND–89-8241) **Coal combustion science: Quarterly progress report, January–March 1989.** Hardesty, D.R. (ed.). Sandia National Labs., Livermore, CA (USA). Jul 1989. 92p. Sponsored by DOE Fossil Energy. DOE Contract AC04-76DR00789. Order Number DE89013908/JAW. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

Research on coal combustion is described. Research areas include: (1) Coal Devolatilization – The objective of this task is to characterize the physical and chemical processes that constitute the early devolatilization phase of coal combustion as a function of coal type, heating rate, particle size and temperature, and gas phase temperature and oxidizer concentration. (2) Coal Char Combustion – The objective of this task is to characterize the physical and chemical processes involved during coal combustion as a function of coal type, particle size and temperature, and gas temperature and oxygen concentration. (3) Fate of Mineral Matter During Coal Combustion – The objective of this task is to establish a quantitative understanding of the mechanisms and rates of transformation of mineral matter in coal combustion environments as a function of coal type, particle size and temperature, the initial forms and distribution of mineral species in the unreacted coal, and the local gas temperature and composition. A particular goal is determining the importance of fragmentation in the evolution of the particle size distribution during coal combustion. 23 refs., 38 figs., 23 tabs.

35593 (STEV-FBT–89-2) **Modelling of sulphur dioxide capture in fluidized bed combustion.** Lyngfelt, A. Statens Energiverk, Stockholm (Sweden). 1989. 16p. (CONF-8611288–: IEA and AFBC workshop on FBC mathematical modelling, Liege, France, 7 Nov 1986). Order Number DE89776265/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The paper discusses the relation between SO_2 models and comprehensive fluidized bed models. By comprehensive models is here meant complex models treating the hydrodynamics and combustion reactions in a fluidized bed. SO_2 models can be both independent models and component models in comprehensive models. The purpose of this paper is to illuminate the connection between SO_2 models and comprehensive models. The paper discusses: - what kind of information is exchanged between the SO_2 model and the comprehensive model. - to what extent the SO_2 model can be used as an independent model. - how an SO_2 model may be included in a comprehensive model. The situation can be summed up as follows: - The SO_2 models may be developed further without involving comprehensive models. - At present the role of a comprehensive model would be to supply the SO_2 model with data concerning lime particle residence times and attrition rates. - At a later stage of model development the SO_2 models may need to be included in comprehensive models in order to deal with phenomena of chemical nature. (46 refs.).

35594 (STEV-FBT–89-5) **Modelling of sulphur dioxide capture in fluidized bed combustion.** Lyngfelt, A. Statens Energiverk, Stockholm (Sweden). May 1986. 20p. Order Number DE89776262/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

There are two main objectives of increasing the understanding of limestone sulphation mechanism in fluidized beds by means of mathematical modelling . These are: - Prediction of the sulphur retention of a certain limestone in a given fluidized bed based on data for the limestone from laboratory tests. - Increasing the calcium utilization efficiency at a given calcium to sulphur ratio. The modelling in the present work is an attempt to find simple and logical model formulations. The basis in this modelling is the 'simple model'. In the simple model the degree of conversion of the lime is calculated as a function of only four parameters. These are: maximum degree of sulphation, X_{cc}, reaction rate constant, k, limestone average residence time, tau_c, and average sulphur dioxide concentration, c_s. A simple model has some important features: - It facilitates numerical solutions. - It provides a good basis for interpreting the result of more complex modelling. The simple model is applied in three ways to a two-phase fluidized bed reactor model. The first is at steady state with sulphur release in the emulsion phase. The second is at steady state with the sulphur dioxide already part of the gas entering the fluidized bed. The third is transient with respect to limestone feeding with sulphur released in the emulsion phase. (20 refs.).

35595 (LA-UR–89-1633) **Economics of selected energy applications of peat in Panama and Costa Rica.** Thayer, G.R.; Ramirez E., O.; Ramirez, A. Los Alamos National Lab., NM (USA). 1989. 15p. DOE Contract W-7405-ENG-36. (CONF-8903135–1:

Costa Rica symposium, San Jose, Costa Rica, 6-9 Mar 1989). Order Number DE89012613/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Studies were performed to determine the economic competitiveness of peat in Costa Rica and Panama. The cases examined were (1) electrical production in Panama, and (2) industrial boilers and cement plants in Costa Rica. Based on estimates of peat mining costs and the end-use costs we calculated for each application, the price of coal and oil at which the levelized life cycle cost of energy using peat was the same as that when coal or oil was used. We found that a peat-fueled power plant in Panama would be economic if the price of fuel oil was above $0.10 per liter and the cost of coal was above $40.00 per metric ton delivered. In Costa Rica, peat was competitive with fuel oil for large boilers (34,000 kg of steam per hour) when the cost of oil was above $0.10 per liter. For smaller boilers (5,000 kg of steam per hour) peat was cheaper than fuel oil when oil was above $0.08 per liter. Peat would be competitive in a cement plant when fuel oil prices were above $0.075 per liter. 5 figs.

35596 (ETDE-mf–9788274) **Improvement of work safety and strain reduction when equipping thin faces through the development and testing of a turning and swinging installation for shield support units. Final report.** Golomski, K.H. Ruhrkohle A.G., Essen (Germany, F.R.); Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.). Dec 1988. 22p. (In German). Order Number DE89788274/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

When equipping the face the turning and swinging activity of shield support units, particularly in thin seams, represent a considerable strain. With a stoop the face team has to bring the shields into the right position at the installation point using heavy compressed air hoisting gear. The physical- and safety-related strain may be reduced by the use of a turning and swinging installation swinging the support units into the direction of face advance and secures them until they are safely staked against the roof. Thus a turning and swinging installation was developed and tested under this project. The installation met the requirements related to the swinging and securing process. Safety at the workplace was guaranteed. A strain reduction of the face team could be proven in an accompanying medical examination. (orig.) With 2 tabs., 10 figs.

35597 (INIS-mf–11457(v.1,2) v. 1) **Radon concentrations in air of Polish underground coal mines.** Chruscielewski, W. (Inst. of Occupational Medicine, Lodz (Poland)); Zorawski, A.; Olszewski, J.; Domanski, T. Canadian Nuclear Association, Toronto, ON (Canada). 1985. (CONF-841016–: International conference on occupational radiation safety in mining, Toronto, Ontario, Canada, 15-18 Oct 1984). In *Occupational radiation safety in mining. Proceedings of the international conference (in two volumes).* Order Number DE89619926/JAW. Available from NTIS (US Sales Only), PC A99/MF A01 - OSTI; INIS.

In all underground Polish coal mines the survey of radon concentrations was done. So-called environmental cassette system (ECS) with the passive track detector type Kodak LR-115 was used. The cassettes were placed in mines typical work-places, transportation roads and cross-adits for the time of 1 month. Altogether 870 measurements were performed in 71 underground mines. The mean radon concentration is 0.74 $kGq.m^{-3}$ with variability range from 0 up to 14.8 $kBq.m^{-3}$, occasionally. The paper presents the distribution of observed concentrations in each mine and also contains the authorised levels and limits actually used in Poland.

35598 (ETDE-mf–9788047) **Formation and development of deposits in salt strata. Final report.** Neugebauer, H.J.; Wallner, H. Technische Univ. Clausthal, Clausthal-Zellerfeld (Germany, F.R.). Inst. fuer Geophysik; Ministerium fuer Wissenschaft und Kunst des Landes Niedersachsen, Hannover (Germany, F.R.). 24 Nov 1987. 38p. (In German). Order Number DE89788047/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The tectonic development in a sedimentary basin and the resulting physical conditions as a cause of the mobility of hydrocarbons and salt rock are explained. Finally numerical calculation examples on the dynamism and thermionics of salt structures are discussed. They clearly show that stress and temperatures in connection with salt structures can be localized and that a mechanical loading of the surface rock by the salt leads to the formation of oil traps. The calculations explicitly describe the dynamic and thermal aspect of prospecting and focus the interest on the structure zone below great salt concentrations.

35599 (AOSTRA–8808, pp. 10) **The thick-getting mechanism and characteristics of terrestrial heavy oil pools in China.** Shubao, X. (RIPED, Beijing, China); Jiayu, N. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

In the oil-bearing basins of China, tectonic movements have caused some oil pools to be lifted or destroyed, and some to come into contact with hydrogeological systems. In these open systems, crude oils were biodegraded, washed and oxidized, forming a large quantity of heavy oil and oil sand deposits. Samples collected from Chinese oil fields, notably those in the Shuguang area, were selectively analyzed. Based on the analytical results and other geologic data, the mechanism for petroleum thickening, the types of heavy oil deposits, and their distribution, are discussed. The gradual changes in physical and geochemical properties of oil samples undergoing different levels of biodegradation and washing are observed and classified into five stages, with the chemical changes occuring in each stage described. Three typical types of heavy oil pools and their geological features are summarized systematically, along with descriptions of the types of geologic traps encountered. The spatially distributed style and structure of the open system of a basin controls the distribution of the various types of oil pools. The dustpan-like depressions of the Bohai bay basin are taken in this paper as an example in order to study this spatial distribution. 4 refs., 6 figs.

35600 (DOE/BC/14425–1) **Establishment of an oil and gas database for increased recovery and characterization of oil and gas carbonate reservoir heterogeneity: Technical progress report, April 19, 1989–June 30, 1989.** Mancini, E.A. Alabama Geological Survey, University, AL (USA). 1989. 12p. Sponsored by DOE Fossil Energy. DOE Contract FG22-89BC14425. Order Number DE89014843/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The objective of this project is to augment the National Reservoir Database (TORIS database) and to increase our understanding of geologic heterogeneities that affect the recoveries of oil and gas from carbonate reservoirs in the State of Alabama and to identify those resources that are producible at moderate cost. This objective will be achieved through detailed geological, geostatistical, and engineering characterization of typical Jurassic Smackover Formation hydrocarbon reservoirs in selected productive fields in the State of Alabama. These studies will be utilized to develop and test mathematical models for prediction of reservoir heterogeneities. 3 figs.

quarter 1989. USDOE Energy Information Administration, Washington, DC (USA). Office of Oil and Gas Statistics. 20 Jun 1989. 36p. Sponsored by DOE Management & Administration. Order Number DE89014438/JAW. Available from NTIS, PC A03/MF A01 - GPO - OSTI.

This is the second in a new series of quarterly reports prepared by the Energy Information Administration (EIA). The systematic tracking of international oil and gas exploration and development activities provides a means for monitoring the location and magnitude of significant new discoveries of oil and natural gas. This effort is intended to identify new sources of future oil and gas supplies. Specific information regarding the preparation or contents of this publication may be obtained from John H. Wood or Gary R. Long of the EIA Dallas Field Office; telephone (214-767-2200). 11 refs., 6 figs.

35602 Tectonism, subsidence, and fracturing of Mesaverde reservoirs in the Piceance basin, Colorado. Lorenz, J.C. (Sandia National Labs., Albuquerque, NM (USA)); Finley, S.J.; Norman, D.I. *AAPG (American Association of Petroleum Geologists) Bulletin (USA),* 72(2): 215 (Feb 1988). (CONF-880301–: Annual meeting of the American Association of Petroleum Geologists, Houston, TX, USA, 20-23 Mar 1988).

Cretaceous strata in the Piceance basin of northwestern Colorado were subjected to several phases of tectonic, burial, and uplift stress. However, extensive data on fractures in core from the US Department of Energy's Multiwell Experiment (MWX) wells suggest that most of the fractures in the Cretaceous strata in this part of the basin originated during one episode of stress. Time-depth relationships, fracture orientations, and fluid inclusion analyses all indicate that fracturing occurred about 35-40 m.y. during Laramide west-northwest horizontal compression. Most Cretaceous rocks at the MWX site contain a single set of west-northwest extension fractures. Isochore calculations indicate trapping pressures around 325 bars for fluid inclusions in 16 samples of quartz and calcite mineralization from the fractures, suggesting that mineralization occurred in a pressure-temperature regime compatible with the reconstructed burial depths of 10,000-12,000 ft. Younger episodes of stress are recorded in both the post-Cretaceous strata and in the less deeply buried Cretaceous strata near the basin boundaries. However, the effects of these younger stresses are not evident in deeply buried Mesaverde reservoirs at the MWX site in the east-central part of the basin. Moreover, if the orientation of the horizontal compressive stress rotated significantly during the late Laramide, as suggested by some authors, its effects are not apparent in the Cretaceous formations examined. Most measurements of ancient and present-day stress in Mesaverde strata at the MWX site indicate only west-northwest Laramide compression.

35603 (AOSTRA–8808, pp. 27) **Experimental design for non-equilibrium immiscible carbon dioxide flood.** Lozada, D. (Univ. of Alberta, Edmonton, AB, Canada); Farouq Ali, S.M. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

This paper presents scaling criteria for designing immiscible carbon dioxide laboratory experiments for realistically simulating a given oilfield. A normal feature of the new scaling criteria is that they allow for partial, rather than complete, equilibrium among the oil, water and gas phases. Starting with the partial differential equation governing the flow of carbon dioxide, heavy oil and water, with partial equilibrium among the phases, a set of similarity groups is derived by inspectional analysis. New dimensionless groups for the explicit interface mass transfer parameters are derived. Six different approaches are presented for selecting the scaling criteria for a given type of experiments. For each case, the out-of-a-scale groups are tabulated. It is further shown by detailed example from the Alberfeldy-Lloydminster reservoir how an experiment is designed once a particular scaling approach is chosen. Guidelines are provided for choosing the experimental operating conditions for realistic simulation of field conditions. 17 refs., 2 figs., 16 tabs.

35604 (AOSTRA–8808, pp. 18) **Heavy oil recovery through immiscible displacement by carbon dioxide.** Murtada, H. (VEBA OEL AG., Gelsenkirchen, Germany); Meyn, V.; Hollerbach, A.; Swaid, I. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

Selected results are presented from a laboratory program performed to assess the capability of carbon dioxide as a steam-additive to enhance the recovery of oil from a shallow Canadian heavy oil reservoir. Other objectives of the laboratory program were to study the mechanisms involved in displacing heavy oil by carbon dioxide and to generate reliable laboratory data on pressure-volume-temperature (PVT) behavior and recovery performance for the use in the numerical simulation. Special PVT and flood equipments were used for conducting the laboratory experiments at high temperatures and high pressures. In linear displacement experiments, effluent oil was analyzed to determine whether changes in the oil composition occurred when the heavy oil under study was displaced by carbon dioxide. At low flood velocity oil composition in the flood front differed substantially from that originally used to saturate the cores. A simple numerical model corroborates that displacement of heavy oil by carbon dioxide in a linear model is controlled by diffusion. 25 refs., 10 figs., 4 tabs.

35605 (AOSTRA–8808, pp. 9) **Laboratory examinations of a new downhole steam generator.** Spilrain, E.E. (Inst. of High Temperatures, Academy of Sciences, Moscow, USSR); Pinhasik, D.S.; Kachalov, V.V.; Granovsky, J.A.; Moscov, A.S.; Toth, M.; Magyar, M.; Laszlo, R.; Rakar, G. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

A new downhole steam generator system has been developed, the steam generating unit of which was manufactured in the USSR while the other equipment was manufactured in Hungary. Laboratory tests and experiments were carried out, including use of a well simulator, to examine various aspects of system performance prior to possible industrial application. The operating stability of the generating unit when using gas or liquid fuels was examined. The parameters necessary for establishment of the operational control and regulation system were determined in the case of field operation. The common operation of the steam generating unit and that of the well equipment connecting it to the hermetic cable connector, and the double packed packer, were tested. Further testing was carried out in a well simulator, and these investigations were expanded to the modelling of change in formation injectivity, and to the evaluation of the effect of pressure increase and fluctuation taken to the burning regime. The steam generator was found to operate with good stability with both gaseous and liquid fuels. Composition of the fuel mixture can be well controlled by monitoring the temperature of the exhausted steam. 7 refs., 11 figs.

35606 (AOSTRA–8808, pp. 11) **Use of slant drilling techniques for exploitation of Venezuela's shallow reservoir.** Marott, A. (Petroleos de Venezuela); Pina, R. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy*

crude and tar sands, vol. 2. Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

Shallow heavy oil reservoirs in the Maracaibo and Orinoco regions of Venezuela have been exploited by the use of slant drilling. This technique has enabled recovery of heavy oil trapped beneath residential and agricultural areas, and has reduced the related drilling time and costs to the same level as for conventional vertical wells. Description of the drilling techniques and equipment includes details of the slant rig used. The rig includes a derrick inclinable to 45 degrees and hydraulic pipe handling and torquing systems. The slant rig was found to be more suitable than conventional vertical rigs for directional drilling in modules of up to 8 wells each, depending on pattern. 5 refs., 7 figs.

35607 (AOSTRA–8808, pp. 11) **Design and evaluation of pilot tests of steam soak with additives in Venezuela heavy oil reservoirs.** Ziritt, J.L. (PDVSA, Caracas, Venezuela); Rivas, O.; Bresolin, G. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

Laboratory and field tests results are presented of steam soak with surfactant additives. Sixteen wells in the Bolivar Coast of Lake Maracaibo were steam-foamed using two commercial surfactants under different operating conditions. For the pilot test, wells were selected which covered different characteristics and stages of drainage in the Bolivar Coast. Parameters such as injection pressure surfactant concentration, presence of an electrolyte and a non-condensable gas and steam quality were changed during the test. Flowmeters were run with each set of conditions and results were evaluated by a mathematical procedure which gives the Steam Diversion Factor. Additionally, the actual production performance was compared with the predicted producton for a conventional cycle. Even though the production cycle of the steam-foamed wells has not been completed, results at present show an average incremental oil production of 24%. 7 refs., 10 figs., 2 tabs.

35608 (AOSTRA–8808, pp. 15) **Steam-CO_2 injection to recover heavy oil in limestones.** Guemrah, F. (Middle East Technical Univ., Ankara, Turkey); Okandan, E. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

Research on combined use of steam and CO_2 was conducted on laboratory models of limestone saturated with heavy oil and water. Results obtained from the three dimensional laboratory model are presented. The Turkish crude oils used, Bati Raman with 12.5 API (American Petroleum Institute) and Camurlu with 11.1 API gravities had viscosities of 41 and 64 pascal-seconds at 20^0 C, respectively. The porous medium, composed of crushed limestone has 40% porosity, 29 darcy permeability as determined from linear models. Experiments were conducted at 75% oil and 25% water saturations. Cumulative oil recovery was 5.5-10% higher when CO_2 was injected simultaneously with steam compared to the steam only case. When comparison is made with recoveries obtained from linear models, the three dimensional flow effect caused about 60% decrease in the recovery. The amount of condensate collected from the second separator in the production line showed an increase when CO_2 was present together with steam. The densities of the light ends collected were lower than that obtained in steam injection, which indicated the better distillation effect of CO_2-steam on the in-situ oil. The steam front movement which is affected by the flow pattern indicated successive production peaks could be obtained, which is an indication of multiple contact between in-situ oil and injected steam-CO_2 mixture. The producton history as well as the change in the condensate densities showed this effect. 26 refs., 14 figs., 2 tabs.

35609 (AOSTRA–8808, pp. 27) **Ultrashort radius radial system. A new drilling and completion method for rapid development of oil sands reservoirs.** Dickinson, W. (Petrolphysics, Inc., San Francisco, CA, USA). Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

The technology, equipment, and field application of the ultrashort radius radial system for directional drilling is described. The system is capable of drilling and extended completion of stratified reservoirs for rapid and low-cost development by means of multiple radials. Most types of rock can be rapidly drilled at depth with the medium pressure water jet drills used with this system. Ultrashort radius whipstocks enable a 90 degree turn to be made in a 9-12 inch radius in both vertical and deviated wells. Closed loop control of the drill trajectory provides control while drilling in pitch, independent of roll; horizontal penetration rate is regulated by an independent hydraulic motion controller. Horizontal gravel packing, flexible slotted lining and electrochemical perforations have also been developed. Applications of multiple radials include steam injection, gravity drainage, multiple layers of production, and water coning control. Results are presented from field installations in California and show increases in productivity with lower operating costs. 9 refs., 22 figs.

35610 (AOSTRA–8808, pp. 8) **Rospo Mare, offshore Italy. An industrial development based on horizontal wells. Technical and economical aspects.** Bosio, J.C. (Elf Aquitaine, Paris, France). Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). Rospo Mare is an offshore oil field in 90m of water, with over 700 million barrels of oil in place. The pay zone is a tight and karstic calcareous formation, heavily fractured, with an active aquifer. Experience with vertical or tilted wells in this formation has indicated that they have low productivity and are quickly water-invaded by coning. A first horizontal well, drilled in 1982, had a productivity index over twenty times better than a vertical nearby well, and remained waterfree under a critical rate of 4000 bbl/d. Despite the low present price of heavy oil, production immediately became and remains today economical. A new platform has been installed and 5 new horizontal wells successfully drilled and put into production in 1987. Drilling, completion and production problems are described. An evolution of the costs is also presented, together with the recently decided plans for a new phase of development. Rospo Mare is the first industrial development of an offshore field based on horizontal wells only, and its results are encouraging for the future of this technique. 5 refs., 3 figs.

Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

A systematic investigation of cases for which the use of horizontal wells can improve the performance of thermal recovery by steam drive is presented. The cases studied by numerical simulation cover a wide range of fluid and formation characteristics, different spatial distributions for vertical and horizontal wells, as well as different injection strategies. The results are described in terms of oil production and costs; they are compared with the performances obtained by conventional development with vertical wells. It is shown that

horizontal well patterns are mainly attractive for thin, viscous-oil reservoirs, with low initial mobility, where steam drive, using vertical wells only, would be economically unprofitable or marginal. Moreover, well configurations combining vertical injectors and horizontal producers have specific advantages since they provide an accurate vertical description of the reservoir while taking benefit of horizontal production. Appropriate procedures of steam/drive application with horizontal wells in multi-layered formations are also shown to improve production performance. 13 refs., 11 figs., 5 tabs.

35612 (AOSTRA–8808, pp. 12) **Performance of first and second pilot cyclic steam stimulation projects in Kuwait.** Al Rabah, A.K. (Kuwait Oil Co.). Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02589). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sand, vol. 1.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

The heavy oil sand reservoir of Kuwait occurs at a shallow depth and contains a viscous and low American Petroleum Institute oil (ranges 11-15). Its reservoir temperature and pressure are generally low because of the shallow depth involved. The heavy oil reservoir has not yet been put into production by the primary recovery mechanism. To obtain an early answer on the suitability of a thermal process, two pilot projects for cyclic steam stimulation, each consisting of four wells, were initiated. The first cycle of the first pilot steam stimulation was started in September 1982 and concluded in March 1983. The first cycle of the second pilot project was started in June 1986 and concluded in August 1986. All eight wells are currently in production. Four wells showed natural flow exceeding five years with an average oil-steam ratio of 9.7. It is intended that two more steam injection cycles will be run at both pilots. In view of the favorable results obtained so far, steam soak projects have been expanded considerably since the start of the project. 21 additional wells in each pilot area have been drilled with a well spacing of 6 acres. These wells will be cyclic steam stimulated. 11 figs., 1 tab.

35613 (AOSTRA–8808, pp. 14) **The effects of well completion, steam injection and production practices on heavy oil production performance.** Ramsaran, A. (Trinidad and Tobago Oil Co. Ltd., (TRINTOC), Pointe-A-Pierre, Trinidad, West Indies). Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02589). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sand, vol. 1.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

In July 1981, in Trinidad, a pilot steam injection project, the Parrylands Pilot Steam Project, was specifically designed and commissioned to determine the effects of well completion, steam injection, and production practices on production performance. Well completion designs were varied for production casing sizes, perforation densities, liner types and sizes, underreamed hole size, and the use of thermal packers, to determine an optimal well design for use in future expansions to exploit the heavy oil in place, which is estimated to be 80 x 10^6 m^3. The project consists of 18 wells drilled on a 1.0 hectare spacing. From the beginning of the project, 4 complete cycles of steam injection/production data are available for evaluation. The cumulative production from the project is 108 x 10^3 m^3, with an estimated ultimate oil recovery of 350 x 10^3 m^3. The current average production rate is 70 m^3/d. Under optimum operating conditions, production rates have fluctuated to within +/- 15% of the performance predicted with the Boberg and Lantz model for cyclic steam stimulation. Optimal well designs for injectors and offtakes have been used in two phases of expansion comprising 30 additional wells. Injectors are now routinely completed as cased hole gravel pack completions and the offtakes are completed as either open hole or cased hole gravel packs after log evaluation. The experience gained in the control of the steam injection parameters and production practices has resulted in a lower project operating cost and an increase of about 16 m/sup3//d for the project. 6 refs., 8 figs., 5 tabs.

35614 (AOSTRA–8808, pp. 14) **Estreito field study of reservoir for the extension of steam cyclic injection pilot projects.** Ribelo de Azambuja, A. (Petrobas, Rio De Janeiro, Brazil); de B. Regina, M.M.A. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02589). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sand, vol. 1.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

The Estreito oil field is located at the border of the high block of the Carnaubais Fault, at the center of the Potiguar Basin, Brazil. The reservoirs belong to the medium Acu Formation and contain an estimated 54.5 million cubic meters (342.8 million bbl) of heavy oil (14 API) originally in place. This paper presents a summary of the rock and fluid properties. The production history, results of the steam pilot project, and the expansion of steam injection activities are discussed. The description of the simulators used are presented together with the problems that were encountered during the simulation. Finally, forecasted oil and water production data, and surveillance well data, are presented. 13 figs., 5 tabs.

35615 (AOSTRA–8808, pp. 10) **The Jobo Steamflood Project: A preliminary evaluation of results.** McGee, J. (Petroleos de Venezuela, Venezuela); Yibirin, J. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02589). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sand, vol. 1.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

This paper presents a description and a preliminary evaluation of results of the Jobo Steamflood Project, from start-up in March 1981 through December 1987. Despite the adverse presence of a strong natural water drive in this reservoir, which prevents pressure depletion by primary steam stimulated production, 41.5% of the original oil in place has been recovered, from an estimated final recovery of 45%. Steam breakthrough is expected to occur during 1989. Both optimum production and injection well completions, including insulating techniques, have been determined. Monitoring of the steam front has been very effective with the use of a combination of logs and radioactive tracers. Experience gained in the areas of production and injection well completion, as well as in surface facilities, will result in a more efficient development of conventional reservoirs and of the Orinoco Non-conventional, Heavy Oil Belt Field. The Jobo Field was selected because of the existing infrastructure and because rock and fluid properties are essentially identical to those prevailing in the Orinoco Belt. 6 refs., 6 figs., 2 tabs.

35616 (AOSTRA–8808, pp. 13) **Steam stimulation experience in Lake Maracaibo.** Romero, O. (LAGOVEN, S.A., Edo, Zubia, Venezuela); Arias, J. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02589). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sand, vol. 1.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

More than 50% of western Venezuela's remaining oil reserves are located in reservoirs found along the eastern coast of Lake Maracaibo. Most of these reserves are heavy oil with American Petroleum Institute gravities ranging from 11 to 20 degrees (0.993 to 0.934 specific gravity). The pay zones are at moderate depths, from 610m to 1,524m. Since 1965, wells in the major heavy oil reservoirs have been steam stimulated, resulting in considerable production increases and oil-steam ratios averaging 3.0 m^3/m^3. Since these reservoirs are located beneath Lake Maracaibo, steam is injected from barge-mounted generators with the capacity to inject two side-by-side wells simultaneously at an average pressure of 1,350 psi with 80% quality steam. Some unique features are associated with steam injection in Lake Maracaibo. Wells are thermally isolated in

situ with sodium silicate foam and are gas lifted during the production cycle. Since steaming began, modifications and innovations have been made to the original procedures in order to increase efficiency, reduce costs, and solve some problems. This paper reviews the steam stimulation experience in Lake Maracaibo and outlines the results to date and future plans. 10 refs., 13 figs., 1 tab.

35617 (AOSTRA–8808, pp. 8) **Feasibility of steam injection at 8200 feet.** Chacin, E. (S.A. MARAVEN, Langunillas, Zuila State, Venezuela, SA); Gomez, I.; Urdaneta, O.; Colonomos, P. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02589). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sand, vol. 1.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

During 1986 and 1987, a pilot cyclic steam tnjection test was carried out at Boscan Field in Venezuela. This project became a technical challenge for the industry because, for the first time, attempts were made to inject steam at depths exceeding 8000 ft. The objectives of the test were to determine the feasibility of injecting high quality steam at a depth of 8200 ft, and to analyze the response of the reservoir to steam stimulation. In order to obtain high quality steam at the bottom of these wells, it was necessary to inject steam through a pre-insulated tubing that assured a minimum (5%) heat loss throughout the 8200 ft. and, at the same time, could maintain tensile stress requirements. The pilot test was carried out in two wells of the Boscan Field. The production increase obtained on both wells was 38%. The reason for this low increase has not yet been determined, but there is an indication of the presence of severe damage on the formation, due to the effect of asphaltenes, coke deposits, or emulsions. The injection of steam, however, was a successful operation, which gave useful experience for the future of Boscan Field as well as for other similar reservoirs in Venezuela and other countries that produce extra heavy crude oil from deep reservoirs. 4 figs., 1 tab.

35618 (CHOA–8704) **Optimizing heavy oil production through innovative techniques. Proceedings [of the] fourth quarterly meeting of the Canadian Heavy Oil Association.** Canadian Heavy Oil Association (Canada). 1987. vp. (CONF-8704381–: 4. quarterly meeting of the Canadian Heavy Oil Association, Calgary, Canada, 28 Apr 1987;CE–02641). Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $N/C.

In a meeting which presented papers on techniques and equipment used in heavy oil production, the topics included sucker rod string accessories, abrasive slotting of well casings, composite media prepacks for sand control, and a new type of travelling valve for rod pumps. Separate abstracts have been prepared for four papers from this meeting.

35619 (CHOA–8704 VP) **Abrasive slotting of casing for use in heavy oil well completions and workovers.** Kelly, J. (Halliburton Services Ltd., Calgary, AB, Canada). Canadian Heavy Oil Association (Canada). 1987. (CONF-8704381–: 4. quarterly meeting of the Canadian Heavy Oil Association, Calgary, Canada, 28 Apr 1987;CE–02641). In *Optimizing heavy oil production through innovative techniques. Proceedings [of the] fourth quarterly meeting of the Canadian Heavy Oil Association.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $N/C.

Pumping an abrasive medium carried in a formation-compatible fluid, under high pressure (abrasive jetting), in order to perforate and/or simulate heavy oil wells offers many advantages compared to conventional techniques. The basic tool design consists of two tungsten carbide jets spaced 180 degrees apart, and in operation, nitrogen is added to the jetting fluid to reduce hydrostatic back pressure and enhance the cutting action. Areas of application include casing perforation, fracture initiation, well cleanout, sand control, pipe recovery, and stimulation. A set of criteria for the work string, treating fluid, casing and wellhead, nozzle size, return tank and transfer pump, and other factors are outlined for performing an abrasive jet operation. Some performance data are presented for a project carried out in Alberta. 4 refs., 5 figs., 3 tabs.

35620 (CHOA–8704, pp. 4) **New solutions to oil problems in pumping heavy oil.** Adair, J. (Harbison-Fischer Canada, Ltd., Calgary, AB, Canada). Canadian Heavy Oil Association (Canada). 1987. (CONF-8704381–: 4. quarterly meeting of the Canadian Heavy Oil Association, Calgary, Canada, 28 Apr 1987;CE–02641). In *Optimizing heavy oil production through innovative techniques. Proceedings [of the] fourth quarterly meeting of the Canadian Heavy Oil Association.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $N/C.

Problems in heavy oil pumping include gas lock, steam flashing, solids carried in the viscous fluids, fluid pound, and plunger fall (also known as rod fall). To address these associated problems, a mechanically-actuated travelling valve has been introduced to eliminate gas lock and minimize fluid pound and fluid drag on the travelling assembly. The new device, called the No-Loc Plunger, was primarily designed for operations in low-fluid-level wells and wells producing with a high gas-to-oil ratio. The design of the valve is based on opening the traveling valve on the downstroke, thereby transferring the entire fluid load to the standing valve. Flow capacity is increased due to the valve design having the drop placed outside of any flow-restricting cape or shell. The shape of the drop is such as to minimize drag, and the seat, being integrated into the plunger sleeve, permits the largest possible internal dimensions that can be achieved. The No-Loc is available for all sizes of rod insert and tubing pumps.

35621 (CHOA–8704, pp. 15) **Composite media prepacks for sand control in heavy oil production.** Scott, L. (Sherritt Gordon Mines, Ltd.); Parker, P. Canadian Heavy Oil Association (Canada). 1987. (CONF-8704381–: 4. quarterly meeting of the Canadian Heavy Oil Association, Calgary, Canada, 28 Apr 1987;CE–02641). In *Optimizing heavy oil production through innovative techniques. Proceedings [of the] fourth quarterly meeting of the Canadian Heavy Oil Association.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $N/C.

In a field test study in the Cold Lake area, four different filter media materials in new modular prepacks were evaluated as means of sand control in heavy oil production. After removal from the well and evaluation of the filter modules and the filter materials, it was concluded that one material, a chromium clad steel medium (cr-Fe shot), was particularly well suited for this application. This filter material withstood the main downhole environment and maintained good permeability through production and steam injection cycles during testing. In combination with the wire wrapped screen container module, this medium constitutes an improved form of sand control for the heavy oil industry. The modular prepack allows flexibility of design in terms of annular pack thickness, media size range and wire wrap spacing; the modular design allows installation ease, accuracy of sand control placement in the bore hole and recovery of the filter segments. 6 figs., 3 tabs.

35622 (CHOA–8704, pp. 41) **Optimize profits with Diversified Drilling Services Ltd.** Canadian Heavy Oil Association (Canada). 1987. (CONF-8704381–: 4. quarterly meeting of the Canadian Heavy Oil Association, Calgary, Canada, 28 Apr 1987;CE–02641). In *Optimizing heavy oil production through innovative techniques. Proceedings [of the] fourth quarterly meeting of the Canadian Heavy Oil Association.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $N/C.

The problems caused by tubing, rod, and rod coupler wear and failures have been addressed by development of a series of anti-friction coupling products described in this paper. Characteristics, performance, and costs of three products are given: a wheeled sucker rod centralizer, in which the wheels are so arranged that no metal contact is possible whatever direction the rod couplings are oriented; a sucker rod stabilizer designed for wells using rotating rod strings and screw pumps; and a coated sucker rod centralizer to be used in conjunction with the second device. Case studies are used to illustrate the benefits of the use of this type of equipment, notably in deviated holes, direction wells, slant wells and high sand

content reservoirs. These studies show advantages including reduction of rod loads and rod hangups, elimination of rod and tubing wear, and significant increases in production. 34 figs., 4 tabs.

35623 (CHOA–8808, pp. 16) **Reducing wellbore heat loss.** Meldau, R.F. (Dolphin Petroleum Consultants, Canada). Canadian Heavy Oil Association (Canada). 1988. (CONF-8808237–: Thermal well completions seminar, Edmonton, Canada, 11 Aug 1988;CE–02660). In *Thermal well completions seminar.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $N/C.

Even small reductions in heat lost from steam injection wells can save thousands of dollars every day, because generating steam is the most expensive part of thermal oil recovery. Some aspects of the complex flow of steam vapor and condensate in injection wells are not generally understood, though this greatly affects heat transfer to the casing wall. Properly designed and installed insulated tubing is expensive, but can dramatically reduce heat loss in steamflood injectors and deep cyclic steam wells. The industry needs a practical technique to measure wellbore heat loss, and thus better decide when to upgrade the completion, calibrate computer prediction models, and learn how insulated tubing is performing with time. Five different methods of measurement, three of which are field tested, are presented. Downhole steam generators eliminate wellbore and steam generator heat loss, but the risk of expensive workovers or well loss seems high; their field use to date is therefore limited. 26 refs., 15 figs., 2 tabs.

35624 (CHOA–8808, pp. 27) **Analysis of thermal well pumping performance at the Norcen-Bodo steam pilot.** Wong, A. (Alberta Oil Sands Technology and Research Authority, AB, Canada); Frankiw, K.E. Canadian Heavy Oil Association (Canada). 1988. (CONF-8808237–: Thermal well completions seminar, Edmonton, Canada, 11 Aug 1988;CE–02660). In *Thermal well completions seminar.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $N/C.

The Bodo Steam Project is operated by various partners, including Norcen Energy Resources and the Alberta Oil Sands Technology and Research Authority (AOSTRA). This paper presents a study conducted by Norcen and AOSTRA engineers to diagnose the interference steam and non-condensable gases rod-insert bottomhole pumps, and to develop solutions to in improve pump efficiency and well draw-down. The paper describes the bottomhole pump, the model for predicting pump efficiency in the presence of vapors, and the effect of lowering pump landing depths, of applying a fixed casing head pressure, and of injecting water. Dynamometer cards were used to study pump stroking conditions. An equation of state model (Peng-Robinson) is successfully applied to predict the vapor interference effect on pump performance, and a set of charts is presented to allow the operations personnel to apply the pump efficiency prediction model. 4 refs., 16 figs., 3 tabs.

35625 (CHOA–8808, pp. 16) **Thermal completions for radial production systems.** Dickinson, W. (Petrolphysics, Inc., Canada); Wilkes, R. Canadian Heavy Oil Association (Canada). 1988. (CONF-8808237–: Thermal well completions seminar, Edmonton, Canada, 11 Aug 1988;CE–02660). In *Thermal well completions seminar.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $N/C.

Most thermal wells involve unconsolidated formations, high viscosity crude oil, and low reservoir pressure. Radial wells improve access for steam into the formation and facilitate oil movement to the vertical well bore. However, the completion of horizontal or radial wells can be more costly and complicated than the drilling process itself. The Ultrashort Radius Radial System (URR) was developed to reduce the cost of horizontal drilling and to permit gravity feed into a vertical sump and pump. The system is really an extended completion system or set of long piped perforations. Multiple radials on multiple levels may also be provided. Three thermal completion options have been developed for the URR: horizontal gravel packing, which uses two separate lifts of gravel to produce 100% fill; flexible perforators, which provide about 120 simultaneous perforations in 1/2 h; and flexible slotted liners, which can be placed around the ultrashort radius. All three thermal completion options may be applied separately or in combination. Initial field results indicate that wells having horizontal radials exhibit higher production rates, longer time between workovers, and better efficiency of steam utilization. 14 refs., 8 figs.

35626 (CHOA–8808, pp. 10) **Gravel pack equipment requires special design for thermal recovery.** Weirich, J.B. (Baker Sand Control U.S.A.); Zaleski, T.E. Canadian Heavy Oil Association (Canada). 1988. (CONF-8808237–: Thermal well completions seminar, Edmonton, Canada, 11 Aug 1988;CE–02660). In *Thermal well completions seminar.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $N/C.

Successful gravel packed completions in thermal recovery wells depend upon proper design and selection of downhole equipment. Gravel pack equipment designed for normal geothermal environments will generally lack the strength necessary to maintain satisfactory performance in a thermal well completion. Since the equipment would not be subjected to large temperature changes, thermal generated forces do not need to be considered or accommodated in standard applications. This paper discusses design criteria for the selection of gravel pack equipment for thermal recovery wells. The theoretical approach to the problems is supplemented with both experimental and field results. 9 refs., 5 figs.

35627 (CHOA–8808, pp. 10) **Investigation of a premium casing connection for Canadian thermal recovery wells.** Slack, M.W. (Centre for Frontier Engineering Research, Canada); Kaiser, T.; Beaulac, G. Canadian Heavy Oil Association (Canada). 1988. (CONF-8808237–: Thermal well completions seminar, Edmonton, Canada, 11 Aug 1988;CE–02660). In *Thermal well completions seminar.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $N/C.

A test procedure to evaluate casing connections for Canadian thermal recovery wells is derived from current design assumptions and applied to candidate specimens. Seal surface contact pressures are presented as assessed numerically by finite element analysis and experimentally by direct measurement using a recently developed technique. The importance of considering both temperature and time dependence of material mechanical properties is demonstrated. The test procedure described is designed to evaluate both mechanical strength and seal integrity under realistic combinations of load and temperature. 8 figs., 1 tab.

35628 (CHOA–8808, pp. 37) **Sand control with geotextile filters.** Scott, J.D. (Univ. of Alberta, Edmonton, AB, Canada); Kerr, N.; Richards, E.A.; Martin-Scott, S.Y. Canadian Heavy Oil Association (Canada). 1988. (CONF-8808237–: Thermal well completions seminar, Edmonton, Canada, 11 Aug 1988;CE–02660). In *Thermal well completions seminar.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $N/C.

Sand flow is a major problem in many production wells founded in heavy oil and oil sands unconsolidated sand formations. Well filters such as slotted liners, screens, and gravel packs often have plugging and erosion problems in the harsh environments that occur in thermally stimulated projects in this type of reservoir. The objective of this paper is to discuss how a longer lasting and more efficient filter can be designed by applying the technology recently developed in two fields: geotechnical engineering and polymer science. Recently, woven and nonwoven geotextiles have been developed as filters for underground drainage systems and water wells. These innovations, combined with high technology textiles, can be applied to filtration for oil wells and offer a potential improvement over current filter systems. In thermally stimulated wells, a filter must withstand high temperatures and highly alkaline conditions, while maximizing oil fluid flow and minimizing sand production. Geosynthetic filters possess many advantages over conventional filters: large surface area, high porosity and permeability, a pore size distribution tailored for the formation sand, and, in geocomposites, both good filtration and in-plane flow properties. 65 refs., 26 figs., 4 tabs.

35629 (CU/FCE–8903, pp. 24) **The role of combustion gases in recovering oil in in-situ combustion processes.** Erno, B.P. (Nova Husky Research Corp., Calgary, AB, Canada). Calgary Univ.,

AB (Canada). Faculty of Continuing Education. 1989. (CONF-8903126–: 6. annual heavy oil and oil sands technical symposium, Calgary, Canada, 8 Mar 1989;CE–02591). In *Challenges and innovations 1989. 6th Annual heavy oil and oil sands technical sypmposium.* Available from CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $3.40 CAN minimum, plus $0.25/p after 10 pages.

Due to its applicability in reservoirs not suitable for other enhanced oil recovery (EOR) applications, in-situ combustion is considered to be one of the most widely applicable EOR techniques. This work attempts to quantify the role of combusiton gas mixtures in oil recovery by in-situ combustion. A series of core flood tests were performed using combustion gases simulating both air and oxygen fire floods in the presence of reservoir oil and sand. Core flood experiments were conducted to study the effect of temperature ranging from 50 to 200^{0}C. Gas injection was carried out at different flow rates in order to simulate different flow regimes. The results indicate that recovery efficiency depends largely on the flow regime prevailing, indicating the importance of flow rate controlled fire flood schemes. Changing the gas composition from rich in nitrogen (as produced from air combustion) to rich in carbon dioxide (oxygen combustion) had some impact on oil recovery. Another series of runs was conducted to investigate the impact of hot water injection following an initial gas flood. In the cases studied, the injection of hot water following a gas flood gave much higher recovery than waterflood alone, showing the superiority of the sequential flow of gas and water as opposed to dry gas drive or hot water drive ahead of the fire front. 10 refs., 9 figs., 5 tabs.

35630 (CU/FCE–8903, pp. 17) **Cold Lake artificial lift optimization.** Elgert, B.D. (Esso Resources Canada, Ltd.); Chambers, N.A.; Suzuki, F. Calgary Univ., AB (Canada). Faculty of Continuing Education. 1989. (CONF-8903126–: 6. annual heavy oil and oil sands technical symposium, Calgary, Canada, 8 Mar 1989;CE–02591). In *Challenges and innovations 1989. 6th Annual heavy oil and oil sands technical symposium.* Available from CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $3.40 CAN minimum, plus $0.25/p after 10 pages.

Short downhole pump runlife in Esso's Cold Lake operation results in high pump repair and well servicing costs and lost or deferred production. The primary causes of pump failure were identified as sand related failures occurring shortly after the flowback stage and scale related failures occuring throughout all production stages. Two methods of improving pump runlife in Cold Lake were identified and implemented, based on these primary causes of pump failure. The first method involves controlling flowrates during the high energy, flowback stage using choke operating guidelines. This method focuses on reducing the rate of sand production into the wellbore during the flowback stage. The second method involves the use of chrome plated barrels and spray metal plungers, in place of carbon steel barrels and chrome plated plungers, in Cold Lake rod insert pumps. This method focuses on the improved scale resistance of chrome plated surfaces to Cold Lake produced fluids. Although both methods use existing, low cost production technology, early results suggest that these methods will result in a significant improvement of pump runlife in Cold Lake. 11 figs., 1 tab.

35631 (CU/FCE–8903, pp. 15) **Horizontal well application in the Pelican Lake and winter reservoirs.** Coffin, P. (CS Resources Ltd.). Calgary Univ., AB (Canada). Faculty of Continuing Education. 1989. (CONF-8903126–: 6. annual heavy oil and oil sands technical symposium, Calgary, Canada, 8 Mar 1989;CE–02591). In *Challenges and innovations 1989. 6th Annual heavy oil and oil sands technical symposium.* Available from CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $3.40 CAN minimum, plus $0.25/p after 10 pages.

This paper briefly reviews the history of horizontal wells and their different applications. The two heavy oil horizontal well projects undertaken in Canada by CS Resources Ltd. in 1988 are presented. Ten horizontal wells were drilled, totalling a horizontal drilling meterage over 5,000 metres, and produced. Both cost and early production results are very encouraging. 6 refs., 6 figs., 2 tabs.

35632 (DOE/BC/14204–2) **Cyclic CO_2 injection for light oil recovery: Performance of a cost shared field test in Louisiana: Second quarterly report, 21 February–21 May 1989.** Monger, T.G. Louisiana State Univ., Baton Rouge, LA (USA). Dept. of Petroleum Engineering. 1989. 7p. Sponsored by DOE Energy Research. DOE Contract FG22-89BC14204. Order Number DE89014217/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The ultimate objective of this research is to provide a base of knowledge on the CO_2 process for the enhanced recovery of Louisiana crude oil. First year goals of the project include laboratory corefloods to investigate several parameters important to the process, and numerical simulation to interpret coreflood results. Additional activities include construction of a field test data base, and development of a radial core setup. Second and third year goals include evaluation of field tests performed by the private sector, in conjunction with implementation of Department of Energy sponsored field tests. The results of all laboratory and field evaluations will be made available to the industry through one or more workshops. Results are briefly reported.

35633 (DOE/FE–0135) **Enhanced oil recovery program plan: FY 1989.** Department of Energy, Washington, DC (USA). Assistant Secretary for Fossil Energy. Jun 1989. 40p. Sponsored by DOE Fossil Energy. Order Number DE89013909/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

These reports provide solid evidence of the need for an aggressive R&D program to increase the recovery of domestic oil. They also highlight the need to integrate the development of advanced technologies with private sector initiatives and to obtain an industry perspective on future research needs. This document is structured so that the two major components of the program, reservoir characterization research and advanced EOR technology development are described individually; but they are indivisible parts of the program that complement each other. Specific objectives are presented. 11 refs., 9 figs., 1 tab.

35634 **Influence of natural fractures on hydraulic fracture propagation.** Teufel, L.W.; Warpinski, N.R. vp.American Association of Petroleum Geologists, Tulsa, OK (1988). (CONF-880301–: Annual meeting of the American Association of Petroleum Geologists, Houston, TX, USA, 20-23 Mar 1988).

Hydraulic fracturing has become a valuable technique for the stimulation of oil, gas, and geothermal reservoirs in a variety of reservoir rocks. In many applications, only short fractures are needed for economic production. In low-permeability reservoirs, however, long penetrating fractures are generally needed, and in this case, natural fractures can be the cause of many adverse effects during a fracture treatment. Natural fractures can influence the overall geometry and effectiveness of the hydraulic fracture by: (1) arresting the vertical or lateral growth, (2) reducing total fracture length via fluid leakoff, (3) limiting proppant transport and placement, and (4) enhancing the creation of multiple or secondary fractures rather than a single planar hydraulic fracture. The result may range from negligible to catastrophic depending on the values of the ancillary treatment and reservoir parameters, such as the treating pressure, in-situ stresses, pore pressure, orientations of the natural fractures relative to principle in-situ stresses, spacing and distribution of the natural fractures, permeability, etc. Field observations from mineback experiments at DOE's Nevada Test Site and the multiwell experiment in Colorado, laboratory tests, and analyses of these data are integrated to describe the complex fracture behavior found to an provide guidelines for predicting when this complex fracturing occurs.

Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

Among the various residue upgrading processes in use, conventional HDS units operated at elevated temperature are widely employed for cracking inferior crudes with a high metal content, such as Middle East or South American Crude. Such a high temperature operation results in inducing dry sludge formation in product oil and maximum conversion is regulated by that limitation. In the VisABC process–a combination of hydrovisbreaking and hydroconversion by ABC catalyst–the maximum conversion was improved by as much as 15% for inferior crudes. The advantage of the higher conversion in the VisABC process is demonstrated by characterizing the reaction mechanism in the process. A reaction mechanism model and compatibility prediction modes were developed for the prediction of the maximum conversion in this process. Results indicate the process to be an excellent tool, if calibrated further, to optimize various types of residual hydroconversion processes. 5 refs., 13 figs.

35636 (AOSTRA–8808, pp. 21) **ASVAHL new routes for prosessing heavy oils.** Peries, J.P. (Inst. Francais du Petrole-CEDI, France); DesCourieres, T.; Renard, P.; Rossarie, J. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

Heavy crudes are characterized by their low atmospheric distillate content and their structure that is rich in polyaromatics, resins and asphaltenes. As a result, they raise problems of recovery from the field, transportation and refining. ASVAHL has investigated the desalting of heavy crudes. To solve the transportation problem, ASVAHL proposes to decrease the viscosity by various thermal processes (TERVAHL T visbreaking, TERVAHL H.-hydrovisbreaking and TERVAHLC catalytic hydrovisbreaking, and TERVAL C catalytic hydrovisbreaking). Two refining routes have been developed. An indirect one using the SOLVAHL heavy-solvent deasphalting process to prepare feedstocks for conventional conversion plants, and a direct one using the HYVAHL process for the catalytic hydrotreatment of residues. For the upgrading of heavy crudes, ASVAHL has made associations of different TERVAHL, SOLVAHL and HYVAHL processes and their variants in a processing scheme both on the field and in the refinery. Technical solutions for all problems, ranging from transportation alone to deep conversion, from the use of bitumen to transformation into the maximum amount of low-sulfur fuel oil, have been tested on a large scale. The principal characteristics of the products, distillates or residues are described and compared to standard specifications for cuts such as fuels or bitumens or to the characteristics required for conventional refining products that may be found downstream. The different schemes - SOLVAHL alone, TERVAHL HC alone, TERVAHL HC + SOLVAHL, TERVAHL H + HYVAL - are compared from the viewpoint of conversion to light products, and reduction of the amount of fuel oil, for a Canadian and a Venezuelan heavy crude. 6 figs., 10 tabs.

35637 (AOSTRA–8808, pp. 15) **Mild resid hydrocracking for heavy oil upgrading.** Sice, H. (Idemitsu Kosan Co. Ltd.); Sekino, M; Yoshimoto, M.; Armstrong, R.B.; Klein, B. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

An intermediate approach for heavy oil upgrading, employing hydrogen addition at moderate pressure with a low-cost catalyst, has been developed. The process, called mild resid hydrocracking (MRH), has been implemented in a 10 bbl/d pilot plant constructed in 1985, and is described in this report. Over 5000 hours of operation have confirmed the reliability and performance of MRH, and sufficient data on yield, hydrogen consumption, and catalyst performance has been produced to support ongoing economic studies to verify the attractiveness of the process for heavy oil upgrading. The principal advantages of MRH are low operating pressure (60-80 bars hydrogen partial pressure), inexpensive catalyst (spent fluid catalytic cracking catalysts can be used), high quality distillate product, and low hydrogen consumption. Feedstocks have included heavy Arabian vacuum resid and Canadian oil sands bitumen. 11 figs., 5 tabs.

35638 (AOSTRA–8808, pp. 9) **Upgrading of heavy crude at low-temperature and ambient-atmosphere.** Lee, A.S. (Univ. of Southern California, Los Angeles, CA, USA); Xu, X.W.; Yen, T.F. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

It has been found that the heavy fractions of crude oil, asphaltene and preasphaltene, can be converted into oil and resin fractions in an alkaline aqueous solution at low-temperature and ambient-atmosphere. A substantial reduction (up to 50 wt%) of heavy asphaltic fractions makes the heavy crude oil virtually free of asphaltene and metal, with a significant decrease of viscosity. The treated crude oil is upgraded to lower density with a high recovery (up to 99% based on carbon content). Lighter crude oil separates and collects as a layer on the surface of the aqueous solution, which is then recovered and recycled. This new method utilizes the acid-bearing functional group from the heavy asphaltic fractions which react with cations, such as sodium ions in the alkaline aqueous solution, to develop surfactants. With the application of ultrasonic energy, monolamellar vesicles are formed. These monolamellar vesicles work as catalysts in carrying free radicals, such as hydrogen atoms and hydrated electrons which are generated by the cavitation effects of ultra-sonication. These radicals activate hydrogenation in the surfactant vesicle and, in turn, upgrade the heavy crude oil. At the low-temperature (55^0C) and ambient atmosphere operating conditions of this process, the energy consumption is extremely low as compared to the refining technology in existence. 13 refs., 1 fig., 3 tabs.

35639 (AOSTRA–8808, pp. 6) **Angelov/Shibley process improves economics of processing heavy oil.** Angelov, G. (Bitech Energy Resources Ltd., Willowdale, ON, Canada); Shibley, P.W.M. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

Conversion of heavy oil to light sweet synthetic crude is technically feasible but not economically viable in today's market. By optimizing treatment processes and applying partial desulphurization, heavy oil can be moved to important utility fuel markets at acceptable prices. Process selection for such a scheme is important. Initial handling and treatment costs must be controlled while preparation for desulfurization must be simple and effective. The Angelov/Shibley process described in this paper satisfies these criteria by combining the functions of de-emulsification, de-watering, de-salting and pentane de-asphalting. The deasphalted oil from pentane de-asphalting is easily and economically desulfurized to satisfy the utility fuels market. This is potentially a large market which could stimulate significant development of heavy oil. The asphaltenes rejected by deasphalting can readily be disposed of as coal fines binder. 4 refs., 1 fig., 2 tabs.

35640 (DOE/EIA–M037) **Refinery yield model spreadsheet system (RYMSS) documentation.** USDOE Energy Information Administration, Washington, DC (USA). Office of Oil and Gas. Apr 1989. 51p. Sponsored by DOE Management & Administration. Order Number DE89012629/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This document provides a description of the model logic and database associated with Version 1 of the Refinery Yield Model Spreadsheet System (RYMSS). The database consists of data

tables which describe model input and yield data, including the definition of data elements, data sources, and units of measurement. This database documentation is expected to be useful for economists (or the equivalent professional skill level) who are interested in performing refinery analysis using RYMSS. In addition, this documentation can serve as a tutorial for potential operators of the model. This document is divided into five chapters. The first two chapters present an overview of the model and its structure. The following two chapters present the model inputs/control variables and yield data tables, respectively. The final chapter presents the data tables associated with product blending. 7 figs., 19 tabs.

35641 Low severity co-processing using homogeneous basic nitrogen promotors. Miller, R.L. (Chemical Engineering and Petroleum Refining Dept., Colorado School of Mines, Golden, CO (US)); Giacomelli, G.F.; Baldwin, R.M. *American Chemical Society, Division of Gas and Fuel Chemistry, Preprints (USA),* 33(1): 154-162 (Jun 1988). (CONF-8806136–: American Chemical Society Division of Fuel Chemistry meeting, Toronto, Canada, 5-10 Jun 1988).

In searching for effective coal dissolution promotors to be evaluated at low severity co-processing conditions, the authors concluded that, based on results from high severity studies, basic nitrogen compounds warranted extensive study. A previous study summarized data from several high severity liquefaction studies using 1,2,3,4-tetrahydroquinoline (THQ) in which THF coal conversions in the range of 85-100 wt% (MAF basis) were obtained with Wyodak subbituminous coal and Illinois 6 bituminous coal at reaction temperatures of 400^0-450^0C. However, distillate yields from these experiments were much lower than expected, and nitrogen material balance measurements indicated significant adduction of the THQ into non-distillable products. Thus, while basic nitrogen compounds appear attractive as coal dissolution promotors, the adduction problem limits their usefulness in high severity co-processing. The authors hypothesized that utilizing basic nitrogen compounds at lower severity would reduce adduction sharply, but that effectiveness towards promoting coal dissolution would remain high.

35642 (AD-A–205006/0/XAB) **Jet-fuel deoxygenation. Interim report, March 1987-July 1988.** Darrah, S. Geo-Centers, Inc., Newton Upper Falls, MA (USA). Oct 1988. 29p. (GC-TR–88-1416-013). Available from NTIS, PC A03/MF A01.

This program was initiated to identify and characterize methods of deoxygenating quantities of jet fuel to improve fuel thermal stability. Three methods - chemical getters, molecular sieves and nitrogen sparging - were evaluated. In the case of nitrogen sparging, additional results were obtained by comparing laboratory experimental results with the output from ULLAGE, a computer-based mathematical model. Each method was shown to reduce the oxygen content of jet fuel. Economic and system considerations favor nitrogen sparging for large quantities of fuel. Jet fuels, Deoxygenation. (mjm)

35643 (DOE/PC/88827–T2) **Thermal stability of jet fuel: Second quarterly report, January–March 1989.** Eser, Semih; Perison, J.; Copenhaver, R.M.; Schobert, H.H. Pennsylvania State Univ., University Park, PA (USA). Coll. of Earth and Mineral Sciences. 1989. 71p. Sponsored by DOE Fossil Energy. DOE Contract AC22-88PC88827. Order Number DE89013516/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

Six model compounds have been heat treated in nitrogen and air atmospheres at temperatures between 250 and 450°C for 1–4 hours. The treatments were carried out in microautoclave reactors according to the procedure outlined in the previous reports. The thermal treatments in air were carried out under 100 psig cold air pressure at 350 and 400°C. Some observations on the appearance of the reaction products are described. The reaction products from the thermal treatments in nitrogen have been analyzed by NMR and GC-MS. The results of these analyses are discussed. The NMR analysis of the reaction products from the treatments in air will be presented in the next report. 11 figs., 6 tabs.

35644 Reverse micelles in supercritical fluid chromatography. Smith, R.D. (Chemical Methods and Separations Group, Chemical Sciences Dept., Pacific Northwest Lab., Richland, WA (US)); Jones, H.K.; Wright, B.W.; Fulton, J.L. v.v of 1988 Pittsburgh conference and exposition on analytical chemistry and applied spectroscopy (abstracts). Pittsburgh Conference, Pittsburgh, PA (1988). (CONF-880204–: 39. Pittsburgh conference and exposition on analytical chemistry and applied spectroscopy, New Orleans, LA, USA, 22-26 Feb 1988).

Technical Paper NO. 628.

Reverse micelles and microemulsions in supercritical fluid solvents have recently been demonstrated and constitute potentially important new mobile phases for supercritical fluid chromatography (SFC). Reverse micelle mobile phases generally consist of a nonpolar continuous phase, an amphilphilic surfactant (such as AOT), and water, which occupies the core of the reverse micelle. Reverse micelles in supercritical fluids may be used to replace more polar mobile phases for normal-phase chromatography. Supercritical propane reverse micelle mobile phases have been investigated with silica columns and capillary columns and compared with liquid phases at ambient and elevated temperatures, and have been shown to greatly decrease retention for polar compounds. The decreased efficiency generally observed in liquid reverse micelle systems can be improved by operating at the higher supercritical temperature, where mass transport limitations are reduced. Use of a reverse micelle-supercritical fluid mobile phase further increases efficiency over reverse micelle liquid mobile phases due to the high fluid diffusivities. The separation of hydrophillic compounds, normally intractable by SFC, has been obtained. The general characteristics and phase behavior of supercritical fluid reverse micelle systems will be described. The potential applications and limitations of these mobile phases in SFC are also discussed.

China and Canada have great differences in petroleum fiscal systems. The effects of those fiscal systems and oil prices on the economics of heavy oil recovery projects are investigated. The paper also presents the economic evaluation results for a steam injection project taken from Karamay oilfield, China. Two economic indicators of supply oil price and marginal oil price are evaluated under both different petroleum fiscal systems. The heavy oil recovery projects are associated with high capital and operating costs. The economic characteristics of the different steam injection strategies are also studied. Finally, discussions have been made on the prospect of a heavy oil on-site upgrading project and the ways to improve the economics of a heavy oil recovery project. 4 refs., 8 figs., 7 tabs.

35646 (AOSTRA–8808, pp. 10) **Update: Refiners' and marketers' perspectives. What the crash of 1986 did to heavy crude economics and marketing.** Lundberg, T. (Energy Detente, North Hollywood, CA, USA). Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

The rise and fall of the light-heavy crude price differential is examined in light of refining and marketing developments that took place prior to, during, and after the world oil price crash of 1986. Rapid swings in supplies, prices, netbacks, and margins threw refining

economics into disarray. This seriously interfered with the planning process. Increased refined product trade, delayed heavy bottoms conversions investments, downstream joint ventures, and light products quality requirements robbed heavy crude and tar sands of developmental impetus. Environmental protection compliance stands as a potentially serious roadblock to use of heavy crude and non-conventional feedstocks. Political consequences of 1986 did their own damage to development prospects of heavy crude, by championing such longer-term goals as non-petroleum alternatives while all but ignoring the nearer-term feasibilities of heavy crude and tar sands. The shakeout among higher- vs lower-technology refineries with respect to heavy oil conversion has been interrupted, but if conventional crude supplies tighten and heavy crude economics improve, that shakeout will return with a vengeance. The first two oil price shocks in the 1970's provided incentives for heavier crudes and non-conventional petroleum. The third oil price shock in 1986 marked the contemporary market environment wherein the competitiveness of heavy crude and non-conventionals has faded. The disincentive to market and refine heavy crude was provided by lower crude oil prices and weak demand. Despite obvious benefits to consumers and the economy in general, this situation threatens the future ability of the energy industry to make a smooth transition to heavy and synthetic crudes dependency. 10 figs. 1 tab.

This document includes the presentations made at a conference, covering heavy oil supply and demand in Canada to 2000; traditional and non-traditional markets; the need for upgrading; and the role of the provincial and federal governments in the development of heavy oil. Separate abstracts have been prepared for six papers from this conference.

35648 (DOE/EIA–0035(89/03)) **Monthly energy review, March 1989.** USDOE Energy Information Administration, Washington, DC (USA). Office of Energy Markets and End Use. 26 Jun 1989. 149p. Sponsored by DOE Management & Administration. Order Number DE89014154/JAW. Available from NTIS, PC A08/MF A01 - GPO - OSTI; GPO Dep.

US refiners' cost of crude oil rose to $16.55 per barrel in the first quarter of 1989, up 7 percent from the cost in the first quarter of 1988. Some of the crude oil price increase was passed through to consumers of petroleum products. For example, the average price of finished motor gasoline (excluding taxes) increased 6 percent. US petroleum productions did not reflect the crude oil price increase. It declined by nearly 6 percent in the first quarter of 1989 compared with the first quarter of 1988 and contributed to a 0.4-percent decline in total energy production. US consumption of all forms of energy combined remained near 22 quadrillion Btu, about the same as 1 year earlier. At the same time, real gross national product (GNP) in the first quarter of 1989 was up 3.1 percent compared with GNP in the first quarter of 1988. The widening gap between US energy production and US energy net imports. Energy net imports totaled 3.5 quadrillion Btu in the first quarter of 1989, up 5 percent from the level in the first quarter of 1988. Petroleum, which accounts for most of the US energy trade in terms of quantity and value, registered an 11-percent increase in net imports.

35649 (DOE/EIA–0109(89/03)) **Petroleum supply monthly, March 1989.** USDOE Energy Information Administration, Washington, DC (USA). Office of Oil and Gas. 24 May 1989. 133p. Sponsored by DOE Management & Administration. Order Number DE89012962/JAW. Available from NTIS, PC A07/MF A01 - GPO - OSTI; GPO Dep.

The Petroleum Supply Monthly (PSM) is one of a family of three publications produced by the Petroleum Supply Division within the Energy Information Administration (EIA) reflecting different levels of data timeliness and completeness. Data presented in the PSM describe the supply and disposition of petroleum products in the United States and major US geographic regions. The data series describe production, imports and exports, inter-Petroleum Administration for Defense (PAD) District movements, and inventories by the primary suppliers of petroleum products in the United States (50 States and the District of Columbia). The reporting universe includes those petroleum sectors in "Primary Supply." Included are: petroleum refiners, motor gasoline blenders, operators of natural gas processing plants and fractionators, inter-PAD transporters, importers, and major inventory holders of petroleum products and crude oil. When aggregated, the data reported by these sectors approximately represent the consumption of petroleum products in the United States. Data presented in the PSM are divided into two sections (1) the Summary Statistics and (2) the Detailed Statistics.

The Petroleum Supply Monthly (PSM) is one of a family of three publications produced by the Petroleum Supply Division within the Energy Information Administration (EIA) reflecting different levels of data timeliness and completeness. The other two publications are the Weekly Petroleum Status Report (WPSR) and the Petroleum Supply Annual (PSA). Data presented in the PSM describe the supply and disposition of petroleum products in the United States and major US geographic regions. The data series describe production, imports and exports, inter-Petroleum Administration for Defense (PAD) District movements, and inventories by the primary suppliers of petroleum products in the United States (50 States and the District of Columbia). The reporting universe includes those petroleum sectors in "Primary Supply." Included are: petroleum refiners, motor gasoline blenders, operators of natural gas processing plants and fractionators, inter-PAD transporters, importers, and major inventory holders of petroleum products and crude oil. When aggregated, the data reported by these sectors approximately represent the consumption of petroleum products in the United states.

35651 (DOE/EIA–0340(88)/1) **Petroleum supply annual 1988: Volume 1.** USDOE Energy Information Administration, Washington, DC (USA). Office of Oil and Gas. 18 May 1989. 148p. Sponsored by DOE Management & Administration. Order Number DE89014826/JAW. Available from NTIS, PC A08/MF A01 - GPO - OSTI; GPO Dep.

The Petroleum Supply Annual (PSA) contains information on the supply and disposition of crude oil and petroleum products. The publication reflects data that were collected from the petroleum industry during 1988 through annual and monthly surveys. The PSA is divided into two volumes. This first volume contains two sections, Petroleum Supply Summary and Refinery Capacity, each with final annual data. The second volume contains final statistics for each month of 1988, and replaces data previously published in the Petroleum Supply Monthly (PSM). The tables in Volumes 1 and 2 are similarly numbered to facilitate comparison between them. 40 tabs.

35652 (DOE/EIA–0517(89)) **Annual outlook for oil and gas 1989.** USDOE Energy Information Administration, Washington, DC (USA). Office of Oil and Gas. 1 Jun 1989. 97p. Sponsored by DOE Management & Administration. NONE. Order Number DE89013169/JAW. Available from NTIS, PC A06/MF A01 - GPO - OSTI; GPO Dep.

Since 1973, the US petroleum and natural gas industry has been affected by a number of dramatic events that have changed the way the oil and gas markets operate and, consequently, the long-term outlook for them. The Annual Outlook for Oil and Gas 1989 (AOOG89) discusses recent events affecting these markets and the likely impacts of these events on the future. Forecasts for petroleum and natural gas markets are presented in this report through the year for a base case and two alternative cases. These cases combine lower world oil prices with higher economic growth and higher world oil prices with lower growth. The base case assumption for world oil prices in the year 2000 is $28.00, in 1988 dollars. The two alternative world oil price cases assume world oil prices in the year 2000 that range from $21.70 to $35.00. In the base case, the

economic growth, measured by the Gross National Product, is assumed to grow at an annual rate of approximately 2.5 percent. With the low and high growth assumptions, the economy grows at annual rates of 2.2 and 2.8 percent, respectively. An additional case describes that impact of an alternative scenario that increases the natural gas import assumptions. 16 figs., 19 tabs.

35653 (DOE/EIA–0520(89/06)) **International petroleum statistics report.** USDOE Energy Information Administration, Washington, DC (USA). Office of Energy Markets and End Use. 26 Jun 1989. 36p. Sponsored by DOE Management & Administration. Order Number DE89014810/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The International Petroleum Statistics Report presents data on international oil production, consumption, imports, exports, and stocks. The report has three sections. Section 1 contains time series on world oil production, and on oil consumption and stocks in the Organization for Economic Cooperation and Development (OECD). This section contains annual data beginning in 1973, and monthly data for the most recent two years. Section 2 presents an oil supply/consumption balance for the market economies (i.e. non- communist countries). This balance is presented in quarterly intervals for the most recent two years. Section 3 presents data on oil imports by OECD countries. This section contains annual data beginning in 1982, and quarterly data for the most recent two years. 23 tabs.

35654 (DOE/RL/01830–H3) **Oil use and oil dependency: Long-term issues.** Serot, D.E.; Belzer, D.B.; Guthrie, S.A.; Roop, J.M. Pacific Northwest Lab., Richland, WA (USA). Jun 1989. 156p. Sponsored by DOE Management & Administration. DOE Contract AC06-76RL01830. Order Number DE89014614/JAW. Available from NTIS, PC A08/MF A01 - OSTI; GPO Dep.

The continued dependence of the United States on imported oil is a matter of increasing concern. Under the direction of the Department of Energy's Office of Policy Integration, Pacific Northwest Laboratory conducted a study which was to examine long-term issues related to oil dependence. Major issues addressed are (1) energy efficiency and the role of new technologies, (2) fuel switching, and (3) regional factors affecting fuel use. The study examines all major end-use sectors in the economy, covering the industrial, commercial, residential, transportation, and electric utility sectors. The potential impacts of efficiency improvements in oil- using equipment are assessed through the year 2000. 107 refs., 8 figs., 9 tabs.

35655 (MU–8708) **Final report of the Commission of Inquiry into Gasoline Pricing in the province of Manitoba, 1987.** Nicolaou, C.A. Manitoba Univ., Winnipeg, MB (Canada). 1987. 309p. (MICROLOG–89-00831). Available from Manitoba. Dept. of Consumer and Corporate Affairs, Legislative Bldg., Rm. 104, Winnipeg, MB, Canada R3C 0V8; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

A commission was established to investigate Manitoba retail gasoline prices and their responsiveness to crude oil costs, as well as upon matters pertaining to the regulatory powers of the province in relation to gasoline and related products. Data were obtained from a number of sources including surveys, literature reviews, and contacts with industry and government. This report presents the results of the commission's investigations and includes a description of the structure of the Canadian petroleum industry and the wholesale and retail gasoline markets. The main findings and recommendations are as follows. Gasoline prices in Winnipeg have not fully reflected reductions in crude oil costs in 1986. This situation is estimated to have cost the average motorist $35-50/y and these losses are just one example of the lack of effective competition. The need to improve the Manitoba market in terms of local market conditions is therefore indicated. Wholesale gasoline prices to large independent resellers have been fairly competitive for some time, but there is a need for these wholesale prices to be made available to smaller resellers and other users. To achieve this result, it is recommended that an agency be hired or created to buy gasoline from existing competitive sources and to resell it at a single competitive price to any reseller, farmer, or commercial/industrial user. To keep retail margins competitive, it is also recommended that the government set up a small number of Winnipeg gasoline stations and lease them to independent resellers willing to resell gasoline at a competitive retail margin. 50 figs., 20 tabs.

35656 (NEI-NO–85) **Cost effectiveness.** Norsk Petroleumsforening, Oslo. 1988. 127p. (CONF-8805291–: Offshore Northern Seas '88, Stavanger, Norway, 23-26 May 1988). Order Number DE89776211/JAW. Available from NTIS (US Sales Only), PC A06/MF A01.

This section of the proceedings contains seven papers covering the following topics: Cost consideration factors; Effect of regulations on cost; An integrated approach to cost consciousness; Project management and execution; How to make smaller fields viable; Developing cost effective technology for the future; Cost effective operation. Separate abstracts were prepared for two papers of the section.

0208 Waste Management

35657 (AL–86-ALL-07(A-80)) **Beaufort Sea ocean dumpsite characterization.** Arctic Labs. Ltd., Sidney, BC (Canada); LGL Ltd. Environmental Research Associates, King City, ON (Canada). 1987. 247p. (MICROLOG–88-06210). Available from Environment Canada, Library Services, Terrasses de la Chaudiere, 10 Wellington St., Ottawa, ON, Canada K1A 0H3; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The seabed at two potential Beaufort Sea sites for dumping solid wastes from the oil and gas industry was characterized in late August 1986 by side-scan sonar coverage, bathymetry, sub-bottom profiling, surficial sediment particle size, surficial sediment trace metal and hydrocarbon content, and infaunal benthic community species and density. Sampling was conducted during a one week cruise aboard a research ship. In addition, within each dumpsite, trawls were jarried jout to qualitatively sample for epibenthos and bottom fish. At each location, two grab samples were taken with a Smith-McIntyre grab (0.1 m^2 surface area bite). One was sieved for macrobenthos, the second sub-sampled for trace metals, hydrocarbon, and particle size analyses. 30 locations were sampled in and around each dumpsite. Sample locations were chosen randomly; 10 sites were within 1.5 km radius of the dumpsite center; 20 sites between 1.5 and 3.0 km. 22 refs., 32 figs., 39 tabs.

35658 (EPS–CP(EP)-2) **Recommendations on a preferred site for the ocean disposal of bulky inert materials in Beaufort Sea waters adjacent to the Northwest Territories.** Environnement Canada, Ottawa, ON (Canada). Conservation et Protection. 1987. 30p. (MICROLOG–88-06214). Available from Environment Canada, Library Services, Terrasses de la Chaudiere, 10 Wellington St., Ottawa, ON, Canada K1A 0H3; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Industrial operators in the Beaufort Sea region have noted a requirement to dispose of inert waste materials generated by hydrocarbon exploration or production activities. An assessment process was initiated in order to examine the option of marine disposal of these wastes at an appropriate site. The ultimate goal of this process is to select a preferred dumpsite that would meet certain specified criteria. This report provides an overview of all factors considered during the ocean dumpsite selection process and a rationale for the location selected as an offshore waste disposal site. It also summarizes the types and quantities of inert materials to be dumped, the physical and oceanographic characteristics of the potential dumpsite, and the environmental effects of ocean dumping. The recommended dumpsite is located near the upper edge of the continental slope at depths sufficient to allow unrestricted surface vessel travel. Wind and near-bottom current data are not currently available for the specific ocean dumpsite, but existing bottom current measurements indicate that mean velocities range between 7.4 and 10.8 cm/s and maximum velocities reach between 22.6 and 40.9 cm/s in the general vicinity of the recommended site. These maximum currents are not expected to be strong enough to remobilize bulky materials, although uncrushed steel drums could be rolled. Environmental effects are expected to be localized and short-lived, although some activities associated with ocean dumping could

elicit an avoidance response among bowhead and white whales. 21 refs., 7 figs., 4 tabs.

35659 (EPS–CP(EP)-3) **Selection of an area in the Canadian Beaufort Sea for disposal of inert bulky materials such as scrap metal. An assessment of options.** Environnement Canada, Ottawa, ON (Canada). Conservation et Protection. 1986. 68p. (MICROLOG–88-06215). Available from Environment Canada, Library Services, Terrasses de la Chaudiere, 10 Wellington St., Ottawa, ON, Canada K1A 0H3; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The purpose of this project was to assess the constraints that might affect the designation of a bulky inert waste ocean disposal site in the Canadian Beaufort Sea, and to recommend one or more preferred dumpsite locations. The possible ocean dumping needs of northern business and alternate modes of waste transport were examined. A decision matrix was used to determine the degree of acceptability for dumpsite selection of areas of the Beaufort Sea. The screening of areas was based on a review of the nature, quantities, and sources of wastes to be dumped, the factors affecting dumpsite selection (including biotic populations, pertinent climatological, oceanographic, and ecological features, government legislation and policies, oil and gas development, shipping, and other uses of the sea) and the effects of ocean disposal of bulky inert wastes. For wastes stockpiled at Tuktoyaktuk, the closest acceptable ocean disposal areas would be located approximately 160 km away. The cost per trip to the acceptable areas is estimated at $43,000. The closest acceptable disposal area from King Point (Yukon) is located 50 km to the north northeast. Several other acceptable and potentially acceptable areas are located within 170 km of King Point. Depending on which area is selected, the round-trip costs would range from about $28,000 to $45,000. It is recommended that dumping take place from a barge or oilfield supply vessel during the open-water season. The material should be carefully released from a stationary vessel to minimize the zone of impact, and all subsequent loads should be dumped to the side to ensure that the material does not pile up and create a navigational hazard. 55 refs., 8 figs., 2 tabs.

35660 (HBBT–ESRF093) **Handling and disposal of waste drilling fluids from on-land sumps in the Northwest Territories and Yukon.** Schilder, V.; Soniassy, R. Hardy BBT Ltd., Edmonton, AB (Canada); Stanley Associates Engineering Ltd., Edmonton, AB (Canada). 1988. 66p. (MICROLOG–89-00752). Available from Canada Oil and Gas Lands Administration, 355 River Rd., 15th Floor, Tower B, Ottawa, ON, Canada K1A 0E4; $17.50 CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This publication is a consolidation of two reports on the disposal of waste drilling fluids from on-land wells in northern Canada. The general objectives of the reports were to examine current practice, to consider future drilling needs and to recommend: improvements in methods of disposing of waste fluids; the suitability of methods for different well types and locations; and the regulation of disposal. The report data were obtained from a literature review, interviews and a workshop. Current practice in the North is to attempt total containment by disposing of fluids in a sump which is then backfilled. Decanting is rarely planned, although it has been used on an emergency basis when sumps are overfilled. Direct on-land disposal has been attempted once as an experiment. There are three reasons for concern about the disposal of drilling fluids. The first is their toxicity to living organisms and the second the potential for terrain damage that may accompany sump construction or disposal on to the ground surface, especially where permafrost is present. The practice of total containment for the disposal of drilling fluids in the North is generally endorsed. However, it is recommended that definition be made of conditions under which partial or non-containment, including emergency decanting, might be used. Also recommended is the development and adoption of a toxicity test that can be applied quickly to fluids awaiting disposal during a drilling operation. In addition, detailed recommendations are presented which are intended to improve regulatory practices and to reduce or avoid practical problems encountered in disposing of drilling fluids. 47 refs.

35661 (ESL–ESRF089) **Distribution, abundance and age segregation of bowhead whales in the southeast Beaufort Sea, August-September 1986.** Ford, J.K.B.; Cubbage, J.C.; Norton, P. ESL Environmental Sciences Ltd., Vancouver, BC (Canada); Cascadia Research Collective, Olympia, WA (USA); PN Research Projects, Sydney, BC (Canada). 1987. 103p. (MICROLOG–89-00754). Available from Canada Oil and Gas Lands Administration, 355 River Rd., 15th Floor, Tower B, Ottawa, ON, Canada K1A 0E4; $19.00 CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Aerial systematic and photogrammetric surveys were conducted in the southeast Beaufort Sea during August and September 1986, to investigate the distribution, relative abundance, and age segregation of bowhead whales in relation to petroleum industry activities in the region. The distribution and abundance of bowheads was similar during both survey periods. Most whales were located in an area in Mackenzie Bay about 40-60 km offshore of Shingle Point, within a band 40-100 km offshore of the eastern Tuktoyaktuk Peninsula, and near the Yukon coast and Herschel Island. Bowhads have been observed to congregate in each of these regions during some of the previous years of systematic surveys. It is likely that large-scale oceanographic phenomena lead to high densities of zooplankton in each of these areas during some years, and whales seen in these areas of concetration during 1986 appeared to be feeding. A total of 109 bowheads were as measured in the photogrammetric component of the study. As found in earlier studies the population was geographically segregated by age. In 1986, there was considerably less industry activity in the study area than in recent years, yet whales were still uncommon in the industrial zone. This suggests that the distribution of whales was determined by other factors, likely those influencing the distribution and abundance of their prey. However, mature whales were again under-represented in the photogrammetric sample, and the remaining portion of this component of the population was probably located outside the study area. Available evidence suggests that the distribution of bowheads in the southeast Beaufort Sea is naturally segregated by age class. 47 refs., 18 figs., 18 tabs.

35662 (STF–21A87099) **Oil at shore and in deposits. Successive report 1987.** Sveum, P.; Danielsen, A.; Klokk, T. Selskapet for Industriell og Teknisk Forskning, Trondheim (Norway). Dec 1987. 25p. (In Norwegian). Order Number DE89776218/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

Two deposits of oil containing mass have been inspected, the Brattholmen in Troms and the Tenna at Helgeland. Degradation aspects are studied. Both deposits have anaerobic conditions and hydrocarbons are slowly degraded. The Tenna leaks oil. Principles for treating oil contaminated wastes in biologically active deposits are discussed, with process simplification in mind. Degradation rate is low and connected to the degradation. The time perspective is 9-10 years. The results are concequently not final. The oil contaminated mass stranded at the Utoey island following the wrecking of Deifovos, was degraded to a satisfactory level during 3-4 years. The mass had a low oil content. It is important to distinguish between depositing and composting. The latter method can lead to quite high degradation rates by mechanically keeping oxygen supply at an acceptable level. Three shores polluted by oil spills some years ago are visited, the Bratholmen and the Kiloey islands which were polluted in 1980 by the Deifovos wreck, and a shore at Agdenes experimentally polluted in 1983. The latter shore is restored from a botanic view-point. Areas treated with manure are restored quicker than untreated shores. The Brattholmen shore has still considerable oil quantities caracterized as asphalt. The macrofauna, and to some extent the microfauna, is considerably restored. Macroalgae are however, colonizing more slowly than expected. The Kiloey shore is "clean" in the eulittoral zone and the macrofauna is mostly restored. The macroalgae have colonized the shore to a larger extent than at the Brattholmen. The vegetation is well developed in the supralittoral zone although asphalt is present in the soil and cracks. 7 drawings, 2 tabs.

35663 (AOSTRA–8808, pp. 20) **Improved techniques for measuring heavy crude oil vapor pressures for monitoring tank emissions.** Burke, N.E.; Chea, C.K. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

Current methods for calculating crude oil storage tank emissions involve knowledge of the vapor pressure of the stored crude and the molecular weight of the emitted vapor. Techniques now used to measure the vapor pressures of hydrocarbon mixtures do not yield accurate results for heavy crudes. This paper describes a technique for measuring the vapor pressure of heavy crudes using headspace gas chromatography, (HGC). This method provides the composition and molecular weight of the emitted vapor. A major advantage of HGC is its ability to determine the vapor pressure exerted by the polluting hydrocarbons alone and ignore the vapor pressure contributions from water or non-reactive hydrocarbons. With the instrumentation used, HGC is reproducible and can be easily automated for routine testing. The accuracy of the HGC method has been verified through vapor pressure measurements performed on n-haxane. To provide a theoretical basis for comparison, the results from the HGC techniqe have also been compared with vapor pressure data obtained on heavy crudes by pressure-volume-temperature (PVT) measurements and equation of state simulations. Results indicate that the headspace method is accurate and that it is more sensitive and requires less sample than either PVT methods or conventional techniques. 7 refs., 8 figs., 10 tabs.

35664 (NIPER–403) **Thermodynamic equilibria in the biphenyl/hydrogen system (The power and limitations of group additivity estimations): Topical report.** Steele, W.V.; Chirico, R.D. National Inst. for Petroleum and Energy Research, Bartlesville, OK (USA). Jul 1989. 25p. Sponsored by DOE Fossil Energy. DOE Contract FC22-83FE60149;FG02-87ER13785. Order Number DE89000754/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Calculated equilibria in the biphenyl/phenylcyclohexane/bicyclohexane/hydrogen system are presented and compared with experimental values reported in the literature. Gibbs energies of formation were estimated for phenylcyclohexane and bicyclohexane using group-additivities. The results were combined with values for biphenyl obtained from experimental thermodynamics to calculate the equilibria in the system. Under thermodynamic equilibrium conditions the maximum concentration of phenylcyclohexane obtainable is approximately 60 mole per cent. As the temperature is increased this maximum concentration can only be obtained by a corresponding increase in hydrogen pressure. In a given temperature regime, too high a hydrogen pressure will facilitate the formation of the fully saturated compound, bicyclohexane, and too low a hydrogen pressure the formation of biphenyl. Equilibrium conditions for the generation of hydroaromatics have been defined. Hydrogen transfer from a donor molecule (here tetralin) to an aromatic acceptor (here biphenyl) is favored by low temperature and a large excess of the donor over the acceptor. The report concludes that an order of magnitude improvement in the additivity methodology (increase in the accuracy and precision of the group-contribution term parameters) is required to enable meaningful calculation of the conditions under which thermodynamic equilibria exist in the hydrogenation of multi-ring aromatic systems. 27 refs., 6 figs., 6 tabs.

35665 (NRCC/IMR–29092) **Laboratory investigation on the evaluation of crude oil concentration by spectroscopic methods.** Cielo, P.; Cole, K. National Research Council of Canada, Boucherville, PQ (Canada). Industrial Materials Research Inst. 1988. 21p. (MICROLOG–89-00542). Available from Canada Institute for Scientific and Technical Information, Montreal Rd., Ottawa, ON, Canada K1A 0S2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

A Fourier transform infrared transmission spectroscopy approach for oil-in-water concentration monitoring was investigated. Transmission spectra of crude oil and water samples of typically 1 mm thickness were taken, using cells with windows of either potassium bromide or barium fluoride. A near-infrared spectrum was chosen for this application for a number of reasons, including a lower absorptivity which facilitates the possibility of obtaining a suitable absorptivity signal with a conveniently large cell thickness. The ability of the spectroscopic method to differentiate the spectral absorption bands of the oil and water is discussed. Possible problems in taking spectral measurements are mentioned, including attenuation by scattering from oil-water interfaces in an emulsion, and the possible variations in spectral characteristics for different kinds of crude oil. The possibility of extending such spectral measurements to an in-situ device for direct use in oil wells is also discussed. 3 refs., 6 figs.

0250 Combustion

35666 (AD-A–205281/9/XAB) **Laboratory evaluation of MIL-T-83133 JP-8 fuel in army diesel engines. Interim report, October 1984-January 1988.** Likos, W.E.; Owens, E.C.; Lestz, S.J. Southwest Research Inst., San Antonio, TX (USA). Belvoir Fuels and Lubricants Research Facility. Jan 1988. 278p. (BFLRF–232). Available from NTIS, PC A13/MF A01.

To support the need to upgrade aviation turbine fuel JP-8 from 'emergency' to 'alternate' status for diesel-powered equipment and to further advance its use as a single-fuel concept, four Army diesel engines were evaluated by dynamometer tests in cyclic endurance test procedures using JP-8 fuel and compared to baseline performance using diesel fuel (DF-2). Results showed the advantages for JP-8 fuel to include: Increased engine efficiency at the maximum power conditions, Lower rate of cylinder combustion chamber deposit formation, Less contamination of the engine lubricant, Less wear of the upper ring area, Lower rate of depletion of the lubricant additives, Less corrosive wear of the engine bearings, and Fewer deposits on the fuel injectors. JP-8 was found to be satisfactory for use in all engines tested. Abnormal wear occurred in the fuel injection pump of the GM 6.2L engine while operating on JP-8 during an engine dynamometer test. This wear resulted in higher fuel-delivery rates and erratic injection timing. Later field tests did not show such wear problems. the use of JP-8 in the diesel-engine powered vehicles holds some advantages, notably for the engine and oil durability for most engines tested. The disadvantages include reduced vehicle range and reduced maximum power.

35667 (DOE/FE–0134) **Unconventional gas recovery program plan, FY 1989.** USDOE Assistant Secretary for Fossil Energy, Washington, DC (USA). Office of the Deputy Assistant Secretary for Oil, Gas, Shale and Special Technologies. Jun 1989. 32p. Sponsored by DOE Fossil Energy. Order Number DE89013911/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The ability to convert natural gas cheaply and efficiently into a transportable fuel such as gasoline would not only open new markets for presently "usable" gas but would greatly contribute to reduction of petroleum imports to the United States. Achievement of this desirable use for natural gas is contingent on the availability of a conversion process which produces a high yield of a transportable liquid fuel which has favorable energy density, combustion, and environmental characteristics. DOE's specific technical objectives for the Unconventional Gas Recovery (UGR) program are presented. 11 refs., 4 figs., 2 tabs.

35668 (PB–89-173686/XAB) **GRI (Gas Research Institute) catalog of technical reports.** Cramer, T.L. Gas Research Inst.,

Chicago, IL (USA). Jan 1989. 112p. (GRI–89/0068). Available from NTIS, PC A06/MF A01.

Gas Research Institute (GRI) plans, manages, and develops financing for a cooperative research and development program in gaseous fuels and their use. The catalog provides a cumulative listing of all contractor R&D reports issued by GRI since its establishment that are available from the National Technical Information Service (NTIS). Abstracts are provided for those reports that have become available from NTIS since the last catalog (September 1985). Indexes by subject, contractor, contract number, GRI report number, and NTIS order number are included, as are instructions for ordering reports from NTIS.

35669 (PB–89-177802/XAB) **Technology 'Master List' data base management system. User's manual. Topical report.** Rimpo, J.Y.; Owens, M.J. Economic Systems Analysis, Inc., Oak Ridge, TN (USA). Sep 1988. 111p. Available from NTIS, PC A06/MF A01.

In order to track the movement of Gas Research Institute (GRI) projects from the drawing-board concept to commercialized product, GRI developed a 'Master List' of these technologies and research applications. An interactive data base management program (titled 'WIN') was developed to permit manipulation and updating of the 'Master List' data base. The user's manual provides information on using this data base management program, including record management (adding, editing, deleting, and moving records), report generation (selecting, sorting, and printing), and data base maintenance. The system is designed to be used with the dBase III Plus software on IBM or compatible personal computers.

35670 (DOE/MC/24219–2705) **Characterization and utilization of natural gas in Alaska: Final report.** Sharma, G.D. Alaska Univ., Fairbanks, AK (USA). Mar 1989. 70p. Sponsored by DOE Fossil Energy. DOE Contract FG21-87MC24219. Order Number DE89000992/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

The natural gas in the Alaskan arctic represents a truly significant resource; a resource which should be exploited in the most appropriate manner. Currently, the proven reserves of natural gas in Alaska are estimated to be 19.7% (36.7 TSCF) of the total US reserves (186.7 TSCF). In addition, the undiscovered recoverable natural gas resources of Alaska are about 89 TSCF compared to 610 TSCF in the lower 48 states. Furthermore, the Alaskan unconventional gas resources are more than 500 TCF. The purpose is to review the potential of natural gas resources in Alaska and to address various important issues related to utilization of natural gas. This report provides a brief summary of various gas fields and their geologic settings. The different options for utilization of natural gas to lower 48 states via gas pipeline, conversion to liquefied natural gas and transport, conversion to fuel grade methanol and/or gasoline, natural gas for enhanced oil recovery, gas based petrochemical complex, gas utilization in the form of utilities are critically reviewed with respect to merits and demerits addressing engineering, economic, environmental, supply/demand, market and political aspects. 22 refs., 2 figs., 5 tabs.

Geologic and engineering data for selected low-permeability gas formations were compiled to provide a basis for selecting potential sites for the Gas Research Institute's (GRI) fourth Staged Field Experiment (SFE) and cooperative wells with industry. Increasingly detailed screening criteria were applied to 189 documented tight-gas settings to designate twelve candidate formations for GRI field research. Technical selection criteria were established to ensure that resulting field research addressed the resource potential of a formation, recognized scientific challenges to be overcome, and maximized opportunities for technology transfer. Four formations are in the Rocky Mountains, two in the Appalachian Basin, two in the Denver Basin, and one each in the San Juan, Permian, Anadarko, and Texas Gulf Coast basins. The formations represent a range of current development and technical challenges. Four of the twelve formations were identified as having highest potential: the Abo, Corcoran-Cozzette/Mesaverde, Frontier, and Cleveland. More detailed characterization of these four priority formations appears in Volume II of the report.

35673 Characterization and implications of dickite-mineralized fractures in Mesaverde core from Piceance Creek basin. Finley, S.J. (Sandia National Labs., Albuquerque, NM (USA)); Lorenz, J.C. *AAPG (American Association of Petroleum Geologists) Bulletin (USA),* 73(3): 355 (Mar 1989). (CONF-890404–: AAPG annual convention with DPA/EMD Divisions and SEPM, San Antonio, TX, USA, 23-26 Apr 1989).

The presence of authigenic dickite, a polymorph of kaolinite, in fractures in the gas-productive Mesaverde Formation of the Piceance Creek basin may indicate a locally interconnected fracture system. Core used in this study is from the US Department of Energy's Multiwell Experiment located in the Rulison field in northwestern Colorado. The Mesaverde is fractured throughout the 4000-ft section cored at this location. Although spray calcite is the most common fracture mineralization throughout the section, dickite mineralization commonly occurs as a secondary phase in fractures within a roughly 400 ft-thick interval. The petrography of the host rock where these fractures are concentrated is similar to the petrography of other core intervals where dickite mineralization and/or irregular fractures were not detected. No apparent difference is seen in the mineral constituents or the diagenetic alteration of the minerals present, suggesting that the source of the dickite may have been extraformational. If the dickite is extraformational, the variation in the orientations of these anomalous dickite-mineralized fractures, coupled with the presence of dickite on some other types of fractures, implies that at some time in the depositional and burial history of the rock the dickite fractures represented an interconnected fracture system. Microporosity is associated with the dickite mineralization, and this fracture system may still be locally interconnected and permeable making this a potentially gas-productive interval. Special consideration of drilling and/or stimulation fluid interaction with dickite may be necessary.

35674 (DOE/EIA–0130(89/04)) **Natural gas monthly: April 1989.** USDOE Energy Information Administration, Washington, DC (USA). Office of Oil and Gas. 26 Jun 1989. 147p. Sponsored by DOE Management & Administration. Order Number DE89014078/JAW. Available from NTIS, PC A07/MF A01 - GPO - OSTI; GPO Dep.

The Natural Gas Monthly (NGM) is prepared in the Data Operations Branch of the Reserves and Natural Gas Division, Office of Oil

and Gas, Energy Information Administration (EIA), US Department of Energy (DOE). The NGM highlights activities, events, and analyses of interest to public and private sector organizations associated with the natural gas industry. Volume and price data are presented each month for natural gas production, distribution, consumption, and interstate pipeline activities. Producer-related activities and underground storage data are also reported. From time to time, the NGM features articles designed to assist readers in using and interpreting natural gas information. The data in this publication are collected on surveys conducted by the EIA to fulfill its responsibilities for gathering and reporting energy data. Some of the data are collected under the authority of the Federal Energy Regulatory Commission (FERC), an independent commission within the DOE, which has jurisdiction primarily in the regulation of electric utilities and the interstate natural gas industry.

35675 (PB–89-173595/XAB) **Stretford chemistry and analytical methods handbook. Topical report.** Andrews, E.M. Radian Corp., Austin, TX (USA). Feb 1989. 195p. (DCN–88-218-043-45). Available from NTIS, PC A09/MF A01.

GRI has developed a handbook on the chemistry and analytical methods for monitoring the Stretford process. The document presents information on process chemistry and laboratory guidelines, and sampling, preservation, and analytical methods. The first sections contain information about the process and its chemistry, and guidance on setting up and operating a Stretford analytical laboratory. A compilation of twenty analytical methods for monitoring the Stretford process including methods for sulfur species, ADA methods, vanadium methods, carbonate methods, complexing-agent methods, gas analysis, sulfur cake methods and miscellaneous-process measurements are listed in the second half of the handbook.

35676 (PB–89-181168/XAB) **Reservoir Engineering and Treatment Design Technology. Annual report, December 1987-November 1988.** Murtha, J.A.; Gatens, J.M.; Hopkins, C.; Lancaster, D.E.; Lane, H.S. Holditch (S.A.) and Associates, Inc., Bryan, TX (USA). Dec 1988. 169p. Available from NTIS, PC A08/MF A01.

See also PB–88-203211.

This report presents an overview of the Comprehensive Study Well (CSW) program along with status reports on five of the CSW's drilled to date in this second year of the 'Reservoir Engineering and Treatment Design Technology' program. The focus for 1988 was design, monitoring, and evaluation of fracture treatments. The activities include gathering and analyzing data from both pre- and post-stimulation well tests and from the stimulation treatments themselves. Results identified in the report include the evolution of a treatment design simple both in concept and execution but which should create a desirable highly conductive propped fracture; the identification of key problems remaining to be solved in design, execution, and cleanup; the continued progress in determining in-situ stress profiles from log-based measurements; and developments in the research with analytical models and gas desorption studies.

35677 (MPUB–7389) **Application by Greater Winnipeg Gas Company and ICG Utilities (Manitoba) Ltd. for an order or orders approving rates for the sale of natural gas from November 1, 1988 to October 31, 1990, flowing from new gas supply contracts.** Manitoba Public Utilities Board, Winnipeg, MB (Canada). 1989. 10p. (CE–02691). Available from Manitoba Public Utilities Board, 405 Broadway Ave., Rm. 1146, Winnipeg, MB, Canada R3C 3L6; $N/C.

This report summarizes the decisions resulting from the application of the Greater Winnipeg Gas Company and the Inter-City Gas (Manitoba) Ltd. (the Companies') to the Public Utilities Board (the board) for rates arising from their new gas supply arrangements with Western Gas Marketing Limited and other matters. The arrangements provide for a firm long term supply of gas for the companies' entire requirements for the net 15 year period. The Board determined that its jurisdiction extends to the approving or otherwise the retail rates put forth by the Companies. The Board determined that the applied for rates, subject to certain adjustments for timing, are just and reasonable. The Board emphasized that it will assess the reasonableness of future rates beyond the initial 2 year period on the merits of the Companies' future applications. Any future financial risk associated with these contracts must be borne by the Companies and more specifically by the Companies' shareholders. 2 tabs.

35678 (OEB–32) **Gas supply. Reference from the Lieutenant Governor in Council.** Ontario Energy Board, Toronto, ON (Canada). 1988. V (MICROLOG–89-02266). Available from Publications Ontario, 880 Bay St., 5th Floor, Toronto, ON, Canada M7A 1N8; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

A public hearing was held by the Ontario Energy Board into matters pertaining to the current and future supplies of natural gas required to meet the needs of Ontario gas consumers. This report presents the views of the parties involved, and the recommendations of the Board, on principles of security of supply, short-term supply arrangements (backstopping, diversity), long-term supply arrangements (continental market/free trade, supply/demand balance, transportation capacity, market segmentation), security of supply (short-term, contract terms and conditions, market access and obligation to supply, relative price among groups, competition among suppliers and market access), arbitration provisions, and implementation.

35679 (AOSTRA–8808, pp. 8) **Unique completion practices in a horizontal well.** Wilkins, D.A. (Moore and Associates, Amarillo, TX, USA); Shursen, G.; Yost, A.B.; Overbey, W.K. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

This paper discusses some new and unique completion practices which were implemented in a horizontal well in the Devonian shale formation, Wayne County, West Virginia. The well was successufully completed and tested in 7 different intervals along the 2000 ft horizontal section without the aid of cementor perforating. External casing packers and port collars were utilized to isolate the intervals, each of which was opened and closed to the wellbore numerous times throughout the testing. Bottomhole assemblies were designed and used to test one or more intervals up a single string of tubing while monitoring one or more different intervals up the tubing-casing annulus. Selected intervals have been stimulated using a variety of treatment designs in efforts to optimize production. Specialized surface and downhole equipment were used to monitor pressures and production rates throughout the testing. The completion techniques used in this well are unique to the industry and have provided optimum test results with very little effort, risk, or cost. 1 ref., 3 figs., 3 tabs.

35680 (PB–89-178164/XAB) **Fracture-height growth containment using low-permeability bridging agents to stimulate tight gas sands with weak barriers. Topical report, January 1982-March 1985.** Kelkar, S.; Strawn, J.; Holland, M.; Owen, L.; Hansen, J. Terra Tek, Inc., Salt Lake City, UT (USA). Mar 1985. 144p. (TR–85-87). Available from NTIS, PC A07/MF A01.

This report evaluates the feasibility of using bridging agents to control fracture height growth in tight (low permeability) gas formations bounded by base rock and/or overlain by an overburden rock, which are not barriers to fracture migration. The bridging-agent technique is one of the four proposed modified hydraulic fracturing

techniques that attempts to improve gas production from tight formations by controlling fracture migration. Analytical models for determining fluid pressure profiles within the fracture, and for determining flotational velocities for the bridging agent slurry were also developed.

35681 (PB–89-181432/XAB) **Measurement of static coalbed-reservoir conditions for hydraulic-fracture design. Volume 2. Final report, March 1983-December 1986.** Boyer, C.M.; Briscoe, F.H.; Camp, B.S.; Dobscha, F.X.; Malone, P.G. USX Corp., Monroeville, PA (USA). USS Technical Center. Dec 1986. 787p. (REPT–76-H-088/089). Available from NTIS, PC A99/MF E04.

See also PB–88-118252. Portions of this document are not fully legible.

A single-zone coalbed methane well was completed into the Mary Lee and Blue Creek coal seams in the Warrior basin of Alabama to evaluate the geologic and reservoir parameters that affect the stimulation and production of coalbed methane. Following the successful drilling and coring of the well, reservoir testing resulted in a measured coal seam permeability of 1 millidarcy and a skin factor of -4 to +1. In-situ state-of-stress tests in the Blue Creek coal seam indicated a vertical primary closure and a secondary horizontal closure. Coal and rock-core tests resulted in reservoir and mechanical values consistent with well-test data and underground-fracture observation.

35682 (NEB-SS–GH-2-87) **Reasons for descisions-TransCanada Pipelines Ltd. Requests pertaining to the installation and to the approval of the method of devising rights and of the connected questions about rates.** National Energy Board, Ottawa, ON (Canada). 1988. 154p. (In French). (MICROLOG–88-06005). Available from National Energy Board, Trebla Bldg., 473 Albert St., Ottawa, , Canada K1A 0E5; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

In a claim dated June 9 1987, and modified on September 17 of the same year, TransCanada Pipelines Ltd. required authorization to build new installations in order to increase the capacity of its pipeline network so as to supply existing markets and to deliver additional exports in the northeast United States. The total cost of the proposed installations was evaluated at $334 M. TransCanada also requested that the method of sharing costs and of devising rights, currently used by the National Energy Board, be still applicable to these new installations. This report discusses successively the new installations and their projected costs, the motives of the decisions taken by the Board about TransCanada's claim, the method for forecasting the additional volumes of exports, the obtaining o f the necessary authorizations in the United States, the problems raised by the export contracts of Alberta North East Gas from Niagara Falls and Iroquois (the Board reserved its decision concerning them), the utilization of lands, the method of devising rights, the modifying agreement between TransCanada and Great Lakes, Gas Transmission Company, questions pertaining to rates, and the conditions of access to the pipeline network of TransCanada. 4 refs., 13 tabs.

35683 (ERCB–D89-4) **Applications by Phillips Petroleum Resources, Ltd. for permits to construct pipelines to transport sour gas and fuel gas in the salter field.** Energy Resources Conservation Board, Calgary, AB (Canada). 1989. 20p. (CE–02693). Available from Energy Resources Conservation Board, 640-5th Ave. SW, Calgary, AB, Canada T2P 3G4; $N/C.

This report details the process and decisions following applications by Phillips Petroleum Resources, Ltd. for permits to construct pipelines; to transport sour gas and fuel gas in Alberta's Salter Field. The subject applications involve the tie-ins of four sour gas wells in the Salter Field and the installation of a sour gas and a fuel gas pipeline to connect the wells to the existing gas plan. The proposed pipeline facilities will conform to all the necessary standards and requirements for sour gas operation which have been designed to ensure the public's safety. Given the overall safety record of sour gas pipeline operations in the province of Alberta, the Board is satisified that this pipeline can be operated with little risk to the public. The Board believes the issues for considertion of these applications to be the need for the pipelines, corridor selection, and route selection. The Board is prepared to grant applications by Phillips Petroleum Resources, Ltd. subject to receipt of the approval of the Minister of the Environment respecting environmental maters, and subject to the conditions and restrictions as discussed in the body of this report. 2 figs.

35684 (PB–89-180160/XAB) **Transport and Storage (3.3) Subprogram for Gas Research Institute: status report - 1988 projects.** Gas Research Inst., Chicago, IL (USA). Mar 1989. 147p. (GRI–89/0076). Available from NTIS, PC A07/MF A01.

See also PB–88-205877.

This status report presents descriptions of the major issues, objectives, initiatives, and strategies of the Gas Research Institute Transport and Storage Research (T and SR) Subprogram, which is part of the GRI Gas Operations Research and Development Program. Included are Contract Summary Reports on the status of each research project as of January 1, 1989 in the seven project areas of the T and SR Subprogram. These project areas are: construction and maintenance; metering and operations; plastic piping materials evaluation and development; residential/commercial interior piping systems; gas storage technology; transmission piping systems; and advanced systems and sensor technology.

35685 **Threshold-stress determination using tapered specimens and cyclic stresses.** Fessler, R.R. (Battelle Columbus Labs., Columbus, OH (US)); Barlo, T.J. v.v of Environment-sensitive fracture: Evaluation and comparison of test methods. Dean, S.W.; Pugh, E.N.; Ugiansky, G.M. ASTM, Philadelphia, PA (1984). (CONF-820495–: ASTM symposium on environment sensitive fracture: evaluation and comparison of test methods, Gaithersburg, MD, USA, 25-28 Apr 1982).

Traditional methods of determining the threshold stress for stress-corrosion cracking involve testing a number of specimens that are loaded to various levels of constant initial stress. In research sponsored by the Pipeline Research Committee of the American Gas Association, it was shown that low-frequency, small-amplitude cyclic loads superimposed on a constant load can reduce the threshold stress substantially. Since such loading can occur on real structures, it was felt that the threshold stress should be determined under those more severe and realistic conditions. Furthermore, by using a specimen with a tapered gage section, a range of stresses could be evaluated in a single test, making it possible, in principle, to determine the threshold stress with one or two specimens. Test procedures involving tapered specimens and cyclic loads superimposed upon a constant load are described, and representative data for various line-pipe steels are presented. The test environment consisted of a water solution of sodium carbonate and sodium bicarbonate, and the temperature was controlled at 352 K (175^{0}F). the potential was controlled potentiostatically at the center of the range in which stress-corrosion cracking occurs. Test duration typically were 1 to 2 weeks.

0330 Properties

35686 (PB–89-173678/XAB) **Study of data distributions and functions for the development of thermodynamic equations of state. Annual report, June 1987-May 1988.** Jacobsen, R.T.; Beyerlein, S.W.; Bjornn, K.R.; Ostic, J.; Clarke, W.P. Idaho Univ., Moscow, ID (USA). Center for Applied Thermodynamic Studies. Jul 1988. 42p. Available from NTIS, PC A03/MF A01.

See also PB–88-196365.

The objective of the research is to provide guidelines for efficiently measuring and correlating thermodynamic property data used in developing highly accurate equations of state for fluids used in the natural gas industry. Fitting experiments were conducted with pseudo-data calculated from a highly accurate equation of state for ethylene. Results of these experiments were analyzed using region by region summaries of random errors, three-dimensional plots, and contour maps showing local deviations in predicted properties.

0340 Combustion

35687 (PB–89-140883/XAB) **Enhanced flame stability and soot radiation using electric fields. Annual report, July 1987-July 1988.** Berman, C.H.; Gill, R.J.; Calcote, H.F. Aerochem Research Labs., Inc., Princeton, NJ (USA). Oct 1988. 57p. (AEROCHEM-TP–476). Available from NTIS, PC A04/MF A01.

Enhanced stabilization of methane-air flames was achieved by application of dc electric fields of only a few thousand volts with a minimum electric-power dissipation, about 0.01% of the combustion power being controlled. Both the lean blowoff composition and the maximum blowoff velocity are markedly affected. The mechanism for this phenomenon is discussed in terms of an effect of the electric field on the boundary velocity gradient. The electric field applies an electric force on the chemiions in the flame, producing an electric wind which forces the flame closer to the burner rim both reducing the dead space and decreasing the boundary velocity gradient. The 'boiling' effect on a flat flame due to the application of an electric field, reported previously, is explained by an electron-cascade effect in which thermally produced electrons are accelerated by the electric field producing more charged soot particles. In a counterflow flame, periodic waves are produced by the electric field; an explanation has not been developed. The counterflow and flat flame apparatus, including the laser optical system for particle measurements in the flame has been completely redesigned for more rapid and especially more accurate data collection.

35688 (PB–89-173603/XAB) **Compact ceramic heat exchangers. Final report, February 1983-June 1988.** Coubrough, L.E.; Dobos, C.J.; Kleiner, R.N. Coors Ceramics Co., Golden, CO (USA). Jun 1988. 131p. Available from NTIS, PC A07/MF A01.

The objective of the project was to develop and field test a durable compact ceramic heat exchanger for improved process efficiency in industrial gas-fired furnace. A unique aluminum titanate ceramic material and crossflow recuperator design was developed and analyzed in laboratory testing in 1983 and 1984. Testing of the recuperator performance and system benefits began in the heat-treating industry on three separate direct-fired furnace installations. Over five years of trouble-free operation has produced operating cost reductions of 30 to 45% and productivity improvements up to 16%. In 1985, testing on a box forge furnace at temperatures up to 2250°F has provided 30% fuel cost savings. In 1987, application of this technology is being extended to radiant tube systems through design and laboratory testing of counterflow radiant tube recuperator packages.

04 OIL SHALES AND TAR SANDS

35689 (AOSTRA–8808) **UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.** Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. vp. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

A conference was held in Alberta to examine various aspects of heavy oil and oil sands research around the world. Papers were presented in the areas of drilling, recovery processes, upgrading, petroleum geology, economics, environmental issues, waste management, well completion, and oil sand or heavy oil analysis. Separate abstracts have been prepared for 46 papers from this conference.

35690 (AOSTRA–8808, pp. 7) **Legal framework for operation of government research and development agencies.** Hyndman, L.D. (Field and Field, Edmonton, AB, Canada); Spady, E.K. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02589). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sand, vol. 1.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

The Alberta Oil Sands Technology and Research Authority was established as a Crown corporation in 1974 for the purpose of encouraging the orderly and efficient development of the important hydrocarbon resource known as the Alberta oil sands. The mandate of the Authority, its investments, its ties with other countries, with the industry, with universities and research organizations are discussed. The Authority has a policy of disseminating publicly-funded technology at fair market value and of sharing the revenues received with the inventor or developer, based on the respective contributions to a given research project. The role of the Authority is not to directly compete with industry, but to provide financial and technical assistance to encourage industry to undertake development earlier than it would normally. The crisis in world oil prices may cause a reconsideration of the methods of funding technology development and of marketing the resultant product. The industry has become reluctant to fund research projects, and therefore the Authority has become more active in technology transfer, so as to gain licensing revenues. In the institutional sector, which includes universities, the Authority considers more carefully the kinds of projects for which funds are allocated. The efforts of the Authority over the past 13 years, through research and development and through pilot programs, have resulted in cost reductions and increased recovery such that commercialization of oil sands and heavy oil deposits is now possible, and economically viable at less than US $20 /bbl. 36 refs.

35691 (CU/FCE–8903) **Challenges and innovations 1989. 6th Annual heavy oil and oil sands technical symposium.** Calgary Univ., AB (Canada). Faculty of Continuing Education. 1989. vp. (CONF-8903126–: 6. annual heavy oil and oil sands technical symposium, Calgary, Canada, 8 Mar 1989;CE–02591). Available from Faculty of Continuing Education, University of Calgary, 2500 University Drive, N.W., Calgary, AB, Canada T2N 1N4; $30.00 CAN.

The papers in this symposium include oil recovery by artificial lifts, in situ combustion, and water and steam injection; temperature logging; interwell communication; horizontal drilling; heavy oil upgrading plants in Alberta and Saskatchewan, with emphasis on design criteria and process selection; prevention of formation damage; and a new energy-saving process for visbreaking of bitumens. Experimental data obtained both on the spot and in the laboratory are presented. Separate abstracts have been prepared for 11 papers from this symposium.

35692 (DOE/FE–0133) **Tar sands program plan, FY 1989.** USDOE Assistant Secretary for Fossil Energy, Washington, DC (USA). Office of the Deputy Assistant Secretary for Oil, Gas, Shale and Special Technologies. Jun 1989. 25p. Sponsored by DOE Fossil Energy. Order Number DE89013912/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The tar sands program is directed toward expanding the technical information base needed to develop advanced technologies for recovering oil from large, presently unrecoverable resources. The overall goal of the program is to foster industry development of economically competitive and environmentally acceptable recovery processes. Many technology barriers substantially limit development of the nation's tar sands resources to a small fraction of their potential as a source of petroleum liquids. Recovery process parameters are not fully understood; the amenability of deposits of varying chemical/physical makeup to different recovery process approaches needs further evaluation; and the expected variability of process cost factors, including the desirability of recovered products and the costs of mitigating process waste pollutants, requires research and assessment. The Department of Energy's (DOE's) technical objectives for the tar sands program relate to the research needs associated with specific functional and process information needs. These objectives are presented. 6 refs., 5 figs., 1 tab.

35693 (AOSTRA–8808, pp. 16) **Simulation of HASDrive UTF pilot.** Duerksen, J.H. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

Heated Annulus Steam Drive (HASDrive) shows promise as an effective tar sand enhanced oil recovery process based on laboratory tests and simulation studies. The development of the Alberta Oil Sands Technology and Research Authority Underground Test Facility (UTF) in the Athabasca tar sand deposits has provided an opportunity to field-test the HASDrive process to confirm laboratory observations and validate numerical simulation results. The HASDrive pilot consists of a horizontal HAS pipe and a horizontal producing well, both drilled from a UTF tunnel; and a vertical steam injection well and six observation wells, all drilled from the surface. A pilot simulation study was conducted to predict steam injection rates, fluid production rates, reservoir temperatures, pressures and fluid saturations. The study evaluated the effects of the HAS pipe heat transfer coefficient, steam injection pressure and quality, and producer back pressure. The results of the simulation study presented in this paper provided design input for the HASDrive UTF pilot. 9 refs., 10 figs., 8 tabs.

35694 (AOSTRA–8808, pp. 2) **Fluvial, estuarine and shallow marine sedimentation in the Lower Cretaceous McMurray Formation and Wabiskaw Member (Clearwater Formation), in the central region, Athabasca oil sands area, northeastern Alberta.** Keith, D.A.W (Alberta Research Council, Edmonton, AB, Canada); Wightman .M.; Pemberton, S.G.; MacGillivray, J.R.; Berezniuk, T.; Berhane, H. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

Examination of over 400 well logs and 34 cores allows determination of the geological setting, lithofacies patterns and depositional history of the McMurray formation and Wabiskaw Member of the Clearwater Formation in the central region of the Athabasca Oil Sands area. The principal control on sand distribution in central Athabasca is the topography of the underlying subcretaceous unconformity. This surface is generally low in the east and higher in the west toward the Paleozoic Grosmont High. The McMurray displays a corresponding thinning from greater than 100m in the east to less than 5m in the western part of the study area. A number of Paleozoic ridges control McMurray Formation sedimentation styles and can be used to divide the study area into two distinct regions: an eastern region with two valley systems and a western region. The eastern region is dominated by channelized McMurray Formation sands occurring within two valley systems. Deposition within the valley systems reflects transgressive valley fill sedimentation. Amalgamated fluvial channel and offchannel deposits generally initiate the successions and grade upward into brackish muddy deposits. Sandy estuarine sediments are also present in the middle to upper part of the McMurray. Marine Wabiskaw Member siltstones and mudstones blanket the eastern valleys. The western region shows no influence of the eastern valley systems. It consists of abrupt alternations of marine or brackish and continental deposits that probably accumulated within a bay fill setting. Here, thin tabular sands in the upper part of the McMurray Formation and thicker, laterally extensive sands in the Wabiskaw Member are developed. 17 refs., 30 figs., 1 tab.

35695 (AOSTRA–8808, pp. 18) **The McMurray formation in the Athabasca oil sands area: an ichnological and paleontological perspective.** Mattison, B.W. (Univ. of Alberta, Edmonton, AB, Canada); Pemberton, S.G. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

Paleontologic and ichnologic study of the McMurray Formation in the Athabasca Oil Sands area reveals that this unit was deposited within a marginal-marine estuarine setting during the initial transgressive phase of the Lower Cretaceous Clearwater Sea. A depositional environmental evolution from coastal fringing lacustrine or paludal environments into a range of estuarine environments and finally into shoreface or nearshore shoal environments is recorded in vertical and lateral facies associations preserved in the formation. High-grade oil sand reservoirs are found within estuarine channels in the middle unit of the McMurray formation. Because of the high cost of oil sands mining procedures and because of the nature of the mining process itself, mapping the trends of these channels is extremely important, since accurate prediction of channels allows for the extraction of oil sand with the mining of as little waste rock as possible. Ichnologic trends within both channelized and nonchannelized deposits in the middle member of the formation indicate proximal and distal relationships to sandy channelized reservoirs. Recognition of distinct suites of trace fossils within this unit may thus be an economically invaluable facies mapping tool. 43 refs., 8 figs.

35696 (AOSTRA–8808, pp. 20) **Geology and resources of the primrose crude bitumen deposits northeastern Alberta.** Beckie, K.N. (AEC Oil and Gas Co., Alberta Energy Co. Ltd., Calgary, AB, Canada); McIntosh, R.A. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

The large 5200 km^2 Cold Lake Air Weapons Range (Primrose Block) was unexplored prior to 1978. Since then, aproximately 8 x 10^9 m^3 of in- place crude bitumen plus significant volumes of natural gas have been delineated. These oil sands represent the southern limits of the giant Athabasca deposit and northern limit of the Cold Lake deposit. The Primrose Block straddles the regional, southerly plunging Athabasca anticline which is the primary controlling factor for entrapment of these oil sand deposits. The crude bitumen resources occur largely in two deltaic sand bodies within the Clearwater Formation and within fluvial sands of the McMurray Formation. Both of these formations are part of the Lower Cretaceous Mannville Group. The McMurray consists of quartzarenites to subarkosic sands with a significant compositional change in the overlying Clearwater Formation to litharenites. Both formations exhibit shallow burial and high primary porosities (averaging 34% to 38%). There is also some secondary porosity developed in the Clearwater Formation due to framework grain dissolution. Permeabilities in the Clearwater, particularly in its basal Wabiskaw Member, have been reduced considerably by the presence of authigenic and detrital clays. The average range in permeabilities is from 2 to 4 darcies. 7 refs., 14 figs., 1 tab.

35697 (AOSTRA–8808, pp. 20) **A quantitative approach to the geological evaluation of the tar sands of south Athabasca, Alberta.** Ranger, M.J. (Univ. of Alberta, Edmonton, AB, Canada); Pemberton, S.G. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

In the South Athabasca area, traditional approaches to determining the spatial distribution of the bitumen resource, as well as the

spatial variation in its physical and chemical properties, are becoming untenable due to the vast and ever-increasing amount of available data. An ancient horizon that can be used for structural studies is the erosional unconformity at the base of the McMurray Formation reservoir. There are many anomalies in the relationship between the formation thickness and the structure on the unconformity, and these anomalies can be differentiated into three distinct populations. Resolving these populations using multivariate statistical analysis and mapping the results provides new insight into the basinal structure and suggests the presence of major normal faults parallel to the basin strike and downthrown to the southwest. A rigorous and objective analysis of geophysical well logs has also been performed. Using new techniques for digital pattern recognition, particularly the application of spectral analysis using the Fourier transform, enables curve patterns to be quantified numerically. The magnitude of the spectral coefficients of the curves can be used to compare and correlate patterns from well to well with the help of cluster analysis techniques. These techniques are realizing their potential to provide a new geological perspective of the South Athabasca basin. 11 refs., 13 figs., 2 tabs.

35698 (AOSTRA–8808, pp. 21) **Geology of the AOSTRA underground test facility site.** Rottenfuss, B.A.; Palfreyman, J.E.; Alwast, N.K. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

At the Alberta Oil Sands Technology and Research Authority Underground Test Facility (UTF), three horizontal well pairs have been drilled up into the overlying Cretaceous oil sands from tunnels within the underlying Paleozoic carbonates. Each well pair consists of an injection well and a production well, located at approxomately 7m and 2m above the base of the oil sands, respectively. Steam is supplied by injection into the overlying well of each horizontal pair and the condensate and bitumen are collected from the underlying well. A grid of 28 vertical boreholes penetrates the area around the horizontal wells. An extensive suite of geophysical logs and 514 M of core (supplemented by core analysis for grain size, bitumen saturation, porosity and permeability) provide the basis for a detailed geological characterization of the reservoir. At the UTF site, the Cretaceous McMurray Formation is 37m thick. The bottom 20m of rich oil sands is interrupted by several shaly zones. Most are either shale breccias or heavily burrowed shales, both of which are likely to have some vertical permeability. Overlying the rich oil sands, 17m of interbedded oil sand and shale grade up to a sandy shale at the top of the formation. The McMurray is overlain by 2m of water saturated Wabiskaw sand which is capped by thick shales of the Clearwater Formation. The objective of the geological studies is to provide the parameters to build a detailed reservoir model that reflects the heterogeneities of the test site. The model will be instrumental in evaluating the effect of geology on development of the steam chambers during the life of the pilot. 6 refs., 15 figs.

35699 (AOSTRA–8808, pp. 25) **Resource characterization of the central region of the lower Cretaceous McMurray/Wabiskaw deposit, Athabasca oil sands area, northeastern Alberta.** MacGillivray, J.R. (Alberta Research Council, Edmonton, AB, Canada); Wightman, D.M.; Keith, D.A.W.; Bell, D.D.; Berhane, H.; Berezniuk, T. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02589). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sand, vol. 1.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

The McMurray/Wabiskaw Deposit (Mannville Group) of the Athabasca Oil Sands area is the largest bitumen deposit in Alberta. A suite of isopach maps (total sands, oil sands) of the McMurray Formation and Wabiskaw Member of the Clearwater Formation have been prepared between Townships 80 to 90, ranges 1 to 18w4. Water sands, bottom water sands, and gas sands isopach maps were also prepared for the McMurray Formation. Bitumen distribution is closely related to sand distribution and the bitumen trapping mechanism appears to be a result of stratigraphy, structure, and biodegradation. Topography on the sub-Cretaceous unconformity resulting from differential erosion and salt dissolution has controlled McMurray Formation deposition. In contrast to the McMurray Formation sedimentation that infilled topographic lows on the sub-Cretaceous unconformity, the overlying Wabiskaw Member was developed on a flatter surface. The various regions of both formations are discussed. 19 refs., 19 figs.

35700 (AOSTRA–8808, pp. 13) **Calculating the maximum horizontal wellbore length.** Carden, R.S. (Grace, Shursen, Moore and Associates, Amarillo, TX, USA). Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

The question often arises as to how much horizontal wellbore can be drilled, as the length of the horizontal wellbore will be limited by drag, torque and pipe stresses. A simple mathematical model was developed to predict the amount of torque and drag in a horizontal well. In most directional wells, the drag while pulling pipe is the limiting factor. However, in horizontal wells, the drag while running pipe (down drag) and the torque are usually the limiting factors. The down drag is further complicated when buckling imposes an additional drag force which can exceed the weight of the pipe even in the vertical portion of the well. Therefore, the pipe will no longer fall into the well. The model can be used to determine the point at which buckling occurs, and steps can be taken to minimize the effect. Pipe stresses are another major concern in drilling horizontal wells. Cyclic stresses in high dogleg severities can cause drill pipe fatigue. Many times in horizontal wells, the torsional stresses will exceed the stresses caused by axial tension, and therefore must be considered. Methods for determining the maximum allowable pipe stresses are presented. The model can be used to design a well with the maximum amount of horizontal wellbore or to efficiently design a shorter horizontal well. The model calculations can be easily programmed into a hand-held calculator. 7 refs., 8 figs.

35701 (CHOA–8808, pp. 11) **Hydraulic fracturing improves steam placement and oil recovery.** Theriault, D.J. (AEC Oil and Gas Co.); Jenkins, G.R.; Naderi, N. Canadian Heavy Oil Association (Canada). 1988. (CONF-8808237–: Thermal well completions seminar, Edmonton, Canada, 11 Aug 1988;CE–02660). Selective steam placement within the formation and potential production impairment from fines migration are important factors to consider during initial well completion design in cyclic steam stimulation projects. Typically, in thick formations, only the lower portion of the zone is perforated, to minimize the anticipated steam override. This practice may be unfavorable in reservoirs with zones of varying quality or higher water saturation. Additionally, high fluid velocities during steam injection and/or production can mobilize fines and cause near wellbore damage. This paper discusses a completion strategy that improves the injection profile and reduces the potential for fines migration. Initial pilot results, where the Wabiskaw formation was fractured during steam injection, were not sufficient to justify commercial operations. Experimentation with propped fracturing techniques prior to steam injection led to the conclusion that further testing was warranted. Two phases of propped fracture programs have been successful in improving the injection profile, and have achieved a substantial improvement in production response over multiple cycles. Calendar day oil rates have been improved by up to 100%. The program design and operational procedures were

chosen in order to initiate a horizontal fracture; the temperature and pressure data collected after steam injection suggest that this was obtained. 2 refs., 5 figs., 1 tab.

Many papers in this volume deal with the steam stimulation of oil sands deposits in various countries: Canada, USA, Venezuela, Trinidad, Brazil and Kuwait. The underground test facility at Fort McMurray, Alberta, is presented. One case in Venezuela involves steam stimulation of a deposit at 2500m depth. Some research papers deal with reservoir fracturation and subsidence and with the porosity-permeability relationship, in connection with the steam stimulation technique. A few papers deal with hot water stimulation in the Athabasca deposits. Some research papers present laboratory data and models on bitumen detachment and the composition of the tailings in the hot water process. The conditions of granting permits in Alberta and California, the activities of the AOSTRA (Alberta Oil Sands Technology and Research Authority), the stratigraphy of some of the Athabasca deposits, and the economic feasibility of a project in Madagascar are discussed. All twenty-three papers have been abstracted.

35703 (AOSTRA–8808, pp. 6) **The regional upgrader concept for oil sand development. Brief overview.** Yildirim, E. (ARC Oil Sands Task Force, AB, Canada). Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

Sustained development of Alberta's unconventional energy resources cannot be done without serious consideration for processing to upgrade the quality of these heavy hydrocarbon projects. Two current operations, Suncor and syncrude Canada, producing bitumen through surface mining and extraction steps are integrated plants fully equipped with upgrading process units. However, there are no upgraders at the sites of in-situ operations even though the integrated plant configuration is also available in conjunction with these applications. There are other upgrading alternatives to integrated plants, but this paper focuses on the regional upgrader option. The proposed concept involves the establishment of a regional upgrader in Alberta as a common facility for processing bitumen feedstock supplied by a number of mineable oil sands and in-situ production operations. The configuration described involves satellite production facilities on mineable as well as in situ oil sand leases A preliminary evaluation of the proposed concept confirms the viability of the regional upgrader concept in relation to the more conventional integrated plant development approach. Based on supply cost economics, the cost of synthetic crude production would be in the range of $29.11 to $33.66/bbl. The level of precision in the study is adequate to show general trends and conclusions. The supply cost estimates may be conservative and may not reflect achievable potential improvements. Measured strictly by the return as an investment criterion, the construction and operation of an upgrader is not economical under the current oil price scenario. Measured in terms of social benefits, however, the concept offers immense returns to Alberta and Canada. 8 refs., 1 fig.

35704 (AOSTRA–8808, pp. 20) **Syncrude processing in conventional refineries.** Galiasso, R. (INTEVEP, S.A., Caracas, Venezuela); Hallensleben, Y.; Perez, P.; Boltz, K.; Badra, C.; Serpemen, Y. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

A new tool for simulating the operation of conventional refineries with syncrudes was developed. Extensive experimental work was done to develop correlations that could predict the characteristics of the products obtained from hydrotreatment, reforming, catalytic cracking and hydrocracking units with synthetic feedstocks. The results were compared with those obtained from processing typical commercial feedstocks, and the resultant correlations were integrated in a new program, based on the Lotus 1-2-3 spreadsheet package, for the calculation of the price of the syncrude by netback procedure. Results indicate the effects of quality and reactivity on the processes investigated. Aromatics and hydrogen carbon ratios (H/C) seem determinant properties in comparison with those of the reference virgin crude oil. Complex refineries could valorize low quality syncrude if hydrotreatment is available to internally increase the H/C ratio. 10 figs., 10 tabs.

35705 (AOSTRA–8808, pp. 15) **Coking of oil sand, asphaltenes and residual oils in the LR-process.** Weiss, H.; Schmalfeld, J.; Solari, R.B. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

A fundamental conversion principle to shift the hydrogen to carbon ratio in liquid hydrocarbons is carbon rejection or coking. The unique features of the Lurgi-Ruhrgas (LR) flash coking process are presented, and its development status with regard to the coking of oil sand, asphaltenes, and residual oils is described. Several bench and pilot plant tests have recently been performed on various feedstocks including vacuum residue, asphaltenes and coal tar pitch. Some results from these tests are presented. It is felt that inclusion of deasphalting and LR flash coking into a heavy oil refinery complex is an attractive option to enhance product recovery and quality. The processes play an important role in future deep conversion technologies required to balance the increasing gap between demand for light distillates and supply of heavy crude oils in the world market. 8 figs., 3 tabs.

35706 (AOSTRA–8808, pp. 12) **Developments in upgrading of bitumen by hydropyrolysis.** Bunger, J.W. (Univ. ofUtah, Salt Lake City, Utah); Tsai, C.H.; Ryu, H.; Devineni, P. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

Hydropyrolysis, a short residence time, moderate temperature process, has been shown to produce 90+% liquid product yields from feedstocks containing more than 50% nonvolatile materials. The process results in extremely low coke yields. Detailed studies of the chemistry reveal that hydrogen is responsible for the low coke production through hydrogenation reactions, accelerated cracking and dealkylation reactions, and through inhibition of aromatic bimolecular reactions. In the process regime studied, dealkylation reactions, those responsible for cracking of side chains and of ring opening of naphthenoaromatic compounds, are the most rapid. Hydrogen consumption is modes at low gas production levels. A hydrogen balance has been performed as it relates to hydrogenation and dehydrogenation reactions occurring. Results suggest that there may be a limit as to how short a residence time and how high a temperature can be utilized and maintain high liquid

and low gas yields. Preliminary considerations of a commercial sized plant reveal that costs must be minimized to ensure profitability. 16 refs., 5 figs., 2 tabs.

35707 (AOSTRA–8808, pp. 14) **Reservoir plugging/blocking using ultramicrobacteria: Three-dimensional physical simulator results.** Singh, S. (Alberta Research Council, Edmonton, AB, Canada); Nguyen, D.; Grieco, J.; de Rocco, M.; Costerton, B.; Cusack, F.; Lappin-Scott, H. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

Ultramicrobacteria are bacteria which are small enough to permeate through a sand pack. Upon injection of a suitable nutrient, they can be resuscitated to multiply and produce enough polysaccaride slime to cause plugging. This method does not depend on an initial dispersion concentration of the ultramicrobacteria but rather on a well-designed nutrient package. To advance development of bacterial plugging under simulated field conditions, experiments were conducted in a three-dimensional physical simulator. The simulator consisted of a 45cm diameter, 30cm height pressure vessel which was packed with Ottawa sand, to simulate the unconsolidated medium associated with heavy oil and oil sands formations. It was equipped with specially designed injection/production wells and a number of sampling/pressure probes distributed throughout the pack. Following the injection of the ultramicrobacteria and the nutrient solutions, results from pressure drop measurements, on-line sampling and from sessile samples and cores indicated that ultramicrobacteria had penetrated the pack in all directions and that under nutrient stimulation, they had grown/multiplied into colonies. Bacterial polymer polysaccharide was evident throughout and permeabilities had been reduced to a fraction of their original values. 3 refs., 10 figs., 7 tabs.

35708 (AOSTRA–8808, pp. 17) **Analysis and implementation of the steam assisted gravity drainage process at the AOSTRA UTF.** Edmunds, N.R.; Haston, J.A.; Best, D.A. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

The Alberta Oil Sands Technology Research Authority is the operator of the Underground Test Facility (UTF) which has been constructed to enable the testing of mine-assisted in situ recovery processes, using horizontal wells drilled from tunnels below the pay zone. One of the test programs currently underway at the UTF is a six well test of steam assisted gravity drainage (SAGD). The well layout consists of three pairs of horizontal wells. Each well pair has a producer completed 2-3m above the base of the pay and an injector about 5m above the producer. The well pairs are spaced 25m apart and the effective length of each pair is about 60m. This paper concentrates first on the detailed mechanisms of SAGD in an oil sands context including numerical solutions of drainage problems. The engineering considerations involved with implementing the conceptual process in field hardware are also discussed. Steam assisted gravity drainage can be understood in terms of two distinct modes, namely ceiling and slope drainage. Ceiling drainage is controlled by countercurrent transport in the steam zone immediately below the front, whereas slope drainage is controlled by bitumen transport just ahead of the front. This in turn depends on conduction heating. Ability to predict UTF drainage rates is severely limited by the random, numerous, and small scale heterogeneities present in the McMurray formation. The test program was therefore designed to directly gather data on drainage rates. Considerable development of complementary technology, particularly drilling and completions, was necessary to implement the test. To date the field results have been more than satisfactory, and it appears that the test program will achieve its objectives. 13 refs., 12 figs., 2 tabs.

35709 (AOSTRA–8808, pp. 28) **A theoretical and experimental study of steam-assisted gravity drainage process.** Chung, K.H. (Univ. of Calgary, Calgary, AB, Canada); Butler, R.M. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

New experimental results are reported on physical model studies of the steam-assisted gravity drainage (SAGD) process for recovery of heavy oil from tar sands. Two similar physical models were constructed: one operating near atmospheric pressure and one at pressures up to 3.55 megapascals. The model used a preheated vertical steam injector which was perforated near the top of the formation and a horizontal producer at the base of the formation. The model packing was chosen to provide dimensional similarity with specific field conditions. The experimental results were in general agreement with those predicted by an extended version of an existing theory. The scaling procedure used for the SAGD process was found to be satisfactory in predicting the experimental performance at various operating conditions. The viability of using a preheated vertical injector to establish initial communication between the injection and production wells was illustrated experimentally. A closer spacing between the horizontal wells improves the efficiency of the SAGD process. The ultimate recovery is independent of the well spacings. 9 refs., 21 figs., 5 tabs.

35710 (AOSTRA–8808, pp. 13) **Optimum cementing and gravel packing methods for unconsolidated heavy oil sands.** Machado, P. (Petroleos de Venezuela, SA); Moya, J.; Figueredo, C. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

A review is presented of existing practices and improvements implemented for primary cementing and gravel packing techniques applied in the Hamaca Area of the Orinoco Heavy Oilfield. Actual completion techniques employed are shown to be acceptable. However, state of the art procedures have motivated several improvements that have insured technically successful results for both cementing and gravel packing operations. Present development includes vertical and directional wells, completed either with inside or open-hole gravel packs. Cementing operations are achieved by using a thixotropic slurry which is pumped at high rates. A variation of additives is employed to control cement properties. Silica flour in the cement slurry is used and casing prestressing has been applied in anticipation of thermal stresses. Failures in sand control have been observed after cyclic steaming. The main causes for sanding seem to be failures at the linear hanger device and limited quality of available gravel. After extensive analyses, conclusions indicate that cement slurries should be displaced in the plug flow regime, with strict control of chemical additives. Consideration of casing behavior under thermal stresses indicates that prestressing is unnecessary. Changing the sand control adapter for a metal to metal type and better control of the steam's pH should improve the performance from completed wells. 24 refs., 5 figs., 3 tabs.

35711 (AOSTRA–8808, pp. 14) **A pressure observation well for monitoring and optimizing the pressure-up blowdown combustion process.** McGee, B.C.W. (BP Resources Canada Ltd., Calgary, AB, Canada); Hallam, R.J.; Nzekwu, B.I.; Galas, C.M.F. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

The Alberta Oil Sands Technology and Research Authority has been developing the patented Pressure-Up Blowdown combustion process, as a follow up to cyclic steam stimulation, in a pilot on the Wolf Lake lease. During the pressure-up phase, oxygen for in-situ combustion and water are injected into the reservoir, while the surrounding producers are controlled to distribute the heat and to increase the reservoir pressure within the channel system. Oxygen injection is terminated to initiate the blowdown phase, and the producers are operated without restriction to depressure the reservoir. The pressure-up blowdown sequence is then repeated a number of times. To monitor the development of the steam and combustion zones within the reservoir a number of observation wells have been used in the pilot. One of these wells was a pressure observation well, intentionally drilled into the cold part of the oil sand reservoir, away from the depleted, heated channels, to monitor the pressure response characteristics of the reservoir. The data collected from the pressure observation well have been used to interpret: the direction of fluid flow in the reservoir during the oxygen and water injection phases; the volume of oxygen required to pressure-up the reservoir; and the effective transmissibility of the formation during the presure-up and blowdown phases. Analysis of the data has shown that the extent of invasion of the colder regions of the reservoir, by the steam formed from the heat scavenging water, is dependent on the operating strategy. To achieve efficient heat transfer either multiple, small oxygen-water slugs or the coinjection of water and oxygen is required. The paper also compares the field data to numerical simulation used to support the interpretation of the process. 7 refs., 12 figs.

35712 (AOSTRA–8808, pp. 14) **Use of small scale ART processing for wellhead viscosity reduction and upgrading of heavy oils.** Dennis, G.E. (Engelhard Corp., N.J., USA). Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

Heavy crude oils usually require heat for production and diluent for transport. These two major components of operating cost can be substantially reduced through the application of Engelhard's ART process at the wellhead. ART is a commercial, short contact time carbon refection process which produces high yields of upgraded crude having reduced gravity and viscosity. From the low value, asphaltenic portion of the crude, ART generates surplus recoverable energy as fuel gas and steam. The need for transport diluent is eliminated while meeting 25 to 40% of the crude oil production steam requirements. The ART process offers a minimum cost means of primary upgrading via multiple small-scale modular units. The crude product can be blended into suitable refinery crude slates for finishing. This paper provides case study information on the cost and performance of the wellhead ART facility processing Cold Lake bitumen and attempts to bracket the upgraded crude value which could be realized. The cost of ART processing a barrel of bitumen is compared to the value added to this barrel of bitumen by ART processing. 5 refs., 6 figs., 8 tabs.

35713 (AOSTRA–8808, pp. 8) **Mild thermal conversion of Cold Lake bitumen.** Sankey, B.M. (Esso Resources Canada Ltd., Calgary, AB, Canada); Wu, F.S. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

In order to enable pipeline transportation of Cold Lake bitumen and similar heavy crudes, current practice is to add a light diluent such as naphtha. As bitumen production increases, there is no guarantee that diluent supply will keep pace. Consequently, alternative means of viscosity reduction are required. One of these, namely mild thermal conversion (MTC), has been investigated in laboratory, pilot plant, and engineering studies. Any processing of bitumen introduces chemical changes and these can affect product quality. Information is presented on properties of the various product fractions from MTC, including asphalt, often a key product from Cold Lake bitumen. For the refiner using bitumen as feed to a conversion unit, the perspective is somewhat different since MTC simply represents a point on the path to complete bottoms conversion. Implications for this situation are also discussed. The degree of diluent reduction can be altered by adjusting the processing severity of MTC, which in turn affects the product quality. The relationship of these together with the relevant engineering issues are described. Capital and operating costs plus other socioeconomic factors are presented for MTC along with economic benefits. It is concluded that MTC can provide a viable means of reducing dependence on diluent supply when moving bitumen from production site to market. While benefiting from similar existing commercial experience, the MTC process incorporates new findings which show that historic quality concerns about thermally converted products can be managed by appropriate design, and optimization of process/quality factors. 8 refs., 3 figs., 6 tabs.

35714 (AOSTRA–8808, pp. 14) **Oil sands formation preheating study.** Farouq Ali, S.M. (Univ. of Alberta, Edmonton, AB, Canada); Verma, A. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

Canada's oil sands in the McMurray and Wabiskaw formations of the Athabasca deposits are immobile at their native reservoir temperatures. However, if the reservoir temperature is increased the viscosity drops and the oil becomes mobile. Various methods of formation heating were investigated for both the McMurray and the Wabiskaw formations. Numerical simulations were carried out to determine the effectiveness of formation heating by cyclic steam stimulation, steam injection followed by a long soak period, steam injection at a high rate over a limited interval, and in-situ combustion over a limited interval, followed by a shut-in period. It was found that cyclic steam stimulation was more effective than the other methods for formation heating. Steam injection followed by a long soak period was only marginally more effective in expanding the heated zone. However, it had the disadvantage that no oil was produced during the long soak period, unlike cyclic steam stimulation. Steam injection over a limited interval at a high rate could not be achieved in the case of McMurray and in-situ combustion resulted in uneven heating. It was concluded that cyclic steaming offered the best economic prospect for preheating the formation. 1 ref., 12 figs.

35715 (AOSTRA–8808, pp. 27) **Optimization of heavy oil thermorecovery made possible with a novel in-situ process.** Toma, P. (Alberta Research Council, Edmonton, AB, Canada); Reitman, V.; Redford, D. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

In order to improve the distribution of hot fluids injected in a heavy or extra-heavy oil reservoir and to control the development of production using a drive process, an array of horizontal sand-filled channels connecting a pattern of vertical wells was suggested. A sensitivity study aimed at determining the effect of the geometry and permeability of the sand-filled channels on the steamdrive recovery process is presented. The study, using numerical simulation, indicates that the optimum permeability for the sand-filled channels depends mainly on the permeability and viscosity of the oil sand formation. Avoiding the occurrence of channel plugging subsequent to the start-up of steam injection represented another essential constraint for designing the recovery process. Net economic and recovery process advantages were obtained when several levels of

channels were used rather than a single level, particularly for low permeability or high layered reservoirs. 34 refs., 18 figs.

35716 (AOSTRA–8808, pp. 14) **Insolation and characterization of non-bituminous organic materials which may interfere with recovery of bitumen from oil sands.** Sengupta, S. (Univ. of Calgary, Calgary, AB, Canada); Hall, E.S.; Tollefson, E.L. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02589). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sand, vol. 1.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

Organic material, referred to in this paper as non-bituminous combustibles, concentrates in the centrifugation plant tailings from the hot water process and is not soluble in the normal solvents that are used to dissolve bitumen, such as toluene or chloroform. The presence of this material may contribute to losses of bitumen and naphtha to tailings. This paper describes the effects of sequestering agents on the flotation and gravity separation processes that have been employed to isolate the non-bituminous organic materials. The observed effects of sequestering agents have been used to develop a conceptual model of the interactions between bitumens, minerals, and the insoluble non-bituminous materials. Analytical and spectroscopic techniques indicate that the insoluble organic materials isolated have low ash but high oxygen contents. The sulfur content is less than that of bitumen. The thermal content is comparable to that of lignite coal. 37 refs., 6 figs., 5 tabs.

35717 (AOSTRA–8808, pp. 6) **Athabasca mineable oil sands. The RTR/Gulf extraction process theoretical model of bitumen detachment.** Corti, A. (RTR Oil Sands Ltd., Calgary, AB, Canada); Dente, M. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02589). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sand, vol. 1.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

In 1979, RTR operated a large pilot plant (20 ton/h) for bitumen extraction from the Athabasca oil sands. A modified hot water process was tested. On the basis of the experimental results, a simplified theoretical model for bitumen detachment from the sand grains was proposed. Three main equations describe the model in terms of bitumen detachment velocity, bitumen droplet size, and amount of connate water remaining with the bitumen. From the characteristics of the model, the analyses, and experimental observations, it is concluded that the oil sand is a complex system that presents an internal natural velocity for the bitumen detachment. The best results are obtained when the external process conditions and the internal surface energies are properly balanced. The gentle conditioning developed and proposed for the RTR/Gulf Extraction Process is one way of satisfying this requirement. 4 refs., 3 figs., 3 tabs.

35718 (AOSTRA–8808, pp. 10) **Selection and evaluation of diluents in the modified hot water process.** Yang, Y.J. (Univ. of Utah, Salt Lake City, Utah, USA); Bukka, K.; Miller, J.D. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02589). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sand, vol. 1.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

The modified hot water separation process, developed at the University of Utah, has been found to be applicable to U.S. tar sands of low and medium viscosity bitumen (1-50 pascal-records at 50^{0}C). But when applied to tar sands containing very high viscosity bitumen (1500 pascal-records at 50^{0}C), the same level of success was not achieved. The principal difference in the modified hot water process is the control of bitumen viscosity by the addition of diluent to the tar sands. Earlier studies have shown that improved separation coefficients can be achieved by proportioning the addition of diluent to the tar sands in a manner such that the bitumen viscosity in the source material falls to a value in the range of 0.5-1.5 pascal-records. Kerosene has been the choice dilent used in the studies so far. This paper attempts to optimize the viscosity reduction of the bitmen in tar sands by varying the nature of the solvent. Industrial solvents such as kKerosene, SC-2, SC-150, cyclohexane, and ethyleneglycol-di-butylether have been used and the bitumen samples are derived from Utah Sunnyside, P.R. Spring, and Asphalt Ridge, which are representatives of low and very high viscosity bitumens. Viscosity measurements as a function of temperature have been achieved on the bitumens with the diluents. It was found that SC-150 is the most efficient in reducing the viscosity of bitumen. In order to verify these conclusions, two diluents, kerosene and SC-150, were used in the hot water processing of Sunnyside tar sands. 13 refs., 3 figs., 8 tabs.

35719 (AOSTRA–8808, pp. 5) **In defense of the Clark hot water process.** Rose, D.E. (Dereng Enterprises Ltd., AB, Canada). Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02589). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sand, vol. 1.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

Commercial production of bitumen from surface operations in the Athabasca Oil Sands region has utilized the Clark Hot Water Process since startup in 1967. From a materials handling and process efficiency standpoint, the process has proven successful. A large amount of engineering effort has been devoted to its development and improvement; much of the technology is directly applicable to alternative processes and other industries. Despite successful operation, many areas within the extraction operation have proven troublesome since startup, and will be faced in one form or another by future operators, even if an alternative process is utilized. A strategy supported by both government and industry should be developed to direct greater research and engineering effort toward resolution of these problems. 10 refs., 3 figs.

35720 (AOSTRA–8808, pp. 18) **Geotechnical instrument tation of the AOSTRA mine-assisted underground steaming trial.** Laing, J.M. (Thurber Consultants Ltd., Edmonton, AB, Canada); Scott, J.D.; Stokes, A.W.; Suggett, J.C.; Wood, D.F. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02589). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sand, vol. 1.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

The Alberta Oil Sands Technology and Research Authority (AOSTRA) Underground Test Facility (UTF) located near Fort McMurray, Alberta, is currently being used to test the shaft and tunnel access concept for bitumen recovery. The project consists of tunnels that have been developed at a depth of 178m in the Devonian Formation limestones immediately beneath the oil sands to allow a trial of steam assisted gravity drainage recovery of bitumen from overlying oil sands. Trial steaming began in late 1987 and the first phase is planned to continue until early 1989. Seven participants have joined AOSTRA in funding the first phase tests. Under the co-sponsorship of AOSTRA and CANMET (Canada Centre for Mineral and Energy Technology), an extensive program of geotechnical instrumentation has been installed to monitor the response of the ground to the steaming operations. Instruments installed from underground are meant to ensure the integrity of the underground openings and wells, whereas those installed from the surface are to assess the geotechnical response of the reservoirs to the recovery process. The instruments that have been installed comprise thermocouples, thermistors, piezometers, extensometers, horizontal deflection monitoring wells, and tunnel convergence arrays. Readings obtained have generally indicated excellent instrument performance. In future, the monitoring is intended to provide previously unavailable data on the response of a formation throughout the development of

a steam zone; it is to be supplemented by numerical modelling and laboratory testing of core samples. 5 refs., 16 figs.

35721 (AOSTRA–8808, pp. 16) **AOSTRA underground test facility: mining access for research and production.** Haston, J.A. (Northwest Mine Services Ltd., Calgary, AB, Canada); O'Rourke, J.C.; Kovalsky, J.A.; Luhning, R.W; Greenwell, J; Bohme, C.G. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02589). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sand, vol. 1.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

The Underground Test Facility (UTF) project, located north of Fort McMurray, Alberta, Canada, has been initiated by the Alberta Oil Sands Technology and Research Authority to investigate markedly new approaches to in situ recovery from Athabasca. Now well established in its process testing stage, the project is based on thermal process applications implemented through horizontal wells placed in the oil sands from an underlying tunnel system. This paper discusses the project site, project facilities, mining and drilling, underground process operations, safety, and costs. The initial results have been very encouraging. The UTF project aims at overcoming the basic problems of interwell communications development and maintenance. Studies have shown that the UTF processes offer the prospect of excellent oil/steam ratios with acceptable production rates, plus the promise of high ultimate recovery. More detailed discussion of the process piloting and of related programs is given in companion papers. 11 refs., 9 figs.

35722 (CHOA–8808) **Thermal well completions seminar.** Theriault, D.J. (ed.). Canadian Heavy Oil Association (Canada). 1988. vp. (CONF-8808237–: Thermal well completions seminar, Edmonton, Canada, 11 Aug 1988;CE–02660). Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $N/C.

Papers presented at this seminar cover subjects associated with thermal oil recovery, especially heavy oil recovery. Techniques for well completion, steam stimulation, and reservoir fracturing are presented. Oil recovery may also be optimized by drilling radial horizontal holes with new equipment. Geotextile filters for sand control, new steels that resist thermal fatigue and hydrogen sulfide corrosion, premium casing connections, the use of thermally insulated well casings, and a new model of beam pump are also discussed. Separate abstracts have been prepared for 11 papers from this seminar.

35723 (CHOA–8808, pp. 14) **New developments in beam pumping technology PC 3000.** Cockshutt, D. (Alberta Energy Co., AB, Canada); Thomas, W. Canadian Heavy Oil Association (Canada). 1988. (CONF-8808237–: Thermal well completions seminar, Edmonton, Canada, 11 Aug 1988;CE–02660). In *Thermal well completions seminar.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $N/C.

This paper describes the technical analysis of a new type of beam unit that does not use a crank and pitman arm drive configuration, but a power cylinder and tension belt system to provide pump motion suitable for heavy oil production. A theoretical analysis of the new beam unit substantiated the manufacturer's performance claims. Benefits of the new unit include increased production, fewer operational difficulties, and less operator input. For a given pumping speed, horsepower requirements are 2/3 less. Full control over the imposed rod motion will furthermore allow reductions in rod stress for a given pumping speed. Gear box torque overloading problems are completely avoided by not using rotary crank counterbalancing. The electronic control system of the pump is explained. 7 refs., 7 figs., 2 tabs.

35724 (CHOA–8808, pp. 11) **Mobil Oil Canada's use of insulated tubulars in thermal projects.** Kutzak, A.R. (Mobil Oil Canada Ltd., Canada); Gunn, D.W. Canadian Heavy Oil Association (Canada). 1988. (CONF-8808237–: Thermal well completions seminar, Edmonton, Canada, 11 Aug 1988;CE–02660). In *Thermal well completions seminar.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $N/C.

Mobil Oil Canada Ltd. has a number of steam projects in its Canadian heavy oil properties. In order to optimize the overall economic performance and cost of these projects, various well completion designs, including insulated tubing, have been utilized. This paper discusses some factors that were assessed prior to deciding on the use of commercially available insulated tubulars, and Mobil's experience to date with these tubulars. Major factors considered included thermal energy losses through the wellbore and extended well life. Furthermore, physical characteristics of insulated tubing, including collar life and insulation degradation, required evaluation. Overall project economics embodied these parameters. The conclusions of the paper are the following: insulated tubulars are useful in steam injection service, but the benefits must offset both the original purchase cost and the servicing costs; insulated tubing reduces the possibility of casing failure due to thermally induced stresses; well designed completions result in maximum benefit from insulated tubing; new insulation systems permit designing for longer insulated tubing life, especially in H_2S environments; determination of operational requirements before ordering insulated tubing provides correct design; and adequate inspection in the manufacture of the thermal tubing ensures that all aspects meet design criteria. Although Mobil has continued to use bare tubing and bare tubing-packer type completion designs, their consideration of the above and other pertinent factors has led to the frequent use of insulated tubulars. Current plans call for the continued use and testing of these tubulars, along with future field testing of completion variations designed to reduce overall operating costs. 7 refs., 5 figs.

35725 (CU/FCE–8903, pp. 16) **In situ oil sands temperature logging.** Leshchyshyn, T. (Petro-Canada Inc., Canada); Seyer, W. Calgary Univ., AB (Canada). Faculty of Continuing Education. 1989. (CONF-8903126–: 6. annual heavy oil and oil sands technical symposium, Calgary, Canada, 8 Mar 1989;CE–02591). In *Challenges and innovations 1989. 6th Annual heavy oil and oil sands technical sypmposium.* Available from CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $3.40 CAN minimum, plus $0.25/p after 10 pages.

Temperature logging has been used extensively for in-situ oil sands operations to determine the vertical heat zone profile and the maximum temperature during cyclic steam production. Recurring inconsistencies from temperature logging at three single well cyclic steam tests in the McMurray oil sands initiated an investigation into the problems of temperature logging and the selection of possible solutions. The standard temperature logging techniques previously used were critically analyzed to determine the physical problems which can lead to erroneous results. Tool design, mainly the inability of the temperature probe to stabilize quickly, appeared to be the major reason cited for unreliable readings. The tool was modified and new data were obtained, showing much improved consistency. A practical stationary logging procedure was developed to identify potential temperature logging problems. 4 refs., 5 figs., 1 tab.

35726 (CU/FCE–8903, pp. 31) **Prevention of formation damage through injection and production practices in heavy oil reservoirs.** Coskuner, G. (Petroleum Recovery Inst., Canada); Maini, B.; George, A.E. Calgary Univ., AB (Canada). Faculty of Continuing Education. 1989. (CONF-8903126–: 6. annual heavy oil and oil sands technical symposium, Calgary, Canada, 8 Mar 1989;CE–02591). In *Challenges and innovations 1989. 6th Annual heavy oil and oil sands technical sypmposium.* Available from CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $3.40 CAN minimum, plus $0.25/p after 10 pages.

Most heavy oil reservoirs are situated in unconsolidated formations. These types of formations are sensitive to changes in in-situ stresses at the reservoir. That is, they expand greatly as the net confining pressure is decreased and this may cause changes in the properties of the formation. Formation damage is a frequently encountered phenomenon in heavy oil reservoirs. This paper describes the effect of net confining pressure on mechanical fines migration. Experiments show that the critical velocity at which fines start to disperse and permeability starts to decline decreases with increasing net confining pressure. Results are analyzed in the light of the fact

that the net confining pressure changes during injection and production. Furthermore, recommendations are made to minimize the rate damage during the field operations. 17 refs., 12 figs., 2 tabs.

35727 (CU/FCE–8903, pp. 24) **The Husky bi-provincial upgrader design basis.** Chase, S. (Husky Oil Operations Ltd.). Calgary Univ., AB (Canada). Faculty of Continuing Education. 1989. (CONF-8903126–: 6. annual heavy oil and oil sands technical symposium, Calgary, Canada, 8 Mar 1989;CE–02591). In *Challenges and innovations 1989. 6th Annual heavy oil and oil sands technical symposium.* Available from CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $3.40 CAN minimum, plus $0.25/p after 10 pages.

The bi-provincial upgrader complex is designed to produce 46,000 barrels per calendar day (BPCD) of synthetic crude and 8,000 BPCD of asphalt from 54,000 BPCD of a 65/35 volumetric blend of Lloydminster and Cold Lake heavy oils. The complex will consist of the existing Lloydminster refinery and the upgrader facility. The upgrader facility is a grassroots installation that will be located in Saskatchewan about 8 km from the existing refinery. The existing refinery is a 25,000 BPCD unit whose primary function is to produce asphalt from heavy oil. This refinery will continue to produce asphalt, naphtha (which is recycled to the production fields for use as a diluent) and a combined gas-oil stream. This gas-oil stream will by hydrotreated in the upgrader. In this paper, the process configuration and some of the more important considerations in the process design of the complex are reviewed. Also discussed are the properties of the heavy crude oil feedstocks, the primary synthetic crude quality targets, and the selection of the H-OIL process as the primary upgrading technology. The flowsheet of the process is presented: the primary upgrading plant (H-OIL unit, delayed coker, and gas recovery unit), the secondary upgrading (gas-oil hydrotreater, and naphtha jet hydrotreater), the hydrogen plant, the sulfur recovery plant, and the support systems. 2 figs., 4 tabs.

35728 (CU/FCE–8903, pp. 15) **The newGrade upgrader.** Court, A.L. (NewGrade Energy Inc., Canada); Smith, W.H. Calgary Univ., AB (Canada). Faculty of Continuing Education. 1989. (CONF-8903126–: 6. annual heavy oil and oil sands technical symposium, Calgary, Canada, 8 Mar 1989;CE–02591). In *Challenges and innovations 1989. 6th Annual heavy oil and oil sands technical symposium.* Available from CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $3.40 CAN minimum, plus $0.25/p after 10 pages.

In 1983, Consumers Co-operative Refineries Limited (CCRL), with the governments of Saskatchewan and Canada, undertook a study to establish the viability of upgrading Saskatchewan's large reserves of heavy oil, using CCRL's existing Regina refinery as a starting point. The decision to proceed with the design and construction of the facility was made in late 1985; field construction started in October 1986, and the complex processed its first heavy oil in November 1988. Process selection, hydrogen supply, and sulfur recovery are discussed. The final integrated refinery/upgrader complex has the capability to process 50,000 bbl/d of Lloydminster/Fosterton type crudes to produce a full range of petroleum fuel products and to blend a competitive synthetic crude oil for pipeline delivery. Engineering, procurement, and construction, all under a managing contractor, are discussed. It was decided that the new facility would be turned over from construction by systems. There have been a reasonable number of mechanical problems, most related to inadequate winterization. The project was completed on-schedule and on-budget in October 1988 for $700 M. The complex is now running completely on heavy crude oils at 80% of its design capacity and is expected to reach full capacity in the latter months of 1989. 1 fig., 1 tab

35729 (CU/FCE–8903, pp. 12) **OSLO project update and upgrader technology selection.** Dowdle, L.D. (Esso Resources Canada Ltd., Canada). Calgary Univ., AB (Canada). Faculty of Continuing Education. 1989. (CONF-8903126–: 6. annual heavy oil and oil sands technical symposium, Calgary, Canada, 8 Mar 1989;CE–02591). In *Challenges and innovations 1989. 6th Annual heavy oil and oil sands technical symposium.* Available from CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $3.40 CAN minimum, plus $0.25/p after 10 pages.

OSLO in an acronym for "other six leases operation", a six company joint venture formed in 1981 to explore for and develop oil sands resources on six leases in the Athabasca region of Alberta. Since its formation, OSLO has spent over $30 M on resource evaluation programs and a wide variety of studies. The search for resources has led to two very large, high quality bitumen ore bodies. Since 1985, the OSLO owners have focussed their efforts on the more favorable of the two, which has over 3 G bbl of high quality surface mineable bitumen. The development option selected has been a fully integrated 12,000 m^3 per calendar day synthetic crude oil project. The choice of the project size and configuration and its schedule are briefly discussed. The upgrading processing scheme represents one of the most complex components in a tar sands recovery plant. The two major steps are primary upgrading (conversion of the large bitumen molecules into smaller ones) and secondary upgrading (hydrotreating to remove sulfur and nitrogen). The choice of a preferred technology is briefly discussed, including the definition of the project issues, the evaluation of available technologies (in particular, their environmental impacts), licensor business proposals, economics, and risk assessment. 5 figs.

35730 (RPC–420301) **Modifications of existing testing facilities, optimization of hydroretorting conditions, and assessment of Canadian oil shales as source of synthetic fuels. Final report.** Research and Productivity Council, NB (Canada). 1983. 140p. (MICROLOG–89-01951). Available from Canada Centre for Mineral and Energy Technology, Technical Information Division, 555 Booth St., Rm. 342, Ottawa, ON, Canada K1A 0G1; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

A test facility previously developed at the Research and Productivity Council (RPC) of Canada for retorting oil shales under hydrogen pressures was modified to improve oil recoveries. The hydroretorting conditions were optimized at 500 psi hydrogen, 700^{0}C, and 8^{0}C/min heat-up rate using a Kentucky oil shale sample previously evaluated at the Institute of Gas Technology (IGT), Chicago, Illinois. Oil quantities recovered from the RPC facility were comparable to results from IGT. The optimized conditions for the Kentucky oil shale were used to evaluate a total of 37 oil shale samples from New Brunswick, Ontario, Nova Scotia, Newfoundland, British Columbia, and Quebec. Hydrogen retorting increased the oil yields from 6% to greater than 150% over Fischer assay. Organic conversion rates were also increased under hydrogen retorting for all shale samples tested. The highest grades of oil shale tested were from Albert County, New Brunswick. The average oil yields for five New Brunswick samples increased from 20.0 gal/ton for nitrogen retorting to 38.4 gal/ton for hydroretorting. 3 refs., 63 figs., 13 tabs.

35731 (UCID–16986-89-1) **Lawrence Livermore National Laboratory oil shale quarterly report, January–March 1989.** Cena, R.J. (ed.). Lawrence Livermore National Lab., CA (USA). May 1989. 12p. Sponsored by DOE Fossil Energy. DOE Contract W-7405-ENG-48. Order Number DE89014301/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Obtaining accurate kinetics of oil generation and associated oil degradation reactions is an important part of understanding and improving oil shale pyrolysis processes. While programmed micropyrolysis at several heating rates offers one method for measuring chemical kinetics data, an alternative that is rapid and potentially more accurate (e.g., in relating the kinetics to a specific temperature or temperature range) is the use of an isothermal fluidized bed. A principal hindrance in interpreting fluidized-bed data is that the signal being measured can undergo significant delay and dispersion from the time it is generated until it reaches the detector. The measured reaction rate can be significantly different from the true rate. Meaningless kinetic parameters can be obtained by ignoring those differences. A tracer signal measured under the same conditions will help quantify the dispersion. We have modified our kinetic analysis program, KINETICS, to make use of tracer data by means of the latter procedure. 2 refs., 6 figs., 2 tabs.

Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

Radiographic tecniques are used to identify physical core characteristics before the core is slabbed and/or sampled. In the case of a tar sand well, it is most important to locate the low density reservoir sand (consolidated or unconsolidated) and the higher density, potential permeability barriers such as shale, siltstone and tight sandstone, since it is the nature, thickness and distribution of these various components which can dictate whether a well is suitable for production. This paper describes a method by which a tar sand core can be interpreted using X-radiography, and outlines the advantages of X-raying a total well. 7 refs., 6 tabs.

The presence of humic matter modifies the hydrophilic character of some oil sands solids surfaces and thereby results in serious problems in bitumen recovery using water based processes. In this work, the fraction enriched with humic matter was separated from the bulk of Utah oil sand solids, using the cold water agitation test, and characterized by different techniques. The results obtained were discussed in comparison with those for Athabasca samples of different geological origin. By means of solid state ^{13}C NMR, it was demonstrated that the humic matter present in the separated solids is predominantly aliphatic in nature, with the aromaticity much lower, compared to that for Athabasca humic matter. These results suggest that in the case of Utah samples terrestrial input into the formation of humic material is not as significant as it is for Athabasca oil sands. The main inorganic components of the solids separated from Utah oil sand were iron-bearing x-ray amorphous material (possibly iron oxide), and also calcite and dolomite. The distribution of organic and carbonate as well as amorphous matter among size fractions derived from Utah fine (fraction $<38\ \mu$), both before and after the cold water agitation test treatment, were studied. It is suggested that, similar to Athabasca oil sands, humic matter in Utah samples occurs in association with x-ray amorphous inorganic components. As in the case of Athabasca samples of marine origin, these organic rich solids are important in the formation and stabilization of hydrophobic globules that have high affinity to bitumen and therefore adversely affect bitumen separability. 31 refs., 4 figs., 5 tabs.

(Petroleos de Venezuela S.A., Caracas, Venezuela); Sanchez, M. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02589). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sand, vol. 1.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

The Orinoco heavy oil sands are at a relative shallow depth of less than 1500m. Since the porosity of these oil sands is in the 30 to 42% range and because they are compressible, it is expected that, due to oil production, the sands are susceptible to compaction, therefore inducing a beneficial production mechanism. Nevertheless, this could cause undesirable surface subsidence. As a result, a concerted effort has been made to determine the geomechanical properties (uniaxial compressibility, stress history, and permeability) of a large number of samples from the Zuata, Hamaca, and Cerro Negro areas. Overconsolidation ratio and vertical strain corresponding to the vertical effective stress are identified as being good indicators of disturbance. If the data from disturbed samples are discarded, then it is possible to evaluate uniaxial compressibilities that define a characteristic behavior for the whole region. The rate of compaction should be low in the initial stages of production in the area. The absolute permeability-porosity relationship based on core samples of the unconsolidated sands is also characteristic over the region. This has been described by a quadratic semi-logarithmic relation. Since the porosities of the samples do not truly represent the in situ values, a methodology is required to integrate core permeability-porosity measurements in the laboratory with in situ porosities. 6 refs., 7 figs., 1 tab.

Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02589). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sand, vol. 1.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

The constitutive model of soils being developed in this paper is based on a precise statement of the behavior of clastic assemblies. Strain-induced anistropy is accommodated by a statement of current fabric and an evolutionary law that stipulates how this fabric evolves. Pore pressure distribution, dilative behavior, and effects on stress states require appropriate boundary conditions, changes thereto, and material laws. In particular, this paper seeks to elucidate the fabric-permeability-dilation relationships and their effect on mechanical behavior as explicit functions of stress state and strain history. Initial conditions required include the current fabric state tensor and the stress tensor for particular field cases. A constitutive statement for oil sands can be derived by laboratory tests, as oil sands can be considered homogeneous and without discontinuities. Data on water permeability as related to shear distortion and dilation are required, as this controls pore pressure evolution in situ. The difficulty in obtaining truly undisturbed specimens remains a barrier to these tasks, but improvements are being made. Field verification is necessary to test predictions and map deviations from predictions. Monitoring must go beyond pressure-volume-temperature measurements. 15 refs., 12 figs.

35736 (CU/FCE–8903, pp. 10) **Jet cracking. A novel coke free visbreaking process.** Chakma, A. (Univ. of Calgary, Calgary, AB, Canada); Chornet, E.; Overend, R.P.; Dawson, W.H. Calgary Univ., AB (Canada). Faculty of Continuing Education. 1989. (CONF-8903126–: 6. annual heavy oil and oil sands technical symposium, Calgary, Canada, 8 Mar 1989;CE–02591). In *Challenges and innovations 1989. 6th Annual heavy oil and oil sands technical symposium.* Available from CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $3.40 CAN minimum, plus $0.25/p after 10 pages.

A novel visbreaking process suitable for viscosity reduction of Alberta bitumens is described. This process uses a high shear jet reactor consisting of a high pressure stainless steel vessel equipped with a specially designed pressure nozzle and is based on the concept of destruction of the micellar structure of asphaltenes, which are responsible for the high viscosity of Alberta bitumens. This destruction is carried out by imparting high shear forces in the presence of thermal disorder. Hot H_2 or N_2 and Athabasca Coker Feed Bitumen were passed through a specially designed mixture and nozzle set-up, simultaneously. Due to the high shear imparted to the bitumen during its passage through the nozzle, asphaltene aggregates were broken. In addition, very fine bitumen droplets were produced, which resulted in intimate mixing of the gas and the liquid. Bitumen viscosity was reduced from 70,000 centipoises measured at 20^0C to below 200 centipoises under mild operating conditions, i.e. 3.5 megapascals at 420^0C. Due to very short residence time inside the reactor, coke formation was almost entirely

avoided. The attractive features of this process are as follows: no catalyst requirement, low pressure operation, little coke formation, and a compact, single reactor suitable for field operation. A patent application has now been filed for this process. 2 refs., 1 fig., 1 tab.

35737 (AOSTRA–8808, pp. 7) **Positive effects of the bemolanga tar sands exploitation.** Ratsimandresy, R. (Office Militaire National pour les Industries Strategigues (OMNIS), Antananarivo, Madagascar); Raveloson, E.; Rako-Andriantsilavo, M.D. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02589). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sand, vol. 1.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

Madagascar has been until now an oil importing country. To address this situation, the Malagasy Government intends to exploit the Bemolanga Tar Sands, which could contribute to the economic development of the country and to its energy self-sufficiency. The importation of petroleum products is a great burden on the country's budget, and the substitution of those products with the synthetic crude from tar sand would allow savings of foreign currency. In order to appraise the opportunity of the exploitation of the Bemolanga Tar Sands, this paper deals with the situation of needs in petroleum products and the economic effects expected from the tar sands exploitation. The realization of the project presents some restrictions. At the production unit level, the high investments influence considerably the financial profitability of the project. To make the project acceptable, the cost price of synthetic crude produced should be about $17 US per barrel and its selling price between $22 and $25 US per barrel. At the national economy level, with the production price up to $25 US per barrel, including 15% of financial interest, the project is still profitable for Madagasgar because it contributes to the country's economic growth, but beyond this price, it would be a great charge for the consumers. According to the rate of return and expected economic effects, the Bemolanga Tar Sand exploitation can be considered an economically viable project. 5 refs., 7 tabs.

35738 (AOSTRA–8808, pp. 16) **The development of shear strength in sludge/clay shale mixes for oil sands tailings disposal.** Dusseault, M.B (Univ. of Waterloo, Waterloo, ON, Canada); Scott, J.D.; Ash, P.O. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

The availability of overburden, mature sludge, and sand in open pit oil sand mining operations opens novel options for permanent waste disposal, yielding a material that is more easily reclaimed. In the Athabasca Deposit, where oil is extracted using hot-water processes, tailings are pipelined to ponds where 50% of the fines flow into the pond and consolidate into mature sludge, ca 35% solids by weight. This consolidates so slowly that it will have to reside permanently in ponds. Overburden is mainly overconsolidated smectitic clay shale with a large suction potential. Combining these materials may eliminate liquid wastes and facilitate reclamation, and there are other possible benefits in transportation. Test programs addressed moisture transfer rates from sludge to overconsolidated clay shale, effects of salinity and solids content on water transfer, and undrained strength of shale-sludge mixes. Laboratory blended waste strength seems adequate for stacking and reclamation, and water transfer is slow enough that slurry pipelining may be viable. It is concluded that addition of low moisture content fines can mitigate hot water extraction waste problems. 26 refs., 14 figs., 4 tabs.

35739 (AOSTRA–8808, pp. 11) **Hydrogeological and geochemical criteria for assessing sites of subsurface injection of EOR waste water in the Cold Lake area, Alberta, Canada.** Perkins, E. (Alberta Research Council, Edmonton, AB, Canada); Bachu, S.; Hitchon, B. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

Prediction of the fate and transport of liquid waste waters from Enhanced Oil Recovery (EOR) operations injected into deep aquifers in the Cold Lake area is critical for the selection of the three-dimensional position of safe injection zones because the hydrogeological and geochemical environments of these zones ultimately control the movement of the injected liquids. Therefore, a predictive assessment requires a regional analysis of the baseline conditions prior to commencement of injection. Ideally, the host aquifer should be thick, extensive and sufficiently porous and permeable to accept the rates injected at pressures that preclude the onset of hydraulic fracturing, and should not be more valuable for other uses. Overlying and underlying strata should be sufficiently thick, extensive and hydraulically strong to avoid leakage outside the injection aquifer. Adverse water-rock interactions should be avoided. Finally, the injection zone should not contain solution-collapse features, faults, extensive natural fractures, or unplugged or improperly plugged abandoned wells. This paper presents selected results of a study which specifically modelled the predicted effects of EOR waste water injection for a period of 30 y at multiple sites in the Cooking Lake, Mannville, McMurray and Clearwater Formations and into the Basal Cambrian sandstone in the Cold Lake area of Alberta. These examples illustrate how various criteria are considered for selecting injection aquifers in cases where the wealth of hydrogeological information permits detailed analysis of the hydrostratigraphy, of the natural flow regime in the multilayered system, and of the response of the system to sustained injections rates. 6 refs., 4 figs., 1 tab.

35740 (AOSTRA–8808, pp. 6) **Electrocoagulation of tar sand tailings pond waters.** Renk, R.R (Western Research Inst., Laramie, WY, USA). Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

Tar sand processing wastewaters from Syncrude Canada and other commercial and experimental operations were treated with a new electrocoagulation process that uses electrical current to destabilize and remove dissolved and suspended materials. The purpose of the treatment is to produce a low-cost, environmentally acceptable water for storage, reuse, or discharge. Bench-scale tests indicate an operating cost of around $0.03/m^3. Materials removed from the wastewater include dissolved and suspended materials, both organic and inorganic. The electrocoagulation processes removed 99% of the total suspended solids; 65% to 95% of the dissolved (0.45 um filtered) silica, calcium, and magnesium, and 50% to 95% of the total organic carbon. Microtox tests indicated a moderate reduction in toxicity after electrocoagulation. Electrocoagulation may provide an inexpensive way of separating solids from tailings. The water could then be stored, discharged, or reused, and the solids could be handled separately in a relatively dry form, thus potentially eliminating the need for large tailings ponds. 2 refs., 4 tabs.

0410 Environmental Aspects

35741 (AOSTRA–8808, pp. 5) **Environmental mediation in major oil sands developments. An alternative model to resolution of native, corporate and government interests in resource development approval processes.** Slavik, J.N. (Ackroyd, Piasta, Lennie, Edmonton, AB, Canada); Wallace, R.; Boucher, J. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02589). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sand, vol. 1.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

The potential use of a mediation process to resolve the conflicts between oil sands developers and Native peoples in northeastern Alberta has recently been explored by the Alberta Energy Resources Conservation Board (ERCB). This paper reports on the successful completion of such a process by the Fort McKay Indian Band and Syncrude Canada, Ltd., with the co-operation and participation of the ERCB, Alberta Environment, and associated interests. In 1985, in an attempt to identify and resolve concerns that had previously been expressed by the Indian Band, and thereby to avoid the need for a public hearing, the Syncrude Application Review Group (SARG) was established. This procedure successfully resolved many outstanding environmental and socio-economic problems long pursued by the Band through the traditional hearings process in Alberta. A subsequent process, the Syncrude Expansion Review Group, was also initiated after the successful conclusion of the SARG mediation and it, too, successfully resolved many outstanding problems. The advantages and disadvantages of this type of mediation are explored with a view to reaching broad conclusions applicable to other development applications elsewhere. 6 refs.

0420 Regulations

35742 (AOSTRA–8808, pp. 10) **Onshore federal reservoir management program and the relationship to heavy crude and tar sands in California.** Moore, T. (Bureau of Land Management); Wilkerson, G. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02589). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sand, vol. 1.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

The oil and gas mineral resources of the United States have been managed through public laws and administrative agencies since 1846. Administrative reorganizations within the Department of the Interior made in 1982 led to the establishment of two agencies for hydrocarbon reservoir management: the Minerals Management Service (MMS), responsible for offshore reservoir management and royalty accounting, and the Bureau of Land Management (BLM), which administers the onshore reservoir management program. Continuing legislative enactments have given MMS and BLM guidance for the administration of the exploration and development of heavy crude and tar sand deposits. The Combined Hydrocarbon Leasing Act of 1981 established a means of leasing tar sands in special areas all which occur outside California. A federal all-competitive leasing system was adopted in 1987 for the onshore hydrocarbon mineral estate. This legislation applies to heavy crude oil, but not to tar sands or oil shale. In 1988, a new drainage manual was drafted to help support the Drainage Protection Program, whose goal is to protect federal mineral resources from loss of royalties through off-lease drainage. Federal lessees must protect the federal mineral resource from drainage by either paying a compensatory royalty, drilling a protective well, or relinquishing their lease. There is currently no leasing program for tar sand in the USA. Heavy crude is leased under the conventional oil and gas leasing laws. The Metson Pool in Kern County is discussed as an example of enhanced recovery by steam injection. Statistics of heavy oil production in California are given. 8 refs., 4 figs., 3 tabs.

35743 (AOSTRA–8808, pp. 6) **Oil sands project application. Review process-mediation, not confrontation.** Evans, R.G. (Energy Resources Conservation Board, Calgary, AB, Canada). Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02589). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sand, vol. 1.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

The Energy Resources Conservation Board (ERCB) in Alberta has the responsibility of receiving applications for the development of energy projects in Alberta, and of granting approvals where warranted. Because of the quasi-judicial mandate under which the ERCB operates, any outside party that may be directly and adversely affected by a decision of the Board must be given an opportunity to know about and make representation regarding the application. Often a public hearing process has been used for this purpose. In many instances, however, it has been apparent that neither the information disssemination function nor the dispute resolution function was satisfactorily served by the hearing process. Thus, in several major oil sands projects in the past three years, the ERCB has utilized an alternative to the hearing process that is designed to provide maximum opportunity for information exchange on energy project applications, provide a less formal venue for discussing and resolving concerns or problems with the project, and give the various parties an opportunity to reach a reasonable compromise between their various economic, environmental, and social impact concerns. This paper describes the mediation process that has been used successfully in several instances, outlines the methodology and advantages of the process, and suggests some guidelines or limitations that may apply to its use. This process has been successful in developing effective communication channels between major oil sands developers and the local community, and also in resolving controversial issues between those parties.

35744 (AOSTRA–8808, pp. 7) **New oil sands conservation regulations for Alberta.** Evans, R.G (Energy Resources Conservation Board, Calgary, AB, Canada); Mayer, W.A. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02589). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sand, vol. 1.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

In February 1984, the Provincial Legislature of Alberta proclaimed the new Oil Sands Conservation Act, which consolidated the rules empowering the Energy Resources Conservation Board (ERCB) to regulate and monitor the development of its major hydrocarbon resource. Until recently, the rules for oil sands development in Alberta were borrowed from regulations developed for the conventional oil and gas industry and applied to in situ oil sands projects, or from the coal industry and applied to surface mining projects. In those cases where neither of these regulatory regimes was applicable, regulation was achieved by the ERCB through special conditions attached to operating approvals granted by the ERCB. In an attempt to simplify and consolidate these rules, and to tailor them more specifically to the oil sands industry and its unique circumstances, a new set of regulations has been promulgated. Following several years of careful drafting, an extensive consultation process was carried out that involved the ERCB, Alberta government departments, and a number of industry groups representing both the in situ and the oil sands mining project operators. In a number of aspects, the new regulations differ from those previously applied. This paper describes the organization and format of the new regulations, highlights those areas that are new or different in nature, and points out those areas where simplifications or efficiencies have been achieved.

05 NUCLEAR FUELS

35745 (WHC-SA–0581) **ASTM C-26 committee and standards development.** Delvin, W.L. Westinghouse Hanford Co., Richland, WA (USA). May 1989. 6p. Sponsored by DOE Defense

Programs. DOE Contract AC06-87RL10930. (CONF-890736–2: 30. annual meeting of the Institute of Nuclear Materials Management, Orlando, Florida, USA, 9-12 Jul 1989). Order Number DE89013533/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The C-26 Committee on Nuclear Fuel Cycle (C-26) is a typical ASTM committee organized to meet a specific need within the nuclear industry. This committee promotes knowledge and the development of standards for nuclear fuel cycle products, processes, and a variety of materials associated with those products and processes. The committee currently has 14 active subcommittees, most of which have responsibility for developing standards. Standards are developed, prepared, and published through a well-defined process established by ASTM and used by all ASTM committees. That process ensures consensus between various interests through a rigorously followed balloting procedure. The organization and work of C-26, particularly as they relate to safeguards, is briefly described in this paper. In addition, the standard process used by C-26, which is the basic ASTM process, is discussed. 5 refs.

35746 Managing hazards and evaluating safety in nuclear facilities. Russcher, G.E. (Battelle Pacific Northwest Labs., Richland, WA (USA)). v. of Probabilistic safety assessment and risk management PSA '87. Vol. 3. Verl. TUEV Rheinland, Koeln, Germany, F.R. (1987). DOE Contract AC06-76RL01830. (CONF-870820–: PSA 87: international topical meeting on probabilistic safety assessment and risk management, Zurich, Switzerland, 31 Aug - 4 sep 1987).

An assessment of potential hazards associated with operating a nuclear facility was used to appraise the safety system of the facility. First, a list of credible hazards representing potential energy sources was developed through use of a preliminary hazard analysis. Then, a team of technical and management staff members used a weighted selection process to develop a list of postulated accident scenarios for in-depth evaluation during a facility safety appraisal. During the appraisal, six major functional areas of the facility's safety system were reviewed to determine whether it was effectively controlling the hazards or precluding the postulated accidents.

35747 (CNIC–00214) **Metallogenetic condition and mineralization characteristics of uranium deposit No.114.** Niu Lin; Ma Fei; Yang Wanjin. China Nuclear Information Centre, Beijing, BJ (China). 1988. 16p. (In Chinese). (BUGRI–0003). Order Number DE89613485/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Deposit No 114 is one of the typical carbonate-type uranium deposits, that are widely distributed in South China. In this paper formational environment of host rock, wall-rock alteration, sulfur, oxygen, carbon isotopes, mineralization temperatures, ore compsitions were studied. Based on the U-Pb isotopic research three mineralization stages in deposit No 114 were established, namely 104 Ma, 61 Ma and 11 Ma. It is suggested, that the deposit No 114 is a polygenetic deposit formed primarily by supergene leaching and hydrothermal reworked. The uranium deposit has multi-sources, the main uranium source of which is from the granite body situated nearby. According to metallogenetic characteristics the authors suggest the favourable geological exploration guides for this kind of ore deposits.

35748 (INIS-mf–11457(v.1,2) v. 1) **Randomization of grab sample strategies for estimating the exposure of uranium miners to radon daughters.** Borak, T.B. (Colorado State Univ., Fort Collins (USA). Dept. of Radiology and Radiation Biology). Canadian Nuclear Association, Toronto, ON (Canada). 1985. (CONF-841016–: International conference on occupational radiation safety in mining, Toronto, Ontario, Canada, 15-18 Oct 1984). In *Occupational radiation safety in mining. Proceedings of the international conference (in two volumes).* Order Number DE89619926/JAW. Available from NTIS (US Sales Only), PC A99/MF A01 - OSTI; INIS.

In most underground uranium mines in the U.S.A., the integrated annual exposure to radon daughters is determined by combining periodic grab samples of working level with time of occupancy. This can lead to considerable uncertainties. One important consideration is the systematic bias introduced if the grab samples are taken the same time each day or during periods immediately following the repair of a faulty ventilation system. Procedures that randomize the time between measurements for each location are discussed. Complete randomization of all measurement times is often not feasibile due to manpower and fiscal considerations. Methods that compromise true randomization without introducing bias have been investigated. 6 figures, 1 table.

35749 (INIS-mf–11457(v.1,2) v. 1) **Dynamic approach to the implementation of the optimization principles in uranium mines.** Fourcade, N. (Centre d'Etude sur l'Evaluation de la Protection dans le Domaine Nucleaire, 92 - Fontenay-aux-Roses (France)); Zettwoog, P. Canadian Nuclear Association, Toronto, ON (Canada). 1985. (CONF-841016–: International conference on occupational radiation safety in mining, Toronto, Ontario, Canada, 15-18 Oct 1984). In *Occupational radiation safety in mining. Proceedings of the international conference (in two volumes).* Order Number DE89619926/JAW. Available from NTIS (US Sales Only), PC A99/MF A01 - OSTI; INIS.

This report presents the status of our considerations on the methodology for implementing the optimization principle in uranium mines, and the consequences that we draw in terms of occupational safety. No measures are planned concerning operating methods, job organization, or compliance with internal operational recommendations. (3 tables, 5 figures).

35750 (INIS-mf–11457(v.1,2) v. 1) **Characterization of radioactive long-lived dust present in uranium mines and mills atmospheres.** Duport, P.J. (Canadian Inst. for Radiation Safety, Elliot Lake, ON (Canada)); Edwardson, E. Canadian Nuclear Association, Toronto, ON (Canada). 1985. (CONF-841016–: International conference on occupational radiation safety in mining, Toronto, Ontario, Canada, 15-18 Oct 1984). In *Occupational radiation safety in mining. Proceedings of the international conference (in two volumes).* Order Number DE89619926/JAW. Available from NTIS (US Sales Only), PC A99/MF A01 - OSTI; INIS.

The physical characteristics of alpha-emitting long-lived dust were investigated in uranium mines and mills. The MMAD and AMAD were generally within the range of 2 to 10 μm with standard geometirc deviations between 3 and 5. Radon emanation rates from uranium bearing particles is about 30%. The activity air concentration of alpha emitting dust ranges from 10 to 700 mBq/m^3 in underground locations and from 10 to 2000 mBq/m^3 in mills.

35751 (INIS-mf–11457(v.1,2) v. 1) **Recreating the uranium mining environment of the 1950's.** Scott, A.G. (DSMA Atcon Ltd., Toronto, ON (Canada)). Canadian Nuclear Association, Toronto, ON (Canada). 1985. (CONF-841016–: International conference on occupational radiation safety in mining, Toronto, Ontario, Canada, 15-18 Oct 1984). In *Occupational radiation safety in mining. Proceedings of the international conference (in two volumes).* Order Number DE89619926/JAW. Available from NTIS (US Sales Only), PC A99/MF A01 - OSTI; INIS.

A picture of uranium mining practices at Elliot Lake in the late 1950's was built up from interviews with old miners and a review of contemporary literature. These practices were simulated at a pilot raise in an operating uranium mine. Extensive measurements were made of the resulting radiological conditions, which were similar to those reported in the 1950's. A general computer model of airborne concentrations versus ventilation was calibrated with the measurements, and used to estimate changes in miner exposure from the 1950's to today.

35752 (INIS-mf–11457(v.1,2) v. 1) **Radon emanation at the Mullenbach research uranium mine and its effects on ventilation planning.** Reim, K. (Saarberg-Interplan Uran GmbH, Saarbrucken (Germany, F.R.)); Thome, M.; Haupt, W. Canadian Nuclear Association, Toronto, ON (Canada). 1985. (CONF-841016–: International conference on occupational radiation safety in mining, Toronto, Ontario, Canada, 15-18 Oct 1984). In *Occupational radiation safety in mining. Proceedings of the international conference (in two volumes).* Order Number DE89619926/JAW. Available from NTIS (US Sales Only), PC A99/MF A01 - OSTI; INIS.

Experiments carried out at the Mullenbach test mine indicate that the air quantity prescribed by the German mining law for mechanized uranium mines is more than adequate to control radon daughters to within 4 WLM per year. Sealing of rock surfaces, application of positive ventilation pressure, watering down of blasted rock and variations in blasting techniques have a limited influence on the radon exhalation rate. In first approximation the radon exhalation of a future uranium mine can be estimated from drill cores recovered during the exploration stage. This assists the mining engineer in calculating the air requirements for a future mine.

35753 (CNIC–00147) **Investigation of hydrofluorination reactivity on denitrated uranium oxides.** Li Panyu; Feng Jiawu. China Nuclear Information Centre, Beijing, BJ (China). Jan 1988. 5p. (In Chinese). (SOF–202-001). Order Number DE89613219/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

The simultaneous reduction-hydrofluorination of dioxide, mixed oxide and trioxide of uranium prepared in fluidized bed denitration with hydrogen reduction is introduced. A method was proposed, which improves the reactivity of denitration products in hydrofluorination with ammonia reduction so that a high grade uranium tetrafluoride can be produced. The experimental results showed that a high grade uranium tetrafluoride can be prepared if the denitrated mixed uranium oxides producted by one and half step method were used. In certain conditions, this method may also improve the reactivity of uranium dioxid produced by one step denitration-reduction.

35754 (FMPC–2174) **Implementing requirements for radiation worker training from DOE Order 5480.11.** Fitzgerald, R.J. Westinghouse Materials Co. of Ohio, Cincinnati, OH (USA). Feed Materials Production Center. 1989. 10p. Sponsored by DOE Defense Programs. DOE Contract AC05-86OR21600. (CONF-8905155–1: Radiation protection workshop, Chicago, IL, USA, 16-17 May 1989). Order Number DE89013259/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

At the Feed Materials Production Center operated by Westinghouse Materials Company of Ohio, we have already initiated classroom training to implement the new requirements for Radiation Worker Training from DOE Order 5480.11. Those requirements include a variety of subjects.

From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

INPO 87-004 details specific topics to be covered in General Employee Training. At Boston Edison, these topics were combined with Company commitments and policies, and a belief that by relating the importance of quality concerns to each worker's daily lives, the application of Quality Assurance and Quality Control practices at Pilgrim Station could be enhanced. It was decided that if a commitment to quality was to be instilled in each worker, a high quality General Employee Training program should set the example. This commitment to quality was implemented using a fast paced, multi-image technique with a high quality visual and audio presentation format. The program was designed so that a minimum of changes would be needed over its life. The program's success has been proven since its installation in 1986. During updates to the Pilgrim General Employee Training Program since that time, no programming changes have been needed in the Quality Assurance module.

35756 (LA-UR–89-2151) **Unattended mode operation of specialized NDA [nondestructive assay] systems.** Klosterbuer, S.F.; Kern, E.A.; Painter, J.A.; Takahashi, S. Los Alamos National Lab., NM (USA). 1989. 6p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890736–23: 30. annual meeting of the Institute of Nuclear Materials Management, Orlando, FL, USA, 9-12 Jul 1989). Order Number DE89014287/JAW. Available from NTIS, PC A02/MF A01 - OSTI.

Nondestructive assay systems have been developed to allow data acquisition equipment to operate unattended in an automated mixed oxide facility, reducing inspector time in a facility and giving them time for other activities. Fewer inspector visits mean less impact on plant operators. Neutron detectors are located at key measurement points in the facility. Near each detector is located an electronics cabinet, which contains two JSR-11 shift registers, two COMPAQ Portable III computers, and a printer. The signal from the detector is split and sent to each shift register for redundancy and reliability. The software for unattended operation consists primarily of two programs, COLLECT and REVIEW. The COLLECT program runs on the computers in unattended operation; shift-register data are acquired each 60 s. The COLLECT program distinguishes between a normal background and a disconnected signal, between material moving near the detector and material in the detector, and whether the material in the detector is a sample or a californium normalization source. Depending on the type of assay, different data are stored on the hard disk. During an inspection, the inspector stops the current measurement campaign, examines the data from both computers briefly at the electronics cabinet, copies the campaign data to floppy disk, and starts another measurement campaign. These data are examined later in another location using the REVIEW program running on high performance microcomputers: a COMPAQ DeskPro 386/20 or equivalent. The REVIEW program uses graphical displays to enable the inspector to quickly search through the massive amounts of accumulated data to learn when samples were measured. Data from the desired measurements are then transferred to the International Atomic Energy Agency high-level neutron coincidence program for further analysis. 3 refs., 7 figs.

35757 (LA-UR–89-2152) **Remote-controlled NDA [nondestructive assay] systems for feed and product storage at an automated MOX [mixed oxide] facility.** Menlove, H.O.; Augustson, R.H.; Ohtani, T.; Seya, M.; Takahashi, S.; Abedin-Zadeh, R.; Hassan, B.; Napoli, S. Los Alamos National Lab., NM (USA). 1989. 8p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890736–24: 30. annual meeting of the Institute of Nuclear Materials Management, Orlando, FL, USA, 9-12 Jul 1989). Order Number DE89014286/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Nondestructive assay (NDA) systems have been developed for use in an automated mixed oxide (MOX) fabrication facility. Unique features have been developed for the NDA systems to accommodate robotic sample handling and remote operation. In addition, the systems have been designed to obtain International Atomic Energy Agency inspection data without the need for an inspector at the facility at the time of the measurements. The equipment is being designed to operate continuously in an unattended mode with data storage for periods of up to one month. The two systems described in this paper include a canister counter for the assay of MOX powder at the input to the facility and a capsule counter for the assay of complete liquid-metal fast breeder reactor fuel assemblies at the output of the plant. The design, performance characteristics, and authentication of the two systems will be described. The data related to reliability, precision, and stability will be presented. 5 refs., 10 figs., 4 tabs.

35758 (RFP–4207) **Electrorefining cell evaluation.** Bronson, M.C.; Thomas, R.L. (ed.). Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant. 14 Apr 1989. 26p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP03533. Order Number DE89014388/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Operational characteristics of the LANL electrorefining cell, a modified LANL electrorefining cell, and an advanced electrorefining cell (known as the CRAC cell) were determined. Average process yields achieved were: 75% for the LANL cell, 82% for the modified LANL cell, and 86% for the CRAC cell. All product metal from the LANL and modified LANL cells was within foundry specifications. Metal from one run in the CRAC cell exceeded foundry specifications for tantalum. The LANL and modified LANL cells were simple in design and operation, but product separation was more labor intensive than with the CRAC cell. The CRAC cell was more complicated in design but remained relatively simple in operation. A decision analysis concluded that the modified LANL cell was the preferred cell. It was recommended that the modified LANL cell be implemented by the Plutonium Recovery Project at Rocky Flats and that development of the CRAC cell continue. 8 refs., 22 figs., 12 tabs.

35759 (WHC-SA–0471) **Fast Flux Test Facility metal fuel pin fabrication.** Benecke, M.W.; Dittmer, J.O.; Feigenbutz, L.V. Westinghouse Hanford Co., Richland, WA (USA). May 1989. 15p. Sponsored by DOE Nuclear Energy. DOE Contract AC06-87RL10930. (CONF-890604–6: Annual meeting of the American Nuclear Society, Atlanta, GA, USA, 4-8 Jun 1989). Order Number DE89013531/JAW. Available from NTIS, PC A03/MF A01 - OSTI.

A new initiative to develop, irradiate, and qualify a binary uranium/zirconium metal fuel system in the Fast Flux Test Facility (FFTF) has been implemented by the Westinghouse Hanford Company for the US Department of Energy. Metal fuel test assemblies have been designed and fabricated and are now being irradiated in FFTF to provide the data needed to support the potential use of binary fuels in FFTF and other liquid metal reactors. These development efforts support licensing activities for metal fuel use in near-term advanced liquid metal reactors. New metal fuel pin design features, fabrication development, and fabrication processes for three metal fuel tests will be described and their irradiation status reported in this paper. 11 figs.

35760 (Y/TR–89/5) **Process and preparation facility for uranium tetrafluoride.** Petit, J. Oak Ridge National Lab., TN (USA). 1989. 16p. Translated from European Patent Application 0 295 999 A1, May 31, 1988. Sponsored by DOE Defense Programs. DOE Contract AC05-84OS21400. Order Number DE89014852/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The purpose of this invention is a process for the preparation of uranium tetrafluoride, an intermediate product widely used in the nuclear industry, from uranyl nitrate, a form through which new uranium or uranium from fuel reprocessing necessarily goes in practice. The process according to the invention is characterized by including the following steps: catalytic reduction by hydrogen, in the presence of H+ ions, of a solution of a soluble uranium salt (VI) in a solution of a soluble uranium salt (IV); reaction of the uranium (IV) salt obtained in the preceding step with hydrofluoric acid in order to obtain precipitation of the uranium tetrafluoride; and recovery of said uranium tetrafluoride in the form of a precipitate or an evaporate. 1 fig.

35761 (Y/TR–89/6) **Process and preparation facility for double uranium fluoride.** Petit, J. Oak Ridge National Lab., TN (USA). [1989]. 21p. Translation from the French Patent Application 0 295 998 A1, May 31, 1988. Sponsored by DOE Defense Programs. DOE Contract AC05-84OS21400. Order Number DE89014853/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The purpose of the invention is a process for preparing double fluoride of uranium and of an alkaline or alkaline-earth metal (ammonium being considered as an alkaline metal), from uranyl nitrate, the form to which new uranium or uranium from fuel reprocessing necessarily passes in practice. The process according to the invention is characterized by including the following steps: catalytic reduction by hydrogen, in the presence of H+ ions, of a solution of a soluble uranium salt (VI) in a solution of a soluble uranium salt (IV); reaction of the uranium (IV) salt obtained in the preceding step with fluoride ions, in the presence of ammonium, alkaline or alkaline-earth ions, to obtain precipitation of the double uranium and ammonium or alkaline metal or alkaline-earth fluoride; and recovery of the double fluoride in the form of a precipitate. 1 fig.

35762 **Separation potential of solvent extraction in the recovery of metals.** Kolarik, Z. (National Lab., Argonne, IL (US)). v.v of Chemical separations. King, J.C.; Navratil, J.D. Litarvin Literature, Arvada, CO (1986). (CONF-860411–: 1. international conference on separations science and technology, New York, New York, USA, 15-17 Apr 1986).

Solvent extraction can be applied to the recovery of metals from source materials as different as intermediate products like leach liquors (recovery of copper, nickel, cobalt, etc.), commercial products like wet-process phosphoric acid (recovery of uranium), and waste products like irradiated nuclear fuels (recovery of uranium and plutonium). Examples are given of extraction systems, in which the required selectivity and efficiency of the extraction of a particular metal are reached by a proper choice of the solvent and of the ionic medium. Extractants of all common types (i.e., acidic, basic or neutral compounds) and also different extractant combinations can be used as active components of the solvent. Possible improvements and future trends of extraction processes are discussed.

35763 (CONF-890753–1) **Simulation of a continuous rotary dissolver.** Carnal, C.L.; Hardy, J.E.; Lewis, B.E. Oak Ridge National Lab., TN (USA). 1989. 21p. Sponsored by DOE Nuclear Energy. DOE Contract AC05-84OR21400. From Summer computer simulation conference; Austin, Texas, USA; 24-27 Jul 1989. Order Number DE89009114/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This paper describes the simulation of a rotating, multistage chemical reactor that dissolves spent nuclear fuel for reprocessing in a breeder cycle. The continuous, time-dependent process model of a dissolver was developed using the Advanced Continuous Simulation Language (ACSL) to calculate various temperatures and the masses of the chemical constituents of the solution in each stage. The Gear integration algorithm (Gear 1971) was used to accommodate the stiff dynamics. An arrangement of interacting discrete sections was employed to cause fresh fuel to be added and dissolver rotations to occur at appropriate times. By changing various constants, the model can simulate the effect of different fuel compositions and operational scenarios. The model code is a valuable tool for analysis of the performance of the dissolution system and has been instrumental in its design. 5 refs., 7 figs.

35764 (INIS-SU–97, pp. 25-30) **Multifunctional organophosphorus extractants: a status report on development and applications.** Schulz, W.W. (Westinghouse Hanford Co., Richland, WA (USA)); Horwitz, E.P. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Up-to-date state of the development of science and technology of multifunctional organophosphorus extractants is considered. The detailed classification of these extractants is presented. They attracted pasticular interest because of affinity of some bifunctional phosphonates, phosphine oxides, carbamoylalkylphosphonates to trivalent Am, tetravalent and hexavalent actinides, trivalent lanthanides in strong mineral acids, and because of ability of some alkylpyrophosphoric acids to extract effectively U(4) from concentrated solutions of phosphoric acid. Application of these extractants for analytic purposes and in the field of nuclear technology is considered. 6 refs.; 3 tabs.

35765 (INIS-SU–97, pp. 154-157) **Study of salting effect of D2EHPA in chloride solutions.** Jiufang Lu (Tsinghua Univ., Beijing, BJ (China)); Yigui Li; Hongbing Ding; Teng Teng. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Solubility of D2EHPA in pure water (S_0=87.0 mg/l) and in aqueous solutions of alkali metal and ammonium chlorides and hydrochloric acid was measured. It was shown that salt addition to

aqueous solutions up to 3-5 M concentration caused the decrease of D2EHPA solubility according to Setschenow equation. The observed salting effect was explained from the viewpoint of electrostatic theory, the internal pressure theory, the scaled particle theory, Pitzer theory. 6 refs.; 3 tabs.

35766 (ORNL/FTR–3304) **[Analytical chemistry in nuclear technology, Karlsruhe, Germany and visit to Selbersdorf, Austria, June 3–22, 1989]: Foreign trip report.** Klatt, L.N. Oak Ridge National Lab., TN (USA). 5 Jul 1989. 13p. Sponsored by DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89014873/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Papers presented at the Second Karlsruhe International Conference on Analytical Chemistry in Nuclear Technology addressed topics in new developments in analytical methods, uranium and plutonium analysis, in-line, automated and non-destructive analysis, surface analysis, analysis for impurities and degradation products, trace analysis of radionuclides in the environment, and safeguards. Among the invited lectures, those addressing the political facts and fictions surrounding plutonium as a nuclear fuel, the status of in-line instrumentation in the reprocessing industry, techniques to reduce the amount of waste generated by the reprocessing plant support laboratory, and safeguard analysis needs for the large capacity reprocessing plants were particularly noteworthy. A successful and extended demonstration of in-line electrochemical measurement of aqueous plutonium concentration in a reprocessing plant was reported. In-line spectrophotometry developments at the Kernforschungszentrum Karlsruhe, Institut fuer Radiochemie are summarized.

0509 Transport and Storage

35767 (EPRI-NP–6425) **Design considerations for on-site spent-fuel transfer systems: Final report.** Jones, R.H.; Jones, C.R. Electric Power Research Inst., Palo Alto, CA (USA); Levy (S.), Inc., Campbell, CA (USA). c Jun 1989. 60p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Studies on spent fuel shipping logistics and operation make it clear that the use of large casks, i.e., 100–125 tons, is superior to smaller casks of similar construction. This superiority manifests itself in both transportation and/or shipping economics and safety as well as reduced personnel exposure in the processing of the casks. An on-site system for the transfer of spent fuel from the storage pool to a large shipping or storage cask, as well as the transfer of spent fuel directly from a storage cask to a shipping cask, could bring the large cask benefits to those restricted reactors. Sensing the need to look more closely at this opportunity, EPRI contracted with S. Levy, Incorporated of Campbell, CA to develop a set of design considerations for such transfer systems. Rather then embark on another design study, EPRI decided to first identify the system considerations that must be factored into any design. The format for this effort presents both the Consideration and the Rationale for the consideration. The resulting work identified thirty-six General Considerations and two Special Considerations. The Considerations are in the form of mandatory requirements and desirable but nonmandatory requirements. Additionally, a brief economic study was performed to get a feel for the cost considerations of on-site transfers. The study results suggest a relatively narrow set of scenarios where on-site transfers are economically superior to alternatives. These scenarios generally involve the use of concrete casks as on-site storage devices.

35768 (LA–11517-M) **HEU [highly enriched uranium] drum monitor manual (for confirmatory measurements).** Sprinkle, J.K. Jr.; Stovall, L.A. Los Alamos National Lab., NM (USA). Jun 1989. 61p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-36. Order Number DE89014386/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This manual describes the operation of the highly enriched uranium (HEU) drum monitor. The drum monitor measures the passive gamma-ray emissions from a sealed shipping container of HEU. These emissions are from ^{235}U and from daughters of ^{238}U. These radiations span a wide range of energy; consequently, each is susceptible to attenuation and shielding to a different degree. The combination of these measured gamma-ray rates with a weight measurement provides a unique signature for each item. These unique signatures can be determined with similar instruments at both ends of a material transfer between Department of Energy facilities. A consistent result from the two instruments indicates material control has been achieved, specifically that no material was lost or diverted. An additional objective of this instrument is to separate the material control issue from the measurement control issue. This is achieved by not calibrating the instrument and by reporting count rates instead of masses. Consequently, the results do not include calibration uncertainties, and therefore they are more precise. In addition, there are no sampling errors. A signal unique to the special nuclear material (SNM) is obtained nondestructively from the entire item. This instrument complements traditional containment and surveillance techniques by providing a precise measurement of an attribute unique to the SNM in the sample. 4 refs., 6 figs.

35769 (POEF-T–3504) **A review of the Model 5A uranium hexafluoride cylinder.** Dorning, R.E. II. Martin Marietta Energy Systems, Inc., Portsmouth, OH (USA). Quality and Technical Services Div. 23 May 1989. 20p. Sponsored by DOE Nuclear Energy. DOE Contract AC05-76OR00001. Order Number DE89014432/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Both the Model 5A (Monel 400) and 5A (Monel 400) Modified five-inch cylinders have been used at the Portsmouth GDP to withdraw, store, and ship highly enriched uranium hexafluoride. As a result of a generic cracking problem with Monel 400 valve-boss material, a cylinder modification was implemented in the mid 1970s. This modification resulted in the violation of the ASME "Code" stamp status of the Model 5A Modified cylinder. Hydrostatic testing-to- rupture data indicated that the Model 5A Modified cylinders had ruptured strengths equivalent to that of the original Model 5A cylinders. An independent consultant reviewed the available information and confirmed that the Model 5A Modified cylinders "will with proper maintenance continue to perform satisfactorily for many additional years of service." Based on the test data and consultant's review, DOE approved continued use of the 5A Modified cylinder and also requested procurement of replacement 5B cylinders be expedited. Currently, the 5A modified cylinders are in the production, storage, shipment cycle, and a sufficient number of 5B cylinders has been ordered to accommodate the projected product shipping requirements for the Navy flow. 3 tabs.

35770 (CFFTP-G–87013) **Conditioning and handling of tritiated wastes at Canadian nuclear power facilities.** Krochmalnek, L.S.; Krasznai, J.P.; Carney, M. Canadian Fusion Fuels Technology Project, Toronto, ON (Canada). Apr 1987. 12p. (CONF-870410–: 193. national meeting of the American Chemical Society, Denver, Colorado, USA, 5-10 Apr 1987). Order Number DE89620093/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Ontario Hydro operates a 10,000 MW capacity nuclear power system utilizing the CANDU pressurized heavy water reactor design. The use of D_2O as moderator and coolant results in the production of about 2400 Ci of tritium per MWe-yr. As a result, there is significant Canadian experience in the treatment, handling, transport and storage of tritiated wastes. Ontario Hydro operates its own reactor waste storage site which includes systems for volume reduction, immobilization and packaging of wastes. In addition, a facility to remove tritium from heavy water is presently being commissioned at the Darlington nuclear site. This facility will generate tritiated liquid and solid waste that will have to be properly conditioned prior to storage or disposal. The nature of these various wastes and the processes/packaging required to meet storage/disposal criteria are judged to have relevance to investigations in fusion facility waste arisings. Experience to date, planned operational procedures and ongoing R and D in this area are described.

35771 (CONF-881054–Vol.1) **1988 DOE model conference proceedings: Volume 1.** Analysas Corp., Oak Ridge, TN (USA). 1988. 366p. Sponsored by DOE Defense Programs. DOE Contract AC05-84OR21400. From 4. annual DOE model conference; Oak Ridge, TN, USA; 3-7 Oct 1988. Order Number DE89014700/JAW. Available from NTIS, PC A15/MF A01 - OSTI; GPO Dep.

These Proceedings of the October 3-7, 1988, DOE Model Conference are a compilation of the papers that were presented in the technical or poster sessions at the conference. Papers and posters not submitted for publication are not included in the Proceedings. The Table of Contents lists the titles of papers as well as the names of the presenters. These individuals are not, in all cases, the primary authors of the papers published. The actual title pages, appearing later with the papers, show the primary author(s) and all co-authors. The papers in all three volumes of the Proceedings appear as they were originally submitted for publication and have not been edited or changed in any way. Topics included in Volume 1 are Environmental Data Management, Site characterization technology, Wastewater treatment, Waste management in foreign countries, Transuranic waste management, and Groundwater characterization and treatment.

35772 (CONF-881054–Vol.2) **1988 DOE model conference proceedings: Volume 2.** Martin Marietta Energy Systems, Inc., Oak Ridge, TN (USA); Analysas Corp., Oak Ridge, TN (USA). 1988. 292p. Sponsored by DOE Defense Programs. DOE Contract AC05-84OR21400. From 4. annual DOE model conference; Oak Ridge, Tennessee, USA; 3-7 Oct 1988. Order Number DE89014701/JAW. Available from NTIS, PC A13/MF A01 - OSTI; GPO Dep.

Topics discussed in Volume 5 include environmental assessments and program strategies, waste treatment technologies, and regulations and compliance studies.

35776 (CONF-890470– VI.B.4.1-VI.B.4.14) **Effective transition from panel board to CRT-based process control.** Mayfield, N.E. (Westinghouse Hanford Co., Richland, WA (USA)); Baynes, P.A. Oak Ridge National Lab., TN (USA). Apr 1989. DOE Contract AC06-87RL10930. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

Nuclear process operators have controlled process operations using panel-board mounted instrumentation (PBMI) at Hanford since 1943. The decision was made to upgrade the B Plant Defense Waste Processing facility to state-of-the-art CRT-based process control, commonly referred to as a distributive control system (DCS) to improve operations safety, plant efficiency, and product quality. The safe and effective transition from PBMI to a DCS was the result of a cooperative effort between engineering, operations, and training, with full plant management support. Many elements of the upgrade had to be addressed: operator apprehension, vendor courses for the instructor and engineers, training interface with engineering and procurement, closed-loop communications, and structured implementation. Plant management considers this project a model example of effective implementation of new technology. This was a proactive and cooperative approach on a major facility upgrade. All too often training is left out of the planning stages on such projects. This more often than not creates reactive and unproductive training responses because of a lack of technical expertise and program development time. Other nuclear processing facilities are or will be facing this challenge. This paper presents the challenges and successes encountered during the transition to CRT-based process control. The intent of this presentation is to better prepare other training organizations for this type of transition.

35777 (CONF-890601–1) **Monitoring of corrosion in ORGDP cylinder yards.** Henson, H.M.; Barlow, C.R.; Frazier, J.L.; Ziehlke, K.T. Oak Ridge National Lab., TN (USA). 1989. 9p. Sponsored by DOE Nuclear Energy. DOE Contract AC05-84OR21400. From Packaging and transportation of radioactive materials: PATRAM '89; Arlington, VA, USA; 11-16 Jun 1989. Order Number DE89014080/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Uranium hexafluoride (UF_6) throughout the nuclear fuel cycle is handled and stored in cylinders which are designed, manufactured, and maintained in accordance with the ASME Boiler and Pressure Vessel Code for unfired pressure vessels (Section VIII). There are presently more than 40,000 of these cylinders within the DOE Oak Ridge Operations complex currently used for the storage of isotopically depleted material (process tailings). These tails cylinders, in 10- and 14-ton sizes, are 48 inches in diameter and were originally constructed of steel ASTM A285, then since 1978 of steel ASTM A516. The corrosion and monitoring of corrosion of the cylinders is discussed. 8 refs., 6 figs.

35778 (CONF-890721–21) **Radioactive materials packaging standards and regulations: Making sense of it all.** Pope, R.B.; Rawl, R.R. Oak Ridge National Lab., TN (USA). 1989. 9p. Sponsored by DOE Radioactive Waste Management. DOE Contract AC05-84OR21400. From Joint ASME/JSME pressure vessel and piping conference; Honolulu, Hawaii, USA; 23-27 Jul 1989. Order Number DE89010171/JAW. Available from NTIS, PC A02/MF A01 - OSTI.

Numerous regulations and standards, both national and international, apply to the packaging and transportation of radioactive material. These are legal and technical prerequisites to practically every action that a designer or user of a radioactive material transportation package will perform. The identity and applicability of these requirements and the bodies that formulate them are also not readily understood. This paper addresses the roles that various international bodies play in developing and implementing the various regulations and standards. It uses the US regulatory and standards-making bodies to illustrate how international requirements feed the domestic control of packaging and transport. It explains the scope and interactions between domestic and international regulatory and standards agencies and summarizes the status and major standards activities at the international level. The overview provided by this paper will be valuable to designers and users of radioactive material packages for better understanding and use of both standards and regulations, and for complying with regulatory requirements in the radioactive materials transportation field. 11 refs., 2 figs.

35779 (CONF-8904232–1) **Methodology for hazardous waste surveys.** Chiu, S.; Martino, L. Argonne National Lab., IL (USA). 1989. 16p. Sponsored by DOE Energy Research. DOE Contract W-31109-ENG-38. From Pacific basin conference on hazardous waste; Singapore, China; 2-7 Apr 1989. Order Number DE89013171/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The effective regulation and management of hazardous waste requires fundamental information on the amount, location, and source of the wastes as well as the adequacy of current and future facilities for treatment, storage, and disposal. Surveys of industries that generate or manage hazardous waste are essential to the development of such information. This paper addresses several methodological issues related to hazardous waste surveys, proposes a method to identify and classify hazardous waste, and suggests methods to use when designing and conducting surveys to maximize the accuracy of the data being collected. 8 refs., 1 fig., 3 tabs.

35780 (DOE/NV/10384–26) **Nevada Test Site Radionuclide Inventory and Distribution Program: Report number 5: Areas 5, 11, 12, 15, 17, 18, 19, 25, 26, and 30.** McArthur, R.D.; Mead, S.W. Nevada Univ., Las Vegas, NV (USA). Water Resources Center. Jun 1989. 157p. Sponsored by DOE Defense Programs. DOE Contract AC08-85NV10384. Order Number DE89014524/JAW. Available from NTIS, PC A08/MF A01 - OSTI; GPO Dep.

Between 1981 and 1986, more than 8,000 in situ measurements of gamma-emitting radionuclides were made on the Nevada Test Site as part of the Radionuclide Inventory and Distribution Program. These measurements, along with additional information from aerial surveys and analysis of soil samples, were used to estimate total inventories and distributions of radionuclides of NTS origin in the surface soil. The project's results for Yucca Flat and six ground zeros in Areas 18 and 20 were published in four previous reports. This report presents the results from the rest of the contaminated areas on the NTS, including Plutonium Valley, Frenchman Flat, the Buggy site, test facilities in Areas 25 and 26, and Areas 17 and 18. It also gives the results of measurements in several relatively uncontaminated regions in Areas 12, 15, and 19 and along the Fortymile Canyon and Mid-Valley Roads. 20 refs., 82 figs., 22 tabs.

35781 (DOE/RW–88.061) **1987 United Kingdom radioactive waste inventory.** Electrowatt Engineering Services Ltd., Horsham (UK). Oct 1988. 328p. (UKN–54). Order Number DE89620341/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

This report describes the stocks of radioactive wastes in the United Kingdom, together with projections of future arisings. Operational and decommissioning wastes are considered for both committed and prospective plant. Arisings are from power reactors, commercial reprocessing, fuel manufacture, medical and industrial sources and research and development. Data are presented for the wastes in their raw form and as conditioned for disposal. The data which refer to the situation on 1.1.87 are shown by producer and globally, in summary tables. The information presented for each producer includes a description of the activities that generate the wastes and a discussion of how stocks and arisings may have changed from earlier predictions. This is supplemented by a stream by stream tabulation showing the waste type, volume, density, conditioning factor and gross alpha and beta activity. The global projections are presented in tabular and graphical manner, and the changes from earlier projections are discussed. The scenarios which underly the projections are also presented.

35782 (DOE/RW–0225) **Quarterly report on program cost and schedule: First quarter FY 1989.** USDOE Office of Civilian Radioactive Waste Management, Washington, DC (USA). 1989. 37p. Sponsored by DOE Radioactive Waste Management. Available from OSTI.

This report is intended to provide a summary of the cost and schedule performance for the Civilian Radioactive Waste Management Program. Performance data are presented for each of the major program elements. Also included in this report is the status of the Nuclear Waste Fund revenues and disbursements. This report includes performance data through December 1988.

35783 (DOE/RW–0235) **MRS system study summary report.** USDOE Office of Civilian Radioactive Waste Management, Washington, DC (USA). Jun 1989. 149p. Sponsored by DOE Radioactive Waste Management. Available from OSTI.

The passage of the Nuclear Waste Policy Amendments Act (NWPAA) of 1987 prompted the Department of Energy (DOE) to reexamine the role of the monitored retrievable storage (MRS) facility in the waste- management system, and to this end a series of systems studies was conducted. The overall conclusion is that an MRS facility, whose principal function initially is to receive and store spent fuel, would enhance the waste-management system by providing early spent- fuel acceptance and flexibility for the system. However, these advantages would be gained at an increase in cost. The studies did not identify any significant benefit at present in either consolidating spent fuel or packaging it (encapsulating into disposal containers) at the MRS facility. The results of this study were used in developing the DOE's current position on the role of the MRS facility in the waste-management system.

35784 (DOE/SSDP–0062) **Shippingport Station Decommissioning Project preparation of the reactor pressure vessel: Topical report.** Westinghouse Hanford Co., Shippingport, PA (USA). 8 Jun 1989. 33p. Sponsored by DOE Nuclear Energy. DOE Contract AC06-87RL10930. Order Number DE89014216/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This Topical Report is a synopsis of the preparation of the Reactor Pressure Vessel (RPV) at the Shippingport Station Decommissioning Project (SSDP). The information is provided as a part of the Technology Transfer Program to document the preparation activities in support of the one-piece removal and shipment of the RVP package. 6 refs., 7 figs., 2 tabs.

35785 (EPRI-NP–5675) **Below regulatory concern owners group: A general review of the IMPACTS-BRC Code: Final Report.** Kennedy, W.E., Jr.; Farris, W.T.; Baker, D.A.; Strenge, D.L.; Peloquin, R.A. Electric Power Research Inst., Palo Alto, CA (USA); Battelle Pacific Northwest Lab., Richland, WA (USA). c May 1989.

119p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC06-76RL01830. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The Electric Power Research Institute (EPRI) is conducting a project to develop support documentation for a rulemaking petition exempting specific nuclear power plant waste streams under the US Nuclear Regulatory Commission's (NRC) general Below Regulatory Concern (BRC) policy statement. In its policy statement, the NRC named the IMPACTS-BRC computer program as the primary compliance tool for granting exemptions. Because of this important role, EPRI authorized Battelle, Pacific Northwest Laboratories (BNW) to conduct a review of the computer program and its documentation. This report contains a summary of our general review of the IMPACTS-BRC computer program. In addition to reviewing the program and its supporting documentation, we conducted a performance evaluation and a sensitivity analysis of the operational software. The performance evaluation consisted of verifying the operation of the code, providing a general comparison of the results generated with results produced by other methods for similar input assumptions, and evaluating the Pathway Dose Conversion Factors (PDCFs) and Dose Conversion Factors (DCFs) used in the program. 21 refs., 13 figs., 25 tabs.

35786 (EPRI-NP–5679) **Below Regulatory Concern Owners Group: Assessment of the IMPACTS-BRC code: Final report.** Rogers, V.C.; Murphy, E.S. Electric Power Research Inst., Palo Alto, CA (USA); Rogers and Associates Engineering Corp., Salt Lake City, UT (USA). c May 1989. 103p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Electric Power Research Institute (EPRI) has initiated a special program effort for the development of a Nuclear Regulatory Commission (NRC) rulemaking petition to exempt certain very low activity nuclear power plant waste types as being Below Regulatory Concern (BRC). EPRI is to provide the technical research to support the BRC petition. One of the research tasks in the EPRI program entails a review and verification of the IMPACTS-BRC computer program used by NRC to independently evaluate individual and population radiological impacts from routine treatment and disposal of BRC wastes. A review of the IMPACTS-BRC computer program has been made to evaluate the sensitivity of the code to modeling assumptions and parameter values, assess conservatisms in the code, and verify that the code correctly performs the specified dose calculations. This report describes the results of this review. 6 refs., 3 figs., 13 tabs.

35787 (EPS–3/HA/3) **Removal of radium-226 from uranium mining effluents. Final report of a joint government-industry program.** Averill, D.W.; Moffett, D.; Webber, R.T.; Whittle, L.; Wood, J.A. Environment Canada, Ottawa, ON (Canada). Environmental Protection Service. Dec 1984. 41p. Order Number DE89620395/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Uranium mining and milling operations usually generate large quantities of solid and liquid waste materials. A slurry, consisting of waste rock and chemical solutions from the milling operation, is discharged to impoundment areas (tailings basins). Most of the radioactive material dissolved in tailings slurries is precipitated by the addition of lime and limestone prior to discharge from the mill. However, the activity of one radioisotope, radium-226, remains relatively high in the tailings basin effluents. In Canada, radium-226 is removed from uranium mining and milling effluents by the addition of barium chloride to precipitate barium-radium sulphate. Although dissolved radium-226 activities are generally reduced effectively, the process is considered to have two undesirable characteristics: the first related to suspended radium-226 in the effluents and the second to ultimate disposal of the $(Ba,Ra)SO_4$ sludge. A government-industry mining task force established a radioactivity sub-group in 1974 to assist in the development of effluent guidelines and regulations for the uranium mining industry. The investigation of more effective removal methods was recommended, including the development of mechanical treatment systems as alternatives to settling ponds. Environment Canada's Wastewater Technology Centre (WTC) initiated a bench scale study in March, 1976 which was designed to assess the feasibility of using precipitation, coagulation, flocculation and sedimentation for the removal of radium-226. In 1977, the study was accelerated with financial assistance from the Atomic Energy Control Board. Improved radium removals were obtained in bench scale batch tests using barium chloride as the precipitant and either alum or ferric chloride as the coagulant. A more comprehensive bench scale and pilot scale process development and demonstration program was formulated.

35788 (INIS-mf–11462) **Survey of radioactive waste disposal in Ireland.** O'Donovan, N.; Hone, C.; Turvey, F.J. Nuclear Energy Board, Dublin (Ireland). Dec 1988. 9p. Order Number DE89620407/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

This survey was undertaken by the Nuclear Energy Board (N.E.B) to assess the quantity of radioactive waste disposed of in Ireland and the methods used. The regulatory control of disposal is carried out on an ongoing basis by the Board's inspectors and is commented on routinely in the Board's annual report.

35789 (INIS-mf–11945) **Leaching of vitrified high-level-active-waste in a near reality simulated repository system. Final report.** Froeschen, W.; Wolf, G.K. Heidelberg Univ. (Germany, F.R.). Physikalisch-Chemisches Inst.; Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.). 1987. 58p. (In German). Order Number DE89788275/JAW. Available from NTIS (US Sales Only), PC A04/MF A01.

In the FRG it is planned to vitrify the high level waste from spent fuel reprocessing and to dispose of in a salt-mine. If water penetrates into the repository a highly corrosive brine (Q-brine) will be formed and radioactive material may be leached from the glasses and transported to human environment. The corrosion system of brine, corroded steel containers of the vitrified waste, and waste-glasses was investigated under near reality conditions. Experiments in hydrothermal environment were carried out including gamma radiation of the waste-glasses and ceramic In Can Lining between glasses and metallic containments. Screening experiments by application of external cobalt-gamma-radiation showed no principal changes in leaching behaviour of simulate glasses compared to leaching without radiation. Radiation effects result in pH changes mainly which are diminished by buffer capacity of Q-brine. Lining of steel containments with ceramic fleece does not reduce leaching but retards solution of Mo and Sr into brine. Decreasing of elements Sr, Cs and Mo in the near surface area of the glass and increasing of Zr and Ti has been found to be enhanced considerably in presence of canister corrosion products in Q-brine as well as in NaCl-leaching solution. (orig.) With 13 refs., 22 figs.

35790 (LA-UR–89-2066) **Development of neutron multiplicity counters for safeguards assay.** Ensslin, N. Los Alamos National Lab., NM (USA). 1989. 6p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890736–27: 30. annual meeting of the Institute of Nuclear Materials Management, Orlando, FL, USA, 9-12 Jul 1989). Order Number DE89014300/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This paper reports on the development of a new generation of neutron multiplicity counters for assaying impure plutonium. The new counters will be able to obtain three measured parameters from the neutron multiplicity distribution and will be able to determine sample mass, multiplication, and (α,n) reaction rate, making it possible to obtain a more matrix-independent assay of moist or impure materials. This paper describes the existing prototype multiplicity counters and evaluates their performance using assay variance as a figure of merit. The best performance to date is obtained with a high-efficiency, low die-away-time thermal neutron counter with shift-register electronics. 10 refs., 2 figs., 4 tabs.

35791 (NEI-SE–35) **Short summary of international workshop on principles for disposal of radioactive and other hazardous wastes, Stockholm 7-10 june 1988.** National Inst. of Radiation Protection, Stockholm (Sweden). 22 Jun 1988. 22p. (CONF-8806378–: International workshop on principles for disposal of radioactive and other hazardous wastes, Stockholm, Sweden, 7-10 Jun 1988). Order Number DE89618364/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The purpose of the workshop has been to discuss legal, scientific and practical aspects of disposal of low and intermediate level radioactive waste (LLW and ILW) and other types of hazardous wastes. During the autumn the National Institute of Radiation Protection will produce proceedings from the workshop. These proceedings will be published by the Department of Environment and Energy and will include opening addresses, invited paper, reports from discussions from plenary sessions as well as working groups and the recommendations agreed upon. In annexes will be found reports from the different working groups as well as the more interesting parts of the national presentations that served as discussion material for the different working groups.

35792 (NUREG/CR–4759) **Demonstration of a performance assessment methodology for high-level radioactive waste disposal in basalt formations.** Bonano, E.J.; Davis, P.A.; Shipers, L.R.; Brinster, K.F.; Beyler, W.E.; Updegraff, C.D.; Shepherd, E.R.; Tilton, L.M.; Wahi, K.K. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Engineering; Sandia National Labs., Albuquerque, NM (USA). Jun 1989. 183p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC04-76DP00789. (SAND–86-2325). Available from NTIS, PC A09/MF A01 - GPO - OSTI.

This document describes a performance assessment methodology developed for a high-level radioactive waste repository mined in deep basalt formations. This methodology is an extension of an earlier one applicable to bedded salt. The differences between the two methodologies arise primarily in the modeling of round-water flow and radionuclide transport. Bedded salt was assumed to be a porous medium, whereas basalt formations contain fractured zones. Therefore, mathematical models and associated computer codes were developed to simulate the aforementioned phenomena in fractured media. The use of the methodology is demonstrated at a hypothetical basalt site by analyzing seven scenarios: (1) thermohydrological effects caused by heat released from the repository, (2) mechanohydrological effects caused by an advancing and receding glacier, (3) normal ground-water flow, (4) pumping of ground water from a confined aquifer, (5) rerouting of a river near the repository, (6) drilling of a borehole through the repository, and (7) formation of a new fault intersecting the repository. The normal ground-water flow was considered the base-case scenario. This scenario was used to perform uncertainty and sensitivity analyses and to demonstrate the existing capabilities for assessing compliance with the ground-water travel time criterion and the containment requirements. Most of the other scenarios were considered perturbations of the base case, and a few were studied in terms of changes with respect to initial conditions. The potential impact of these scenarios on the long-term performance of the disposal system was ascertained through comparison with the base-case scenario or the undisturbed initial conditions. 66 refs., 106 figs., 27 tabs.

35793 (NUREG/CR–5352) **VAM2D–Variably saturated analysis model in two dimensions: Version 5.0 with hysteresis and chained decay transport: Documentation and user's guide.** Huyakorn, P.S.; Kool, J.B.; Robertson, J.B. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Engineering; HydroGeoLogic, Inc., Herndon, VA (USA). May 1989. 297p. Sponsored by Nuclear Regulatory Commission. Available from NTIS, PC A14/MF A01 - GPO - OSTI.

This report documents a two-dimensional finite element model, VAM2D, developed to simulate water flow and solute transport in variably saturated porous media. Both flow and transport simulation can be handled concurrently or sequentially. The formulation of the governing equations and the numerical procedures used in the code are presented. The flow equation is approximated using the Galerkin finite element method. Nonlinear soil moisture characteristics and atmospheric boundary conditions (e.g., infiltration and evaporation), are treated using Picard and Newton-Raphson iterations. Hysteresis effects and anisotropy in unsaturated hydraulic conductivity can be taken into account if needed. The contaminant transport simulation can account for advection, hydrodynamic dispersion, linear equilibrium sorption, and first-order degradation. Transport of a single component or a multi-component decay chain can be handled. The transport equation is approximated using an upstream weighted residual method. Several test problems are presented to verify the code and demonstrate its utility. These problems range from simple one-dimensional to complex two-dimensional and axisymmetric problems. This document has been produced as a user's manual. It contains detailed information on the code structure along with instructions for input data preparation and sample input and printed output for selected test problems. Also included are instructions for job set up and restarting procedures. 46 refs., 53 figs., 24 tabs.

35794 (NUREG/CR–5363) **A study of the use of crosslinked high-density polyethylene for low-level radioactive waste containers.** Soo, P.; Anderson, C.I.; Clinton, J.H. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Engineering; Brookhaven National Lab., Upton, NY (USA). Jun 1989. 122p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC02-76CH00016. (BNL-NUREG–52196). Available from NTIS, PC A07/MF A01 - GPO - OSTI.

A comprehensive research program has been completed to evaluate the effects of chemical and gamma-irradiation environments on the mechanical properties of crosslinked high-density polyethylene. The studies included uniaxial creep tests and crack initiation and crack propagation studies in statically-stressed U-bend samples. From the results obtained standard testing protocols were recommended for quantifying the various failure modes which could be present in this material during service as a low-level waste container. 24 refs., 66 figs., 20 tabs.

35795 (NUREG/CR–5389) **Analysis of alternative waste isolation concepts.** Christianson, M.C.; Brady, B. Nuclear Regulatory Commission, Washington, DC (USA). Div. of High-Level Waste Management; Itasca Consulting Group, Inc., Minneapolis, MN (USA). Jun 1989. 148p. Sponsored by Nuclear Regulatory Commission. Available from NTIS, PC A07/MF A01 - GPO - OSTI.

This report presents the results of a numerical analysis which compares the vertical and horizontal waste emplacement concepts currently under consideration for long-term nuclear waste storage. The two concepts are compared in terms of drift and borehole stability and compliance with the suggested design criteria. Thermal results are presented which illustrate the thermomechanical response of the rock adjacent to the emplacement drifts and boreholes. Mechanical results are presented which illustrate the stability of the emplacement rooms and boreholes as a result of in-situ and thermally-induced stresses. Conclusions include the finding that the horizontal waste emplacement geometry does not meet DOE's room temperature design criterion. It was also found that the horizontal emplacement drift is more sensitive to joint displacement than is the vertical emplacement drift. The boreholes used for horizontal emplacement are more sensitive to joint displacement than those for vertical emplacement. In both emplacement schemes, borehole stability will be a problem at the intersection of the borehole and emplacement drift. 25 refs., 54 figs., 5 tabs.

35796 (ORNL/FTR–2948) **Numerical modeling and tracer study of groundwater—Yenliao Nuclear Power Plant site, Taipei, Taiwan, June 5–12, 1988: Foreign trip report.** Yeh, G.T.; Solomon, D.K. Oak Ridge National Lab., TN (USA). 6 Jul 1988. 13p. Sponsored by DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89014057/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The travelers attended a meeting held at TPC Headquarters in Taipei for two days. On the first day, the Interim Report I on numerical analysis of groundwater flow at a nuclear power plant site was the subject of extensive discussion. Conclusions and recommendations were formulated and agreed upon by TPC/National Taiwan University (NTU) investigators and ORNL staff. On the second day, the anticipated tracer experiment for determining contaminant transport parameters was discussed, and recommendations were made by ORNL staff.

35797 (ORNL/FTR–3300) **[Environmental assessment for radioactive waste disposal, Daeduk, South Korea, May 12–June 14, 1989]: Foreign trip report.** Lee, S.Y. Oak Ridge National Lab., TN (USA). 30 Jun 1989. 13p. Sponsored by DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89013269/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report describes the traveler's consulting activities for the Korea Advanced Energy Research Institute on its R and D projects for nuclear waste disposal. The traveler worked with staff scientists

and engineers on mineral characterization methodologies, adsorption study approaches and designs, and radionuclide migration pathway analyses and its associated problems. The travelers conducted four sessions of group discussion on (1) the selection of backfill materials, (2) experimental approaches of radionuclide transport in an engineered barrier and a near-field environment, (3) the mineralogical aspect of far-field radionuclide migration, and (4) experimental techniques for the measurement of radionuclide and geomedia interaction. 8 refs.

35798 (ORNL/Sub–88-21642/1) **Assessment of potential worker exposure for the Tumulus Disposal Demonstration Project: Fiscal year 1988 annual report.** Styers, D.R. Oak Ridge National Lab., TN (USA). Mar 1989. 67p. Sponsored by DOE Defense Programs. DOE Contract AC05-84OR21400. Order Number DE89013767/JAW. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

The Tumulus Disposal Demonstration Project (TDDP) is evaluating the Tumulus technology for the disposal of solid low-level radioactive waste (LLW). The primary objective of the demonstration project is zero-release of radioactivity during the 100-year institutional control period of the facility. Radiological monitoring of the unit operations necessary for the preparation and placement of LLW onto the Tumulus pad was performed in order to determine the radiological exposures received by the workers as they disposed of this waste. These operations involved the placing of the primary waste containers into the secondary concrete disposal vaults, the grouting of these vaults, the sealing of the disposal containers, and the placing of the grouted vaults onto the Tumulus pad. Contact exposure rate measurements and transferable surface contamination levels were determined for the primary and secondary containers. The contact surface radiation levels were measured on all of the monitored primary waste disposal forms and had a dose equivalent rate of <200 mrem/hr (<2 mSv/hr).* This rate satisfies the requirement of the Waste Acceptance Criteria (WAC). 7 refs., 5 figs., 14 tabs.

35799 (PDER/BRP–9014198) **Appalachian States Compact Low-Level Radioactive Waste management survey, 1987.** Singh, K.N. Pennsylvania Dept. of Environmental Resources, Harrisburg, PA (USA). Bureau of Radiation Protection. Mar 1989. 125p. Order Number DE89014198/JAW. Available from NTIS, PC A06/MF A01 - OSTI.

Since the enactment of the Low-Level Radioactive Waste Disposal Act in February 1988, the Commonwealth of Pennsylvania has undertaken major steps to develop a Low-Level Radioactive Waste (LLRW) Disposal Facility within its borders for the exclusive use of radioactive material licensees in the Appalachian States Compact. In order to adequately plan for the design and development of that facility, it is essential to obtain accurate data on LLRW being generated in the Compact. To that end, the Division of Nuclear Safety of the Pennsylvania Bureau of Radiation Protection (BRP) conducted a survey to determine volume and activity of LLRW shipped and stored in 1987 by the licensees in the Appalachian States Compact. The 1986 LLRW survey included licensees in Pennsylvania and Maryland, while surveys conducted prior to 1986 involved only Pennsylvania licensees. So this is the first survey conducted by BRP that has included all four states of the Compact.

35800 (PNC-TN–8440-88-016) **Development of glass melter for the PNC Tokai Vitrification Facility.** Torata, Shin-ichiro; Sasaki, Noriaki; Horie, Misato; Tsunoda, Naomi. Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan). Oct 1988. 16p. Order Number DE89790902/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The development of the glass melter which will be used in the HLLW vitrification facility has been performed since 1977. The design and operational experiences has been accumulated through the process tests in the cold engineering facilities. The results obtained in these periods have been considered in the design of the Tokai Vitrification Facility (TVF), the construction of which has already been started in the spring of 1988. The present PNC melter system includes several features as the result of PNC's own improvements and modifications. The results of the melter development will be described in this paper mainly on the special features which are developed in PNC, such as glass fiber additives, induction-heated bottom drain nozzle and remote handling technique. The mock-up test using the new mock up melter which was constructed following the TVF final design has started to verify the process performance.

35801 (PNL–6821) **Regulatory requirements important to Hanford single-shell tank waste management decisions.** Keller, J.F.; Woodruff, M.G. Pacific Northwest Lab., Richland, WA (USA). Jun 1989. 117p. Sponsored by DOE Defense Programs. DOE Contract AC06-76RL01830. Order Number DE89014795/JAW. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

This report provides an initial analysis of the regulations that may be pertinent to SST management activities (e.g., characterization, disposal, retrieval, processing, etc.) and the interrelationships among those regulations. Waste disposal decisions regarding SST waste must consider the regulatory requirements against which technical solutions will be evaluated. Regulatory requirements can also be used as guidelines for management and disposal of waste in a manner that protects human health and safety and the environment. Also, in cases where waste management regulations do not specifically address a waste form, such as radioactive mixed waste, the SST waste may come under the purview of a number of regulations related to radioactive waste management, hazardous waste management, and water and air quality protection. This report provides a comprehensive review of the environmental pollution control and radioactive waste management statutes and regulations that are relevant to SST waste characterization and management. Also, other statutes and regulations that contain technical standards that may be used in the absence of directly applicable regulations are analyzed. 8 refs., 4 figs.

35802 (PNL–6882) **Technology assessment guide for application of engineered sorbent barriers to low-level radioactive waste disposal sites.** Freeman, H.D.; Jones, E.O.; Depner, J.P. Pacific Northwest Lab., Richland, WA (USA). Jun 1989. 76p. Sponsored by DOE Defense Programs. DOE Contract AC06-76RL01830. Order Number DE89014611/JAW. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

An engineered sorbent barrier (ESB) uses sorbent materials (such as activated carbon or natural zeolites) to restrict migration of radionuclides from low-level waste sites. The permeability of the ESB allows moisture to pass while the sorbent material traps or absorbs contaminants. In contrast, waste sites with impermeable barriers could fill with water, especially those waste sites in humid climates. A sorbent barrier can be a simple, effective, and inexpensive method for restricting radionuclide migration. This report provides information and references to be used in assessing the sorbent barrier technology for low-level waste disposal. The ESB assessment is based on sorbent material and soil properties, site conditions, and waste properties and inventories. These data are used to estimate the thickness of the barrier needed to meet all performance requirements for the waste site. This document addresses the following areas: (1) site information required to assess the need and overall performance of a sorbent barrier; (2) selection and testing of sorbent materials and underlying soils; (3) use of radionuclide transport models to estimate the required barrier thickness and long-term performance under a variety of site conditions; (4) general considerations for construction and quality assurance; and (5) cost estimates for applying the barrier. 37 refs., 6 figs., 2 tabs.

35803 (PNL–6898) **324 and 325 Building Hot Cell Cleanout Program: Air lock cover block refurbishment.** Katayama, Y.B.; Holton, L.K. Jr.; Gale, R.M. Pacific Northwest Lab., Richland, WA (USA). May 1989. 28p. Sponsored by DOE Nuclear Energy. DOE Contract AC06-76RL01830. Order Number DE89014579/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The high-density concrete cover blocks shielding the pipe trench in the hot-cell air lock of the 324 Building Radiochemical Engineering Cells had accumulated fixed radioactivity ranging from 1100 to 22, 000 mrad/hr. A corresponding increase in the radiation exposure to personnel entering the air lock, together with ALARA concerns, led to the removal of the contaminated concrete surface with a hydraulic spaller and the emplacement of a stainless steel covering over a layer of grout. The resultant saving in radiation exposure is estimated to be 7200 mrad for personnel completing burial box runs for the 324 and 325 Building Hot Cell Cleanout Program. Radiation exposure to all staff members entering the air lock is now at least 50% lower. 3 refs., 22 figs., 1 tab.

35804 (PNL-SA-15641) **Treatment needs for Greater-Than-Class C low-level waste.** Ross, W.A.; Brouns, R.A.; Burkholder, H.C. Pacific Northwest Lab., Richland, WA (USA). Sep 1988. 7p. Sponsored by DOE Nuclear Energy. DOE Contract AC06-76RL01830. (CONF-880903-55: Spectrum '88: international topical meeting on nuclear and hazardous waste management, Pasco, WA, USA, 11-15 Sep 1988). Order Number DE89014436/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Greater-Than-Class C (GTCC) radioactive wastes are those low-level wastes that exceed the 10CFR61 limits for shallow-land burial but are not within the historical definition of high-level wastes (i.e., spent fuel and first-cycle reprocessing wastes). The GTCC category can include all transuranic (TRU) wastes, although for the purposes of this paper, contact-handled defense TRU wastes are excluded because of the major efforts in the past decade to prepare them for disposal at the Waste Isolation Pilot Plant (WIPP). Thus, the GTCC category includes all high-activity and remote-handled TRU wastes regardless of origin. This paper defines the need for treatment of existing and projected GTCC low-level radioactive wastes in the United States. The sources, characteristics, treatment considerations, and methods for treatment are reviewed. 10 refs., 1 fig., 2 tabs.

35805 (PNL-SA-16454) **An evaluation of near-field host rock temperatures for a spent fuel repository.** Altenhofen, M.K.; Lowery, P.S. Pacific Northwest Lab., Richland, WA (USA). Nov 1988. 16p. Sponsored by DOE Radioactive Waste Management. DOE Contract AC06-76RL01830. (CONF-881143-7: American Institute of Chemical Engineers annual meeting, Washington, D.C., USA, 27 Nov - 2 dec 1988). Order Number DE89014462/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A repository heat transfer analysis has been performed by the Pacific Northwest Laboratory (PNL) for the US Department of Energy's Performance Assessment Scientific Support Program. The objective of this study was to evaluate the near-field thermal environmental conditions for a spent fuel repository system. A spent fuel logistics analysis was performed using a waste management system simulation model, WASTES-II, to evaluate the thermal characteristics of spent fuel received at the repository. A repository-scale thermal analysis was performed using a finite difference heat transfer code, TEMPEST, to evaluate the near-field host rock temperature. The calculated temporal and spatial distributions of near-field host rock temperatures provide input to the repository source term model in evaluations of engineered barrier system performance. 9 refs., 10 figs., 2 tabs.

35806 (PNL-SA-16743) **TRUEX process laboratory studies with Hanford complexant concentrate waste: Part 2, Test for solvent poisoning.** Swanson, J.L. Pacific Northwest Lab., Richland, WA (USA). May 1989. 8p. Sponsored by DOE Nuclear Energy. DOE Contract AC06-76RL01830. (CONF-8905122-7: 13. actinide separations conference, Idaho Falls, ID, USA, May 1989). Order Number DE89014461/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The TRUEX solvent extraction process, which has undergone extensive development at Argonne National Laboratory, is being considered for use in the processing of various wastes at Hanford. The objective of such processing would be to extract (and concentrate into a small volume of TRU waste) the contained plutonium and uranium so that the bulk of the waste can be treated as low-level waste. As part of their testing and evaluation of this process with actual wastes, Westinghouse Hanford Company (WHC) has asked the Pacific Northwest Laboratory (PNL) to perform tests to determine in a preliminary way if the wastes contain some material that was not encountered in the earlier studies and that might "poison" the solvent in some way, thereby making TRUEX processing difficult or very expensive. This report discusses the results obtained with complexant concentrate (CC) waste. This waste contains large quantities of organic complexing agents (e.g., EDTA, HEDTA) and organic acids (e.g., citric, tartaric), and/or degradation products of these materials, that were added to the waste during an earlier processing for the removal of strontium. It was thus thought to be a waste having a higher probability than most wastes of containing material that might have deleterious effects of TRUEX processing. 1 fig., 2 tabs.

35807 (SAND-88-0624) **Thermal-conductivity data for tuffs from the unsaturated zone at Yucca Mountain, Nevada: Yucca Mountain Project.** Nimick, F.B. Sandia National Labs., Albuquerque, NM (USA). Jun 1989. 85p. Sponsored by DOE Radioactive Waste Management. DOE Contract AC04-76DP00789. Order Number DE89014594/JAW. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

This report is primarily a means of transmitting thermal-conductivity data to the Yucca Mountain Project properties data base. As such, the majority of the report is a compilation of these data for 45 samples of tuffaceous rocks from Yucca Mountain, Nevada; some of the data have been published previously. Brief discussions of the experiment technique (transient-line-source) and experiment uncertainties also are included. The accuracy of the thermal-conductivity data cannot be assessed at present; precision (repeatability) has been determined to be better than {+ }2%, in most cases. 15 refs., 5 figs., 1 tab.

35808 (SAND-88-2294) **A synopsis of analyses (1981-87) performed to assess the stability of underground excavations at Yucca Mountain: Yucca Mountain Project.** Ehgartner, B.L.; Kalinski, R.C. Sandia National Labs., Albuquerque, NM (USA). Dec 1988. 60p. Sponsored by DOE Radioactive Waste Management. DOE Contract AC04-76DP00789. Order Number DE89014596/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This paper reviews 14 analyses that were performed by 10 different investigators during the course of 7 yr to assess the preclosure (up to 100 yr) stability of underground excavations for a potential nuclear waste repository located at Yucca Mountain, Nevada. The analyses were primarily based on thermomechanical models of the conceptual design of shafts and drifts. The material properties, codes, and design configurations used in the analyses varied because of the acquisition of additional data and refinement in codes and design over that period of time. However, all the analyses indicate that shafts and drifts can be constructed and will remain stable with minimum ground support through decommissioning of the repository. This information supports the feasibility of constructing a safe exploratory shaft facility and the expectation that it will remain stable should repository construction and waste emplacement follow. 63 refs., 2 tabs.

35809 (SAND-88-2785) **Preliminary analyses in support of in situ thermomechanical investigations.** Bauer, S.J.; Costin, L.S.; Holland, J.F. Sandia National Labs., Albuquerque, NM (USA). Dec 1988. 139p. Sponsored by DOE Radioactive Waste Management. DOE Contract AC04-76DP00789. Order Number DE89014616/JAW. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

The Yucca Mountain Project, managed by the Nevada Operations Office of the US Department of Energy, is examining the feasibility of siting a repository for high-level nuclear waste at Yucca Mountain on and adjacent to the Nevada Test Site. As part of the site characterization, a series of in situ thermomechanical experiments have been proposed, which are to be conducted in the exploratory shaft test facility. Three of the experiments, Canister-Scale Heater, Thermal Stress, and Heated Room, will provide some of the data required to (1) assess the thermomechanical response of tuff rock masses at several scales and (2) validate numerical models that may be used in the repository design process. In this report, the results of preliminary analyses of three in situ thermomechanical experiments are presented. The major objective of these analyses has been to provide some guidance to the experiment planners regarding the expected temperatures, displacements, and stresses with regard to time and position based on the very preliminary stage of the experiment design. The analyses will assist in selection and placement of instrumentation. Further, successful completion of these analyses demonstrates the ability to model the experiments, given the simplifying assumptions presented. Limitations of the analyses performed and the experiments as currently designed are also discussed. 13 refs., 72 figs., 4 tabs.

35810 (SAND-88-3352) **Waste Isolation Pilot Plant brine field pH measurements: Technique and interpretation.** Krumhansl, J.L. Sandia National Labs., Albuquerque, NM (USA). Jun 1989. 50p. Sponsored by DOE Radioactive Waste Management.

DOE Contract AC04-76DP00789. Order Number DE89014607/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

pH measurements made in conjunction with the Waste Isolation Pilot Plant Materials Interface Interactions Test (MIIT) are interpreted. The pH drop noted over time is correlated with other changes associated with MIIT brine evaporation. Magnesium buildup appears important, because a combination of high concentrations and elevated temperatures (about 90°C) can produce hydrochloric acid through hydrolysis of the magnesium ion, possibly explaining why the brines appeared to become more acid over time. For pH measurement techniques in concentrated brines, pH papers were useless in concentrated saline solutions. When traditional glass pH electrodes were substituted, other complications arose. For mildly acidic brines of known hydrogen ion concentration, the measured pH generally fell below the expected value. Also, the electrode responded differently to different salts. Magnesium chloride had a greater effect than sodium chloride, which in turn had a greater effect than potassium chloride. For nearly neutral brines, electrode drift became a serious problem, and when the meter finally stabilized, readings were significantly above those of the solutions from which the brines were prepared. The size of this positive deviation depended on the electrode being used and its previous conditioning. Both drift and the unusual high values were mitigated or eliminated in brines where a buffer was present in concentrations greater than about 0.001 molar. 22 refs., 11 figs., 9 tabs.

35811 (SAND–89-0462) **Systems analysis, long-term radionuclide transport, and dose assessments, Waste Isolation Pilot Plant (WIPP), southeastern New Mexico; March 1989.** Lappin, A.R.; Hunter, R.L.; Garber, D.P.; Davies, P.B. (eds.). Sandia National Labs., Albuquerque, NM (USA). Apr 1989. 671p. Sponsored by DOE Radioactive Waste Management. DOE Contract AC04-76DP00789. Order Number DE89014586/JAW. Available from NTIS, PC A99/MF A01 - OSTI; GPO Dep.

This report summarizes the current understanding of the expected long-term behavior of the Waste Isolation Pilot Plant (WIPP) repository and estimates long-term radionuclide doses in a series of six analyses investigating both undisturbed repository (Case I) and performance in response to a relatively high-consequence human intrusion (Case II). It is the result of an intensive effort over a short time. The US Department of Energy (DOE) decided to have Sandia National Laboratories prepare this report as a result of a meeting held January 5, 1989. The conceptual model of the expected long-term behavior of the WIPP repository used in this report was formulated in early to mid January 1989, drawing and understanding developed over the past decade. Numerical modeling of ground-water flow, radionuclide transport, and doses to humans began January 20, 1989 and was completed March 20, 1989. 332 refs., 98 figs., 69 tabs.

35812 (WHC-EP–0165) **Westinghouse Hanford Company 100 Areas environmental releases for 1987.** Rokkan, D.J. Westinghouse Hanford Co., Richland, WA (USA). Jul 1988. 26p. Sponsored by DOE Defense Programs. DOE Contract AC06-87RL10930. Order Number DE89014200/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Measured operational releases to the environment from Westinghouse Hanford 100 Areas facilities during calendar-year (CY) 1987 are reported. Radioanalyses of routine samples from radioactive liquid and airborne streams were performed using the Westinghouse Hanford 100-N Radioanalytical Laboratory and the analytical services of the US Testing Company located in Richland, Washington. Analyses of nonradioactive samples were performed in the laboratories of the Hanford Environmental Health Foundation. All releases were within N Reactor Technical Specification limits. The radioactive release from N Reactor exhibited no adverse trends during CY 1987. This was not unexpected because the reactor had an operating period of only 6.4 days. This shortness of operation was due to the extended "standdown" of the reactor. The standdown was an ordered shutdown for the purpose of implementing a series of upgrades to the safety systems of the reactor. The standdown began on January 7, 1987, and continued through the remainder of that year. Because of the extended length of the shutdown, the radiological and chemical releases in 1987, with one exception, are less than those in 1986. Hydrazine use increased in 1987 by 390% during the standdown because considerably more of this oxygen-scavenging chemical is required to control corrosion in the piping systems of the reactor when it is not operating. 5 refs., 13 figs., 17 tabs.

35813 (WHC-EP–0182-13) **Tank farm surveillance and waste status summary report for April 1989.** Thurman, J.M. Westinghouse Hanford Co., Richland, WA (USA). Jun 1989. 32p. Sponsored by DOE Defense Programs. DOE Contract AC06-87RL10930. Order Number DE89014201/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report is Westinghouse Hanford Company's official inventory for high-level radioactive waste stored in underground tanks at the Hanford Site. Data that depict the status of stored, high-level waste and tank vessel integrity are contained within the report. The intent of the report is to provide data on each of the existing 177 underground waste tanks, as well as to provide supplemental information regarding tank anomalies and ongoing investigations.

35814 (WHC-EP–0237) **Assessment of Basalt Waste Isolation Project's borehole mud pits soils and sediments for chemical constituents: Summary report.** Connelly, M.P.; Chou, C.J. Westinghouse Hanford Co., Richland, WA (USA). May 1989. 69p. Sponsored by DOE Environment Health & Safety. DOE Contract AC06-87RL10930. Order Number DE89014199/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

As part of an effort to characterize the geologic formations underlying the Hanford Site, 98 boreholes were drilled in support of the Basalt Waste Isolation Project. Review of drillings records indicated that certain drilling operations between 1973 and 1983 may have introduced hazardous substances into the environment. The suspected substances are constituents of drilling fluids that were channelled into pits adjacent to the drill sites. This report details operations at the seven boreholes determined to have the greatest potential for contamination. It also describes the study conducted to determine if hazardous chemicals are present, and if so identifies their concentrations and spatial distribution. The study was intended to provide input for decisions regarding remedial action. The data presorted herein were reviewed to the regulations of the Resource Conservation and Recovery Act of 1976. The findings are listed. The midputs are not considered dangerous according to the guidelines set by the Washington Department of Ecology. The pits do not require action under the provisions of the Resource Conservation and Recovery Act of 1976. The original borehole reclamation project will proceed as planned. 9 refs., 7 figs., 11 tabs.

35815 (WHC-EP–0275) **Liquid effluent study project plan.** Sommer, D.J.; Flyckt, D.L.; Johnson, V.G.; Law, A.G.; Sonnichsen, J.C. Westinghouse Hanford Co., Richland, WA (USA). Jun 1989. 35p. Sponsored by DOE Defense Programs. DOE Contract AC06-87RL10930. Order Number DE89014119/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

At the request of the Washington Department of Ecology and the US Environmental Protection Agency, the US Department of Energy is undertaking a study to document the discharge history and chemical characteristics of liquid discharges to the soil column at the Hanford Site. The activities conducted as part of this study will characterize Hanford Site liquid effluents; assess waste disposal sites and groundwater contamination; and evaluate the potential for migration of contaminants within disposal site soils. The results of the study will be utilized to determine the need for additional liquid effluent analysis, and/or provide a basis for assessing the need for more extensive health risk assessment studies. 13 refs., 3 figs., 2 tabs.

35816 (WINCO–1007) **Evaluation of minimum-fluidizing velocity correlations for bed particles used in fluidized-bed calcination processes.** Kirkbride, R.A. Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (USA). Nov 1988. 155p. Sponsored by DOE Nuclear Energy. DOE Contract AC07-84ID12435. Order Number DE89013727/JAW. Available from NTIS, PC A08/MF A01 - OSTI; GPO Dep.

Minimum-fluidizing velocities were measured for 73 beds obtained by screening fourteen types of bed material encountered in waste calcination processes. Several mixtures of different particles sizes were also examined. Spherical glass beads were used as a reference material. Particle densities ranged from 1311 to 3630 kg/m^3 and particle diameters ranged from 0.17 to 1.08 mm. Bulk voidages

in the beds ranged from 0.30 to 0.51, and bed voidage at the minimum-fluidizing velocity was 1 to 2% higher than the bulk voidage. Particle sphericities were calculated; their values ranged as low as 0.60. Twenty-three minimum-fluidizing velocity correlations were obtained from a literature search. Minimum-fluidizing velocities predicted by the correlations were compared to experimentally measured minimum-fluidizing velocities for the 73 beds used in this study. The accuracy criterion applied to the correlations was that the predicted values of minimum-fluidizing velocity must be within 20% of the measured value to be considered acceptable. Four correlations reported in the literature showed potential for predicting minimum-fluidizing velocities within 20%. The four acceptable correlations (within 20% accuracy) obtained from the literature predicted minimum-fluidizing velocities within 15% of the measured velocity, for the bed materials tested in this study. 15 refs., 3 figs., 22 tabs.

35817 (WSRC-RP–89-87) **Experimental facilities for pyrochemical development at the Savannah River Site.** Rudisill, T.S. Westinghouse Savannah River Co., Aiken, SC (USA). 1989. 17p. Sponsored by DOE Defense Programs. DOE Contract AC09-89SR18035. (CONF-8905122–5-Vugraphs: 13. actinide separations conference, Idaho Falls, ID, USA, May 1989). Order Number DE89013552/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Savannah River Site is installing a multifunctional Pyrochemical Development Laboratory (PDL) to pursue new technology for plutonium recovery. Many future plutonium scrap feed stocks cannot be efficiently processed in SRS facilities using aqueous flow sheets and existing equipment due to poor dissolution behavior or corrosive constituents. Pyrochemical treatment processes will be developed to convert these scraps into viable feedstocks for SRS processing. A technology data base will also be developed for pyrochemical process commonly used to recover plutonium from retired weapon components. The intent of all development programs is to integrate pyrochemical technology with the existing aqueous capabilities at SRS in way that maximizes plutonium recovery, minimize waste generation, and provides an essential contingency capacity for plutonium processing. Five gloveboxes will be provided in the PDL. A stationary, resistance heated furnace will be located in each of two boxes. These furnaces will provide the PDL with the capability to develop flow sheets involving most pyrochemical operations. A third glovebox in the laboratory will be used for plutonium hydriding. Nondestructive analysis (NDA) instrumentation will be installed in a fourth. The furnace, hydriding, and NDA gloveboxes will be provided with high quality argon atmospheres. In order to maintain the purity, the fifth glovebox will serve the primary entrance, exit, and staging area for the glovebox line.

35818 (WSRC-RP–89-288) **Solidification of low-level radioactive waste at the Savannah River Site.** Langton, C.A. Savannah River Lab., Aiken, SC (USA). 1989. 3p. Sponsored by DOE Defense Programs. DOE Contract AC09-89SR18035. (CONF-8905152–1: NIST and NRC workshop on cement solidification of low level radioactive waste, Gaithersburg, Maryland, USA, 31 May - 12 jun 1989). Order Number DE89013770/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Aqueous-based process waste and other small volume wastes including basin sludge and incinerator ash will be solidified in cement-based wasteforms at SRS. A variety of inorganic solidifying agents are used depending on the chemistry, contaminants, and processing characteristics of the waste. In some cases, pretreatment of the waste is used to reduce the activity of the waste and/or to remove the hazardous characteristics of the waste. In the case of DWPF saltstone, pretreatment is used to reduce 137 Cs and 90 Sr concentration to Class A levels and in-situ treatment (chemical reactions between the cementitious solids and waste) is used to remove the toxic metal characteristic of the waste. Chemical reduction of the Cr^{+6} to Cr^{+3} and subsequent precipitation of $Cr(OH)_3$, (low solubility) occurs as the result of reactions between the cementitious raw materials and the waste liquid. In summary waste treatment and solidification used at SRS is designed to meet both South Carolina and Federal requirements for maintaining the quality of the groundwater at the disposal site boundary. 2 refs.

35819 Nuclear waste package container corrosion in simulated salt repository environments. Cleary, H.J. (Columbia General, Inc., 110 N. 25 Mile Avenue, Hereford, TX (US)). v.v of Proceedings of the Electrochemical Society fall meeting. Volume 88-2 (extended abstracts). The Electrochemical Society, Pennington, NJ (1988). (CONF-881061–: Electrochemical Society fall meeting, Chicago, IL, USA, 9-14 Oct 1988).

This paper presents an overview of the program conducted by the DOE Salt Repository Project to develop a waste package for long-term containment of high level commercial and defense nuclear wastes in a geological bedded-salt deposit in Deaf Smith County, Texas. Although this location has recently been dropped from further consideration as a possible site for the first national repository, a discussion of the work on corrosion in not brine environments should be of general interest. The basic requirement that must be met by the waste package container has been established by the U.S. Nuclear Regulatory Commission: radionuclides of the nuclear waste must be contained within the waste packages for 300 to 1000 years after closure of the repository. Low carbon steel was selected early in the program because of its good mechanical properties, ease of fabrication (including weldability), low cost, and anticipated low susceptibility to localized corrosion in brine environments. When employed as a thick-walled container, steel would also provide some shielding of the radiation emanating from the waste form. Specific dimensions of the reference container designs varied with the different types of nuclear waste form (defense waste versus assemblies of commercial spent fuel from pressurized-water or boiling-water reactors). The largest container, designed to contain boiling-water reactor fuel assemblies, measured 15.8 feet in length by 33.3 inch outer diameter, and a cylinder wall thickness of 3.9 inches. The wall thickness required to resist lithostatic pressure is 3 inches, leaving an allowance for corrosion losses of 0.9 inch. A total of about 36,000 packages is estimated to be ultimately needed for the first repository using these waste packages designs.

35820 A database for reviews and evaluations of high-level waste documents. Interrante, G.C. (National Bureau of Standards, Gaithersburg, MD (US)); Messina, C.; Harrison, S.A. v.v of Proceedings of the Electrochemical Society fall meeting. Volume 88-2 (extended abstracts). The Electrochemical Society, Pennington, NJ (1988). (CONF-881061–: Electrochemical Society fall meeting, Chicago, IL, USA, 9-14 Oct 1988).

An automated storage and retrieval system that uses a commercially available database management system (DBMS) has been developed to serve as a data index for high-level waste (HLW) reports and as a database containing NBS evaluations of HLW reports. The evaluations are critical reviews of reports, generated mainly by the Department of Energy (DOE), on topics related to processes involved in the degradation of the engineered barrier system designed to contain and control the release of radionuclides contained in waste packages to be placed in a repository for HLW. The intention is to use this system within the framework of the capabilities of a personal computer. The data can be accessed with a DBMS that operates on no more than 512K of memory. All aspects of the PC system are fully functional in respect to the usage of scientific notations, Greek letters and super- and sub-scripts. Thus, on-screen displays, print outs and search strings may contain chemical formulas or proper scientific names. The principal barriers proposed for use in the waste package are metal alloys and borosilicate glass. The technical problems of primary interest in the waste package involve leaching of the glass, corrosion of the alloys, transport processes within the waste package, and modelling efforts aimed at permitting prediction of long-term behaviors. The reviews focus attention on the availability of data that are applicable to the resolution of technical issues that must be considered in the process of obtaining a license to build a repository.

35821 Surface reactions of natural glasses. White, A.F. (Univ. of California, Lawrence Berkeley Lab., Berkeley, CA (US)). v.v of Nuclear waste management II. Passchier, W.F.; Bosnjakovic, B.F.M. American Ceramic Society Inc., Westerville, OK (1986). (CONF-8608225–: 3. international symposium on ceramics in nuclear waste management, Chicago, IL, USA, 28-30 Aug 1986).

Reactions at natural glass surfaces are important in studies involving nuclear waste transport due to chemical control on ground water in host rocks such as basalt and tuff, to potential diffusion into natural hydrated glass surfaces and as natural analogs for waste

glass stability. Dissolution kinetics can be described by linear surface reaction coupled with cation interdiffusion with resulting rates similar to those of synthetic silicate glasses. Rates of Cs diffusion into hydrated obsidian surfaces between 25^0 and 75^0C were determined by XPS depth profiles and loss rates from aqueous solutions. Calculated diffusion coefficients were ten others of magnitude more rapid than predicted from an Arrhenius extrapolation of high temperature tracer diffusion data due to surface hydration reactions.

35822 Recent advances in centrifugal contactor design. Leonard, R.A. (Argonne National Lab., IL (USA)). *Separation Science and Technology (USA),* 23(12,13): 1473-1487 (Oct 1988). (CONF-871038–: 5. symposium on separation science and technology for energy applications, Knoxville, TN, USA, 26-29 Oct 1987).

Advances are being made in the design of the Argonne centrifugal contactor for solvent extraction. These contactors are being built, tested, and used to implement the TRUEX process for the cleanup of nuclear waste liquids. These advances include (1) using off-the-shelf, face-mounted motors; (2) modifying the contactor so that relatively volatile solvents can be used; (3) adding a high-level liquid detector that can be used to alert the plant operator of process upsets; (4) providing secondary feed ports; (5) optimizing support frame design; (6) devising a linear design with external interstage lines so that stages can be allocated as needed for extraction, scrub, strip, and solvent cleanup operations; and (7) developing features that facilitate contactor operation in remote facilities.

35823 (CONF-890207–35) **Residual radioactive material guidelines: Methodology and applications.** Yu, C.; Yuan, Y.C.; Zielen, A.J.; Wallo, A. III. Argonne National Lab., IL (USA). 1989. 10p. Sponsored by DOE Radioactive Waste Management. DOE Contract W-31109-ENG-38. From Waste management '89; Tucson, Arizona, USA; 26 Feb - 2 mar 1989. Order Number DE89013651/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A methodology to calculate residual radioactive material guidelines was developed for the US Department of Energy (DOE). This methodology is coded in a menu-driven computer program, RESRAD, which can be run on IBM or IBM-compatible microcomputers. Seven pathways of exposure are considered: external radiation, inhalation, and ingestion of plant foods, meat, milk, aquatic foods, and water. The RESRAD code has been applied to several DOE sites to calculate soil cleanup guidelines. This experience has shown that the computer code is easy to use and very user-friendly. 3 refs., 8 figs.

35824 (CONF-890470– IV.A.2.1-IV.A.2.9) **Using computer-based training to facilitate radiation protection review.** Abercrombie, J.S.; Copenhaver, E.D. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

In a national laboratory setting, it is necessary to provide radiation protection overview and training to diverse parts of the laboratory population. This includes employees at research reactors, accelerators, waste facilities, radiochemical isotope processing, and analytical laboratories, among others. In addition, their own radiation protection and monitoring staffs must be trained. To assist in the implementation of this full range of training, ORNL has purchased prepackaged computer-based training in health physics and technical mathematics with training modules that can be selected from many topics. By selection of specific modules, appropriate radiation protection review packages can be determined to meet many individual program needs. Because our radiation protection personnel must have some previous radiation protection experience or the equivalent of an associate's degree in radiation protection for entry level, the computer-based training will serve primarily as review of major principles. Others may need very specific prior training to make the computer-based training effective in their work situations.

35825 (CONF-890470– IV.B.5.1-IV.B.5.12) **Transferring generic SARA/OSHA training to US Department of Energy facilities.** White, A.; McKinley, T. Oak Ridge National Lab., TN (USA). Apr 1989. DOE Contract AC05-76OR00033. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

The Technical Resources and Training Section staff at Oak Ridge National Laboratory have developed three extensive training programs for hazardous waste treatment, storage, and disposal facility workers as required by SARA/OSHA, 29 CFR 1910.120. The ORNL program is widely recognized as one of the best in the DOE system. ORNL and ORAU, who manages the Training Resources and Data Exchange (TRADE) network for DOE, entered into a cooperative relationship to respond to the many requests for DOE contractors for copies of the ORNL training materials. This discussion describes the ORNL program and the process of turning it into a series of generic tools which can be used by additional DOE facilities to meet the training requirements established by SARA/OSHA, 29 CFR 1910.120. The speakers describes how the materials are being used by DOE facilities as well as plans for additional resources to be developed through TRADE.

35826 (CONF-890470– IV.B.6.1-IV.B.6.15) **Computer based training state of the art systems.** McCauley, W. (Oak Ridge Associated Universities, TN (USA)); Weseman, M. Oak Ridge National Lab., TN (USA). Apr 1989. DOE Contract AC05-76OR00033. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

The use of Computer Based Training (CBT) in the nuclear industry has increased significantly in the last five years. Training professional are faced with many options in selecting instructional systems to help get the job done, and need to know if CBT is an appropriate solution to meet organization needs. The purpose of this paper is to help you assess the advantages and limitations of Computer Based Training and considerations for selecting and implementing CBT systems as one part of an overall training program. Four CBT courses dealing with control of ionizing radiation are reviewed. This paper is written and compiled by the staff of Oak Ridge Associated Universities based on work performed over the last five years for the Department of the Navy, Department of the Army, and the Department of Energy.

35827 (CONF-890470– IV.B.7.1-IV.B.7.6) **Indoctrination: using interactive video to teach attitudes and knowledge in general employee training.** Smigelski, L.B. (Westinghouse Hanford Co., WA (USA)). Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

The Westinghouse Hanford Company (WHC) has developed a prototype interactive video course, Hanford General Employee Training (HGET). Interactive video combines sound, motion and still photographs from a videodisc with the graphics, text and instructional capability of computer-based instruction. The course includes indoctrination on over 40 topics identified by the Institute of Nuclear Power Operations (INPO), the US Department of Energy, and the Westinghouse Hanford Company that are to be included in the indoctrination of new and requalifying employees. In addition, the course requires trainees to make positive choices when confronted with real life scenarios showing violations of safety, security and quality standards. This courseware is different from most GET courses because it puts the trainee in a role-playing mode and requires the trainee to recognize and respond in the WHC way. Initial

data project a reduction of 40-60% in training time for HGET as compared to stand-up instruction.

35828 (CONF-890470– V.A.3.1-V.A.3.7) **Management of training counting beans or demonstrating results.** Mooney, W.L. III (Paducah Gaseous Diffusion Plant, KY (USA)). Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

A well-planned, well-staffed and well-housed training program may not function effectively. With the onset of a new DOE order on training design and development methodology, a new audience for a relatively old process will inevitably fall victim to the slam-bang effect. Training personnel are generally enthusiastic and confident about the potential effects of their program. Because they are enthusiastic and put forth a maximum effort, they and their management expect the new program to have dramatic results - a slam-bang effect. As a result, the management of training programs is likely to become an arduous and disappointing task if the manager has no way of showing results. Currently, most of the focus at DOE contractor facilities is on preparation for and ultimate compliance with the DOE order on accreditation with little concern for the method or methods by which to determine its ultimate success or failure. Methods such as program evaluation, goal attainment scaling and multi-attribute utility (MAUT) analysis may provide training management the information to make decisions to improve training quality and demonstrate results. These methods will be discussed in detail and presented as a management tool to complement the accreditation activities at DOE contractor facilities.

35829 (CONF-890470– VI.B.6.1-VI.B.6.8) **Managing training to maximize employee articulation.** Rockwell, N.C. (Westinghouse Idaho Nuclear Co., Inc., Idaho Falls (USA)). Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

Through agreements with other training and educational institutions, training managers can make it possible for employees to work toward career and educational goals without having to duplicate previously acquired competencies. By considering both company goals and employee educational goals, training managers can realize some of the articulation benefits typically associated with the public school system. At the Idaho National Engineering Laboratory, several contractor training managers have established cooperative agreements with local college administrators, agreements that allow contractor employees university credit for completing specific contractor training and professional development courses.

35830 (CONF-890470– VI.B.9.1-VI.B.9.8) **Crisis management program for senior officials.** Knazovich, M.; Painter, S. Oak Ridge National Lab., TN (USA). Apr 1989. DOE Contract AC05-76OR00033. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

The Emergency Preparedness Special Interest Group (EP SIG), a part of the Training Resources and Data Exchange (TRADE) peer-to-peer network of Department of Energy (DOE) and contractor training and development personnel, developed the Crisis Management Program for Senior Officials. The program was developed in response to commonly-identified training need for basic information in emergency management for DOE and contractor organization senior officials. The Crisis Management Program for Senior Officials is a set of materials which consists of a program brochure, an introductory videotape, an assessment tool for senior officials, a series of five management briefings on crisis management topics, a suggested one-day seminar for senior officials off-site, follow-up activities on-site, and an instructor's guide. The objective of the program is to offer basic information to the senior official on the proper perspective of crisis management, the phases of a crisis, the strategic role of the crisis manager, constraints and consequences of a crisis, and crisis management stress. The knowledge and skills learned in the crisis management program offer an increased awareness to the senior official of the importance of emergency preparedness, planning and practice before a crisis occurs.

35831 (GAO/RCED–88-130) **Nuclear health and safety.** General Accounting Office, Washington, DC (USA). Resources, Community and Economic Development Div. 1988. 9p. Available from General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

Many of the Department of Energy's facilities are deteriorating to the point that new facilities or major upgrades are needed to maintain the nation's capability to produce nuclear material. Important safety and environmental concerns have been raised about DOE reactors and other nuclear defense facilities GAO believes that ens of billions of dollars will be needed to rebuild, clean up, and improve safety at DOE installations; DOE has stated that environmental cleanup at DOE facilities could cost as much as $100 billion. At this time, however, it is unclear how, where, and in what time frame these corrective actions will be accomplished.

35832 (INIS-mf–11457(v.1,2) v. 1) **Optimization of radiation protection.** Beninson, D. Canadian Nuclear Association, Toronto, ON (Canada); Comision Nacional de Energia Atomica, Buenos Aires (Argentina). 1985. (CONF-841016–: International conference on occupational radiation safety in mining, Toronto, Ontario, Canada, 15-18 Oct 1984). In *Occupational radiation safety in mining. Proceedings of the international conference (in two volumes).* Order Number DE89619926/JAW. Available from NTIS (US Sales Only), PC A99/MF A01 - OSTI; INIS.

The paper discusses some aspects of the requirements of keeping doses 'as low as reasonably achieveable'. This requirement, called the optimization of radiation protection, is presented as a typical case of Decision Analysis. Special problems encountered in defining the period of integration of collective dose or its coverage in space are also discussed, as well as the effects of uncertainty in the assessments.

35833 (INIS-mf–11457(v.1,2) v. 1) **Removal of airborne thoron (radon) daughters on mine walls and other surfaces by convective deposition and electrostatic plate-out.** Bigu, J. (Department of Energy, Mines and Resources, Elliot Lake, ON (Canada). Elliot Lake Lab.). Canadian Nuclear Association, Toronto, ON (Canada). 1985. (CONF-841016–: International conference on occupational radiation safety in mining, Toronto, Ontario, Canada, 15-18 Oct 1984). In *Occupational radiation safety in mining. Proceedings of the international conference (in two volumes).* Order Number DE89619926/JAW. Available from NTIS (US Sales Only), PC A99/MF A01 - OSTI; INIS.

Experimental data on thoron(radon) daughter plateout phenomena on walls by convective and electrostatic deposition are presented. Experiments were carried out in underground uranium mines and in the laboratory. Measurements were conducted under a wide range of environmental conditions including relative humidity (30-90%), temperature (14-25 degrees C), aerosol concentration ($1x10^3$ - $2x10^5$ cm^{-3}), and air velocity (0-1.2 m/s). Experimentally determined radon and thoron daughter deposition velocities were in the range 0.06-0.6 cm/s. These values are substantially lower than theoretical estimates by several authors on which plate-out calculations are based. The effect of an electrostatic field on the removal of thoron daughters has also been investigated. DC voltages ranging from 0 Volts to ±1000 Volts were applied to aluminum metal mesh electrodes. Measurements show quite a substantial reduction in the thoron daughter Working Level, about a factor 2 to 4, when a voltage between -300 V and -1000 V is applied to the metal mesh.

35834 (INIS-mf–11457(v.1,2) v. 1) **Identification of nonuranium mines which present a radon risk through measurements of exhaust air.** Bernhard, S. (Centre d'Etude sur l'Evaluation de la Protection dans le Domaine Nucleaire, 92 - Fontenay-aux-Roses (France)); Le Gac, J.; Zettwoog, P. Canadian Nuclear Association, Toronto, ON (Canada). 1985. (CONF-841016–: International conference on occupational radiation safety in mining, Toronto, Ontario, Canada, 15-18 Oct 1984). In *Occupational radiation safety in mining. Proceedings of the international conference (in two volumes).* Order Number DE89619926/JAW. Available from NTIS (US Sales Only), PC A99/MF A01 - OSTI; INIS.

The following data were gathered in the measurement campaigns conducted only on the air exhausts of some fifty European Community mines in 1983: identification of the mine, mining method, measurement of radon concentrations at mine entrance and exhaust air, ventilation flowrate at air exhaust point(s), equivalent length developed by the stope-gallery network assigned to each air exhaust of the mine, mean cross-section assigned to the overall network of stopes and galleries of each mine, measurement of potential alpha energy concentrations of radon 222 and radon 220 daughters. These data were processed to meet the following objectives: identification of mines with potential radiological risk, determination by the forecasting model of probable minimum levels of worker exposure to radon 222 daughters, quality assurance of secondary ventilation, identification of convective transfer mechanisms by air or water within the rock.

35835 (INIS-mf–11457(v.1,2), pp. 704) **Air purification techniques for radon daughters in uranium mines.** Pourprix, M. (Centre d'Etude sur l'Evaluation de la Protection dans le Domaine Nucleaire, 92 - Fontenay-aux-Roses (France)); Vendel, J.; Zettwoog, P. Canadian Nuclear Association, Toronto, ON (Canada). 1985. (In French). (CONF-841016–: International conference on occupational radiation safety in mining, Toronto, Ontario, Canada, 15-18 Oct 1984). In *Occupational radiation safety in mining. Proceedings of the international conference (in two volumes).* Order Number DE89619926/JAW. Available from NTIS (US Sales Only), PC A99/MF A01 - OSTI; INIS.

A modified air purifier to filter air was built to reduce radon daughter concentrations in uranium mines, and thus reduce exposure of miners. The main experimental results for the purifiers are presented for several levels: individual purification; secondary ventilation; purification; and primary ventilation purification. The study concentrates on secondary ventilation purification. For this case the electrostatic technique is preferred.

0550 Safeguards, Inspection, and Accountability

35836 (CONF-890565–7) **Implementation of isotope correlation technique for safeguards.** Persiani, P.J.; Bucher, R.G. Argonne National Lab., IL (USA). 1989. 8p. Sponsored by DOE Nuclear Energy. DOE Contract W-31109-ENG-38. From 11. annual ESARDA symposium on safeguards and nuclear materials management; , Luxembourg; 30 May - 1 jun 1989. Order Number DE89013286/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The isotopic correlation technique (ICT) is based on the fundamental physics principle that the isotopic compositions of nuclear material in the fuel cycle systems contain information regarding the design and history of nuclear material flow from fuel fabrication, reactor operation, and through input to the reprocessing plant. Isotopic Correlation in conjunction with the gravimetric (or Pu/U) method for mass determination can be developed to provide an independent in-field verification of the reprocessing input accountancy at the dissolver and/or accountancy stage of the reprocessing plant. The Argonne National Laboratory program in isotope correlation techniques is based on three-dimensional reactor physics calculations of characteristic geometries/composition in each reactor class. 10 refs., 1 fig., 3 tabs.

35837 (IAEA-INFCIRC–360) **Agreement of 27 September 1988 between the International Atomic Energy Agency and the Government of India for the application of safeguards in connection with the supply of a nuclear power station from the Union of Soviet Socialist Republics.** International Atomic Energy Agency, Vienna (Austria). Jan 1989. 14p. Order Number DE89620442/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The full text of the Agreement of 27 September 1988 between the Agency and the Government of India for the application of safeguards in connection with the supply of a nuclear power station composed of two pressurized light water reactors, each of 1000 MW(e) from the Union of Soviet Socialist Republics is reproduced.

35838 (LA-UR–89-1558) **LAVA [Los Alamos Vulnerability and Risk Assessment] and classical risk analysis.** Smith, S.T. Los Alamos National Lab., NM (USA). 1989. 9p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-8906141–1: Computer security risk management model builders workshop, Ottawa, Canada, 20-22 Jun 1989). Order Number DE89013210/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

LAVA (the Los Alamos Vulnerability/Risk Assessment system) is a three-part systematic approach to risk assessment that can be used to model risk assessment for a variety of application systems such as computer security systems, communications security systems, information security systems, and others. The first part of LAVA is the mathematical methodology based hierarchical systems theory, fuzzy systems theory, decision analysis, utility theory, and cognitive science; clear relationships exist between LAVA's approach and classical risk analysis. The second part, written for a large class of personal computers, is the general software engine that implements the mathematical risk model. The third part is the application data sets, each written for a specific application system; all application-specific information is data. Application models are knowledge-based expert systems to assess risks in application systems comprising sets of threats, assets, undesirable outcomes, and safeguards. The safeguards system model is in three segments: sets of safeguards functions for protecting the assets from the threats by preventing or ameliorating the undesirable outcomes, sets of safeguards subfunctions whose performance determines whether the function is adequate and complete, and sets of issues, appearing as interactive questionnaires, whose measures define both the weaknesses in the safeguards system and the potential costs of undesirable outcome occurrence. 29 refs.

DOE Contract W-7405-ENG-36. (CONF-890736–30: 30. annual meeting of the Institute of Nuclear Materials Management, Orlando, FL, USA, 9-12 Jul 1989). Order Number DE89014314/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Process monitoring has been proposed as a safeguards measure to ensure that a facility is operating as designed, or as a surveillance measure to ensure that material is not removed from the facility in an undeclared manner. In a process-monitoring system, the facility operator monitors process operations such as tank levels, densities, and temperatures; process flows; and physical parameters such as valve positions to ensure that the operations performed are both desired and required. At many facilities (for example, Idaho), the process-monitoring system is also an important safety feature to prevent criticality. Verifying facility design is necessary for application of safeguards in a reprocessing plant. Verifying all pipes and valves through comparison of blueprints with the as-built facility is an almost impossible task with the International Atomic Energy Agency's limited inspection resources. We propose applying process monitoring for international safeguards facility design verification. By carefully selecting process-operating variables, it may be possible to verify that plant flows are as described and that key measurement points are not bypassed. 8 refs.

35840 (LA-UR–89-2047) **Unique applications of tamper indicating devices.** Erkkila, B.H. Los Alamos National Lab., NM (USA). 1989. 5p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890736–29: 30. annual meeting of the Institute of Nuclear Materials Management, Orlando, FL, USA, 9-12 Jul 1989). Order Number DE89014310/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Various organizations at Los Alamos have used tamper indicating devices (TID) to help control nuclear materials for several years. During the past year a formal documented TID program has been developed to be implemented throughout the Laboratory. Special needs of all organizations have been incorporated into the program. Applications vary from waste containers to unique configurations of special nuclear materials (SNM). Several examples of these applications will be discussed.

35841 (NUREG/CR–4934) **Closeout of IE Bulletin 83-06: Nonconforming materials supplied by Tube-Line Corporation**

Facilities at Long Island City, New York; Houston, Texas; and Carol Stream, Illinois. Dean, R.S.; Foley, W.J.; Hennick, A. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Operational Events Assessment; Parameter, Inc., Elm Grove, WI (USA). May 1989. 37p. Sponsored by Nuclear Regulatory Commission. (PARAMETER/IE–169). Available from NTIS, PC A03/MF A01 - OSTI.

Documentation is provided in this report for the closeout of IE Bulletin 83-06 regarding nonconformities of certain materials which were obtained directly or indirectly from the Tube-Line Corporation (T-L) for use in safety-related systems. Closeout is based on the implementation and verification of four (4) required actions by licensees and holders of construction permits of nuclear power reactor and nuclear fuel facilities. From evaluation of responses and NRC/Region inspection reports, it is concluded that the concerns of the bulletin have been resolved. The bulletin is closed for all of the 120 power reactor facilities and for both of the two nuclear fuel facilities to which it was issued for action. Background information is supplied in the Introduction and Appendix A. 3 refs., 5 tabs.

35842 (POEF–2007) **Long-range health and safety management plan, fiscal years 1989–1995.** Martin Marietta Energy Systems, Inc., Piketon, OH (USA). Jun 1989. 136p. Sponsored by DOE Nuclear Energy. DOE Contract AC05-76OR00001. Order Number DE89014234/JAW. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

This Health and Safety Long Range Plan (LRP) analyzes health and safety programs at the Portsmouth Gaseous Diffusion Plant (PORTS) and details areas of strength and plans for overcoming noted deficiencies (existing and anticipated). Major areas of focus are health physics, industrial hygiene, nuclear criticality safety, nuclear facility safety, transportation safety, fire protection, industrial safety, emergency preparedness, and occupational medicine.

35843 (RFP–4296) **TRIFID [TRansuranic Isotopic Fraction Interrogation Device]: A second generation plutonium isotopic analysis system.** Fleissner, J.G.; Coressel, T.W.; Freier, D.A.; Macklin, L.L. Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant. 1989. 29p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP03533. (CONF-890736–13: 30. annual meeting of the Institute of Nuclear Materials Management, Orlando, FL, USA, 9-12 Jul 1989). Order Number DE89014174/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The TRIFID (Transuranic Isotopic Fraction Interrogation Device) system is a second generation plutonium isotopic analysis system which incorporates many new and unique features in the area of isotopic data acquisition and isotopic analysis instrument consisting of a Canberra Series 95-MCA interfaced to a Compaq 386 computer. The entire TRIFID software package, including MCA communications and isotopic analysis routines, was developed using the C programming language. Extensive use has been made of user friendly screens and menus for ease of operation and training and to facilitate use by technical level operators. Automated TRIFID features provide for MCA/ADC setup and acquisition, spectral storage, isotopic analysis, and report generation. One unique feature of the TRIFID system design allows it to be pre-programed for an entire day's counting. The isotopic analysis module (EPICS) contains an expert system formalism which is used to detect and assay for spectral interferences, and to automatically adjust peak fitting constraints based on spectral intensity variations. A TRIFID system has been in operation in a production laboratory at the Rocky Flats Plant since September 1988. Marked decreases in training and hands-on operation time have been achieved in comparison to the older, preceding isotopic systems. 2 refs., 3 figs.

35844 (RFP–4307) **Use of nuclear material control specialists for material surveillance.** Mullet, R.D. Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant. 1989. 4p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP03533. (CONF-890736–14: 30. annual meeting of the Institute of Nuclear Materials Management, Orlando, Florida, USA, 9-12 Jul 1989). Order Number DE89014176/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The new Control and Accountability of Nuclear Material Department of Energy (DOE) Order 5633.3 states that "each facility shall establish a graded safeguard program for monitoring nuclear materials and detecting unauthorized activities or anomalous conditions." Rockwell developed a new position description and hired Nuclear Materials Control (NMC) Specialists as a part of the graded materials surveillance program at Rocky Flats (RF). The NMC Specialists provide material surveillance in Material Access Areas (MAA) during all shifts when operations are in progress. By design, NMC Specialists do not handle special nuclear materials (SNM) in accordance with separation of duties and responsibilities requirements. In support of the effort to assure SNM are accessed only by authorized personnel, the NMC Specialist can serve as the second person for those activities that require two persons such as accessing storage areas containing SNM and SNM transfers between MAAs. NMC Specialists respond immediately to material control alarms, assess and document the nature of the alarm, and assist management with resolution. They perform daily administrative inventory checks to determine the integrity of the inventory and advise management daily of the results. NMC Specialists perform confirmation and coordinate verification measurements on the inventory each month utilizing statistical sampling plans. The purpose of this paper is to describe how utilization of NMC Specialists has enhanced the material surveillance program at RF.

35845 (SAND–89-1110C) **Modular economical PC-based alarm display system.** Clark, C.M.; Christoffersen, D.A. Sandia National Labs., Albuquerque, NM (USA). 1989. 6p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-890736–21: 30. annual meeting of the Institute of Nuclear Materials Management, Orlando, Florida, USA, 9-12 Jul 1989). Order Number DE89014479/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Historically, large scale safeguards alarm and communication systems have required the expensive computational power of a mainframe of midsize computer. Due to the widespread availability and reduced cost of PC-based technology, this class of machine is a much preferred solution. This paper will discuss a development program integrating this technology with inexpensive local area network (LAN) hardware to support (1) many touch panel based operator graphics consoles, (2) redundant LAN communications, (3) fault-tolerant LAN communication, (4) redundancy in subsystem failure, (5) modularity in design, (6) fault-tolerant video communication, (7) inexpensive PC-based video annotation and switcher design, (8) inexpensive video replay capability, (9) use of fiber optic communication media, (10) distributed parallel processing, and (11) minimized overall system cost. The Intel BitBus architecture was selected for network communications between PC CPUs. The network supports both fiber optic and copper media and insures message integrity/receival. Custom boards have been developed to transform PCs modular expandable routing switchers with video presence detection and annotation. 1 fig.

35846 (SAND–89-1111C) **Argonne Unified Safeguard: An integrated materials monitoring/tracking and accounting system.** Henslee, S.P.; Jackson, B.G.; Roybal, J.A.; Garcia, B. Sandia National Labs., Albuquerque, NM (USA). 1989. 11p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-890736–19: 30. annual meeting of the Institute of Nuclear Materials Management, Orlando, Florida, USA, 9-12 Jul 1989). Order Number DE89014481/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Current work in the area of integrated materials monitoring/tracking and accounting at Argonne National Laboratory-West (ANL-W) has resulted from the development of materials accounting system by Los Alamos National Laboratory (LANL) and a demonstrated personnel and materials tracking system by Sandia National Laboratories (SNL). The integration of these two systems has culminated in the current system effort which is called the ARGonne Unified Safeguard (ARGUS) system. The ARGUS system is made up of three major components. These components perform the functions of observing all container movements, authorized materials access approval, initiation and receipt of materials transfers, and perform materials accounting for the facility. ARGUS system benefits can be summarized through system capabilities as follows: near real-time accountability, full traceability of materials access and transfer, enforcement of approved personnel access to materials,

electronic confirmation of materials surveillance procedures during materials access and transfers, continuous surveillance of all material not directly involved in the manufacturing process, transfer and receipt, and automatic notification to security for identified anomalies. This paper will concentrate on the overall ARGUS system, its operational impacts and advantages. 2 refs., 2 figs.

35847 (SAND–89-1601C) **The assess facility descriptor module.** Jordan, S.E.; Winblad, A.; Key, B.; Walker, S.; Renis, T.; Saleh, R. Sandia National Labs., Albuquerque, NM (USA). 1989. 10p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-890736–11: 30. annual meeting of the Institute of Nuclear Materials Management, Orlando, Florida, USA, 9-12 Jul 1989). Order Number DE89014070/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The Facility Descriptor (Facility) module is part of the Analytic System and Software for Evaluating Safeguards and Security (ASSESS). Facility is the foundational software application in the ASSESS system for modelling a nuclear facility's safeguards and security system to determine the effectiveness against theft of special nuclear material. The Facility module provides the tools for an analyst to define a complete description of a facility's physical protection system which can then be used by other ASSESS software modules to determine vulnerability to a spectrum of insider and outsider threats. The analyst can enter a comprehensive description of the protection system layout including all secured areas, target locations, and detailed safeguards specifications. An extensive safeguard component catalog provides the reference data for calculating delay and detection performance. Multiple target locations within the same physical area may be specified, and the facility may be defined for two different operational states such as dayshift and nightshift. 6 refs., 5 figs.

35848 (SAND–89-1603C) **The ASSESS Neutralization Analysis module.** Paulus, W.K.; Jordan, S.E.; Moore, M.; Mondragon, J. Sandia National Labs., Albuquerque, NM (USA). 1989. 14p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-890736–12: 30. annual meeting of the Institute of Nuclear Materials Management, Orlando, Florida, USA, 9-12 Jul 1989). Order Number DE89014801/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The ASSESS Neutralization Analysis module (Neutralization) is part of Analytic System and Software for Evaluation of Safeguards and Security, ASSESS, a vulnerability assessment tool. Neutralization models a fire fight engagement security inspectors (SIs) and adversaries. Results are based on probability of neutralization, P(N), which estimates the likelihood that SIs will win, given that SIs interrupt the attackers and begin an armed engagement. The calculating engine of the module is the Brief Adversary Threat Loss Estimator, BATLE. Engagements can have as many as thirty combatants on a side. Reinforcements may be introduced or combatant characteristics may be changed as many as ten times in one engagement. Inputs may be made with or without programmed guidance to the user. Combatant characteristics come from a modifiable library. Seven different characteristics can be independently specified for each combatant. Graphs of time distributions and studies of the sensitivity of P(N) to any combatant characteristic of either SIs or adversaries can be requested. Output files from Neutralization are used by Outsider Analysis to produce probability of security system win. 4 refs., 12 figs., 2 tabs.

35849 (SAND–89-1604C) **The Outsider interruption algorithm.** Snell, M.; Bingham, B. Sandia National Labs., Albuquerque, NM (USA). 1989. 12p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-890736–8: 30. annual meeting of the Institute of Nuclear Materials Management, Orlando, FL, USA, 9-12 Jul 1989). Order Number DE89014799/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Outsider Analysis (Outsider) module is part of the Analytic System and Software for Evaluation of Safeguards and Security (ASSESS). Outsider and the ASSESS Facility Descriptor (Facility) module together supercede the Systematic Analysis of Vulnerability to Intrusion (SAVI) PC software package. Outsider calculates P(I), the probability that outsiders are interrupted during an attack on a facility by security forces at the facility, and P(W), the probability of security system win. SAVI exhaustively examines every possible path to find the ten most vulnerable paths. Exhaustive search is adequate if the number of paths to examine is small, but moderately complex facilities can have millions of paths, making exhaustive search too slow for practical purposes. Outsider has two new algorithms that generate paths in order of vulnerability, finishing in a fraction of the time required by SAVI. The new Outsider algorithms make containment analysis easier for analysts than ever before. We describe the new algorithms and show how much better they perform than the SAVI exhaustive search algorithm. 6 refs., 5 figs., 2 tabs.

35850 (SAND–89-1605C) **A demonstration of ASSESS: Analytic System and Software for Evaluating Safeguards and Security.** Matter, J.C.; Al-Ayat, R.A.; Cousins, T.D. Sandia National Labs., Albuquerque, NM (USA). 1989. 6p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-890736–10: 30. annual meeting of the Institute of Nuclear Materials Management, Orlando, Florida, USA, 9-12 Jul 1989). Order Number DE89014803/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This paper demonstrates the use of the Analytic System and Software for Evaluating Safeguards and Security. ASSESS is an integrated approach for evaluating the effectiveness of safeguards against theft of special nuclear material by different types of adversaries: insiders, outsiders, and colluding insiders and outsiders. ASSESS consists of six modules: System Manager, Facility Descriptor, Insider Analysis, Outsider Analysis, Neutralization Analysis, and Collusion Analysis. This paper introduces the modules, describes their scope, and highlights the interactions among them. Separate papers will provide detailed discussion and demonstration of each of the modules. The ASSESS code runs on the IBM PC family of computers with 640K RAM, the DOS operating system, and Microsoft Windows. The Windows environment provides a very efficient and convenient graphics user interface as well as drivers for many types of output devices. ASSESS is being developed jointly by Lawrence Livermore National Laboratory and Sandia National Laboratories under the sponsorship of the Department of Energy (DOE) Office of Safeguards and Security. The first version of the ASSESS code was delivered to DOE/OSS in March 1989. 7 refs., 4 figs.

35851 (SAND–89-1645C) **Target cueing and tracking system for safeguards and security.** Darnell, R.A.; Eilers, D.L.; Schnetzer, E.E. Sandia National Labs., Albuquerque, NM (USA). 1989. 7p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-890736–31: 30. annual meeting of the Institute of Nuclear Materials Management, Orlando, FL, USA, 9-12 Jul 1989). Order Number DE89013923/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

There are many Safeguards applications which have a need for a reliable system that uses state-of-the-art processing techniques to detect and track targets moving through a scene. A general purpose Target Cueing and Tracking System (TCATS), which is independent of the application and the user interface, is under development. The TCATS algorithms were developed and evaluated with commercially available image processing boards and a VME bus based microcomputer. The TCATS algorithms have successfully demonstrated a high detection capability and the ability to ignore exterior environmental conditions, such as cloud shadows moving through the scene, snow, blowing dust, rain, and moderate camera motion. These algorithms remove camera motion. These algorithms remove camera motion and perform target detection and tracking at near real time. The algorithms can handle many targets and retain the identity of each object from one frame to the next. Special ruggedized hardware is also under development to reduce the size, cost, and power consumption, and to increase the processing rate, reliability, and environmental operating capability of the TCATS. Field evaluations are underway specifically for Exterior Fixed Site Security applications. Testing includes nuisance alarm data gathering and detection capability evaluation of human targets crossing perimeter zones. This paper describes the detection and tracking techniques, custom hardware, and future development plans for the TCATS. 5 refs., 9 figs.

When used for irradiation of solid material, ion beams with an energy of less than several hundreds of electron volts give a sputtering ratio of less than unity, making it possible to perform deposition by using the ion beams. Ions have a potential energy which is larger by the ionization energy than other particles and has a kinetic energy far larger than the thermal energy. The ion beam deposition process can work very effectively in the field of thin film formation. Various advantages obtainable by applying the process to thin film formation are described, focusing on the formation of thin film of nitride and oxide of aluminum and silicon by an ion beam deposition apparatus consisting of a microwave ion source and an ICB system, and the formation of carbon film by carbon anion beams supplied by a mass-separated anion beam deposition apparatus. Major advantages of using ion beams are: increase in chemical reactivity to permit film formation at lower temperatures; accurate control of the amount of reactive gas particles to permit control of the composition; availability of the effect of kinetic energy of ions to permit control of crystalinity; and synthesis of impurity-free compounds to permit the formation of pure film. 35856 (PNL–6934) **US Department of Energy radioisotope customers with summary of radioisotope shipments, FY 1988.** Van Houten, N.C. Pacific Northwest Lab., Richland, WA (USA). Jun 1989. 47p. Sponsored by DOE Energy Research. DOE Contract AC06-76RL01830. Order Number DE89014583/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

Pacific Northwest Laboratory (PNL) prepared this edition of the radioisotope customer list at the request of the Office of Health and Environmental Research (ER-73), Office of Energy Research, US Department of Energy (DOE). This is the 25th report in a series dating from 1964. This report covers DOE radioisotope sales and distribution activities by its facilities to domestic, foreign and other DOE facilities for FY 1988. The report is divided into five sections: radioisotope suppliers, facility contacts, and radioisotopes or services supplied; a list of customers, suppliers, and radioisotopes purchased; a list of radioisotopes purchased cross-referenced to customer numbers; geographic locations of radioisotope customers; and radioisotope sales and transfers – FY 1988. Radioisotopes not previously reported in this series of reports were argon-37, arsenic-72, arsenic-73, bismuth-207, gadolinium-151, rhenium-188, rhodium-101, selenium-72, xenon-123 and zirconium-88. The total value of DOE radioisotope sales for FY 1988 was $11.1 million, an increase of 3% from FY 1987.

35857 (EC/WTC–1989) **Creating fuel oil from sewage sludge.** Environment Canada, Burlington, ON (Canada). Wastewater Technology Centre. [1989]. 6p. (In English and French). (MICROLOG–88-04804). Available from Environment Canada, Library Services, Terrasses de la Chaudiere, 10 Wellington St., Ottawa, ON, Canada K1A 0H3; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Environment Canada's Wastewater Technology Centre at Burlington, Ontario has developed new cost-efficient processes to deal with wastewaters produced by industry and municipalities. This pamphlet gives an overview of a process originally developed by Tubingen University in Germany in which dried municipal sludge is heated to 300-350^{0}C in an oxygen-free environment and converted to fuel oil, char, reaction water, and noncondensable gas, collected separately. The economic and environmental advantages of the system are described. 1 fig.

35858 (PB–89-166722/XAB) **Wood sugars to energy-intensive organic chemicals: Phase 1. Final report.** Belfort, G.; Dziewulski, D.M.; Nauman, E.B. Rensselaer Polytechnic Inst., Troy, NY (USA). Jul 1985. 84p. Available from NTIS, PC A05/MF A01.

This report describes research into the conversion of wood sugars, derivable from abundant New York State hardwoods, to high-value petrochemicals. The current phase of research emphasized the production of levo-2,3 butanediol by fermentation of glucose using Bacillus polymyxa. A key technology, use of ceramic hollow fibers for recycle of live cells, was demonstrated in the feasibility study. Butanediol is one of several possible products, such as glycerol, succinic acid, and acetic acid, that are now produced from petroleum or natural gas, but which could be produced from wood. The study concludes, on a preliminary basis, that production of butanediol from wood-derived glucose is economically feasible. Further development is needed to make the process continuous and optimize various steps including product extraction. Future work will focus on development of a continuous reactor and the use of a lower-cost wood sugar, xylose, as the feedstock.

35859 (PB–89-167217/XAB) **Conversion of methanol over zeolite ZSM-5.** Howden, M.G. Council for Scientific and Industrial Research, Pretoria (South Africa). Jul 1987. 22p. (CSIR-CENG–654). Available from NTIS, PC EE04/MF E04.

Summary in Afrikaans. North American Continent sales only.

Methanol can be derived from either coal or natural gas. There is great interest in South Africa in the production of synthetic fuels from such methanol, particularly when zeolite ZSM-5 is used as the catalyst. This report reviews the various parameters that control the conversion of methanol into the different types of liquid fuel.

35860 (PB–89-173199/XAB) **Identification and characterization of reaction steps and enzyme catalysts involved in the conversion of acetate and methyl groups to methane. Final report, October 1984-October 1987.** Stadman, T.C.; Grahame, D.A. National Heart, Lung, and Blood Inst., Bethesda, MD (USA). Feb 1988. 38p. Available from NTIS, PC A03/MF A01.

The overall objective of the research is to identify the enzymatic steps involved in the reduction to methane of the methyl group of acetate and certain other one-carbon compounds (e.g., methanol, formate, CH_3-SCoM, or CH_3-B12). Studies on the mechanism of action of the enzymes involved would ultimately provide information which could be used in constructing synthetic or semi-synthetic catalysts for industrial purposes, and would be extremely helpful in the design of methods to improve the efficiency and reliability of bioconversion processes. The initial goals were to develop procedures by which the enzymes suspected to be involved can be purified in sufficiently large quantities for biochemical studies of their structure and function. The enzymatic components were to be characterized in detail such that experiments could be undertaken to determine their exact roles and mechanisms of action in methanogenesis. This course of action was pursued with the two enzymes carbon monoxide dehydrogenase and Co-methylcobamide:2-thioethanesulfonate methyltransferase.

35861 (PB–89-178784/XAB) **Electrochemical conversion of C(1) molecules. Final report, February 1, 1986-December 31, 1988.** Sammells, A.F.; Cook, R.L.; Wessels, B.W. Eltron Research, Inc., Aurora, IL (USA). Feb 1989. 173p. Available from NTIS, PC A08/MF A01.

This report identifies new efficient systematic electrocatalysis strategies for the electrochemical and photoelectrochemical (PEC) generation of hydrogen or hydrogenated inorganic substrate molecules to give useful gaseous fuels. Selected electrocatalysts would then be utilized in novel cell configurations. Basic insight gained would lead to new approaches for direct methane activation leading to more valuable products.

35862 (SU–7906) **Study of the conversion of lignocellulosic (aspen) materials to liquid fuels and chemicals.** Pepper, J.M.; Eager, R.L.; Mathews, J.F. Saskatchewan Univ., Saskatoon, SK (Canada). 1979. 31p. (CONF-7906193–: Chemical Institute of Canada annual conference, Vancouver, Canada, 1 Jun 1979;CE–02419). Available from CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $3.40 CAN minimum, plus $0.25/p after 10 pages.

Studies were completed on the use of the small-scale semi-continuous reactor whereby lignocellulosic materials may be converted into a fuel oil. Changes in design and operation were made and further data obtained as a result of studies of the following parameters: pretreatment with sulfuric acid, operating pressure, presence or absence of CO, and nature of feedstock. The major study has centered around the design, construction and testing of a small-scale continuous reactor whose operation was based upon the use of a newly designed screw unit to compress and deliver the wood meal to the reactor site. Chemical studies on oils were obtained from both wood and cellulose. Semi-continuous reactor experiments were run to demonstrate that proto oil could be made continuously under conditions similar to batch runs, and to outline the ranges of the process variable in which satisfactory operation can be maintained for extended periods of time. 7 refs., 4 figs., 5 tabs.

35863 (PB–89-166714/XAB) **Recycling of cellulose enzyme complex after cellulose hydrolysis. Final report.** Ciesceri, L.S. Rensselaer Polytechnic Inst., Troy, NY (USA). Mar 1985. 46p. Available from NTIS, PC A03/MF A01.

This report describes the development of a low-cost process for the recycling of enzymes used in cellulose hydrolysis. The enzymes can be used in an advanced technology to convert cellulose, a component of wood and paper, to sugar for the production of fuel ethanol. The market for fuel ethanol, used as an octane booster in gasoline, is growing. New York State has an abundant resource base in its forests and paper wastes that could be used to produce fuel ethanol. The enzymes used in the process are expensive, however, and recycling is important to control costs. This project resulted in the development of a simple, inexpensive method of recycling the active components of the enzymes.

35864 **Cost goals for biofuels technologies.** Gaines, L.L. (Argonne National Lab., 9700 South Cass Avenue, Argonne, IL (US)); Flaim, S.J. v.v of Energy from biomass and wastes XI. Klass, D.L. Institute of Gas Technology, Chicago, IL (1988). (CONF-870364–: 11. IGT conference on energy from biomass and wastes, Orlando, Florida, USA, 16-20 Mar 1987).

Federally funded energy research seeks to demonstrate that alternative fuels can be produced and then to induce private sector involvement by showing that they can be produced profitably. Prices for fossil fuels may be used as cost goals for biofuels to determine when profitability may be achieved. Achieving equality with fossil fuel prices drives out the highest-cost sources of supply and enables initial market penetration; as costs decrease, biofuels can potentially gain a greater market share. However, achieving competitive costs is not a sufficient condition for success unless prices of conventional substitutes are expected to rise. Cost goals are used for research planning purposes, as a common denominator to allow comparisons among many biofuels options. Application of standard investment criteria to biofuels R and D would require that benefits from their use pay back research costs. These benefits must be discounted because they are realized in the future. Furthermore, realization of future savings is uncertain, so risks must be accounted for. Research may be justified if the expected value of the discounted benefits is greater than the discounted cost of the research. Cost goals satisfying this condition might be substantially lower than projected fuel prices. This paper examines recent fossil fuel price projections and discusses the challenges biofuels research faces just to produce competitive products.

35865 (ETDE/CA-MS–8709) **Whitehorse efficient woodheat demonstration.** Simons, C.A.; Christiansen, P.D.; Pritchett, L.C.; Beyerman, G.A. Department of Energy, Mines and Resources, Ottawa, ON (Canada). 1987. 294p. (MICROLOG–89-02263). Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

To determine the effectiveness of the new woodheat technologies under in-home conditions, the City of Whitehorse, Energy, Mines and Resources Canada, and the Government of the Yukon funded a demonstration of those technologies not previously evaluated under in-home conditions. The study was designed to demonstrate the effectiveness of these technologies in reducing the impact of residential woodheat emissions on ambient air quality; reducing the risk associated with chimney fires and safety of operation in the home; and improving the energy efficiency of residential woodheating. These objectives were to be achieved by quantifying the emission characteristics of both coventional and new residential woodheat technologies (integral catalytic woodstoves, catalytic add-on retrofit devices, low emission non-catalytic woodstoves, and double wall flue pipe) under in-home conditions; measuring the creosote build-up in flue pipes and chimneys of the test stoves; comparing results from this study with other suitable studies; evaluating the impact of in-home woodburning operator practices on woodstove performance; evaluating the percentage of time catalysts were at lightoff conditions; and evaluating the effect on woodstove performance and particulate emissions of using the two types of wood commonly available in Whitehorse area (firekilled lodgepole pine, and seasoned white spruce). Nine one-week particulate emission sampling periods were conducted in 14 homes, half the time using the conventional woodstove and half using the new appliances. Results and user comments are given for each of the new technologies, as well as the conventional appliances. 14 refs., 15 figs., 42 tabs.

35866 (NME–1986, pp. 81-88) **Woodchip production and transporation in Newfundland. Overview.** Strong, W. (Highlands Contracting Ltd., Gander, NF, Canada). Mercy Hospital and Medical Center, Chicago, IL (USA). 1986. (CONF-8611290–: Wood and peat energy conference, Gander, Canada, 17-19 Nov 1986;MICROLOG–89-01972). In *The power of alternative. Energy from wood and peat.* Available from Dept. of Mines and Energy, PO Box 4750, St. John's, NF, Canada A1C 5T7; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Wood chip production began in Newfoundland in 1978 with the trial of the Morbark 22 Chiparvester at Price Newfoundland Ltd. (now Abititbi-Price). Approximately 7,000 tonnes were produced. That operation has not stopped production, but many changes have been made. Since then, several other consumers have started to use wood chips as a source of fuel. The names and yearly capacities of present woodchip users are as follows: Abitibi-Price (Grand Falls), 50,000 tonnes; Corner Brook Pulp and Paper, 25,000 tonnes; Gander Hospital, 3,200 tonnes; Nfld. Hardwoods, 5,000 tonnes; 1985 total, 83,200 tonnes. 1 fig.

35867 (NME–1986, pp. 43-55) **Wood-fired boiler feasibility study. Western Memorial Regional Hospital Corner Brook, Newfoundland.** McDougall, A.R. (ShawMont Newfoundland Ltd., St. John's, NF, Canada). Mercy Hospital and Medical Center, Chicago, IL (USA). 1986. (CONF-8611290–: Wood and peat energy conference, Gander, Canada, 17-19 Nov 1986;MICROLOG–89-01972). In *The power of alternative. Energy from wood and peat.* Available from Newfoundland. Dept. of Mines and Energy, PO Box 4750, St. John's, NF, Canada A1C 5T7; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The purpose of this report is to investigate the economic feasibility of converting to a wood fuel energy source, and to develop a preliminary design of a wood fired heating system based on system information proposed by equipment manufacturers. Energy requirements are discussed. The peak load at the hospital is 7.3 MW, however, this seldom occurs. There are two approaches that may be taken in selecting and sizing a wood-fuel heating system. The first method is to select a system with sufficient capacity to meet the highest anticipated load requirement. The second approach is to undersize the wood fired system, thus requiring an auxiliary system. Preliminary design, wood availability and cost are discussed; the choice is made to burn wet woodchips with an assumed cost of $34/ton. In spite of the sharp drop of oil prices, the true payback period of the new installation is 8 years. It is recommended that the base load system be installed as indicated in the preliminary design; it is also recommended that the installation be made under a single turn-key type arrangement with an equipment supplier. 2 figs., 2 tabs

35868 (NME–1986, pp. 19-28) **Woodchip conversion project report. Newfoundland Hardwoods Clarenville plant and Clarenville district vocational school.** Mills, M. (Acres International Ltd., St. John's, NF, Canada). Mercy Hospital and Medical Center, Chicago, IL (USA). 1986. (CONF-8611290–: Wood and peat energy conference, Gander, Canada, 17-19 Nov 1986;MICROLOG–89-01972). In *The power of alternative. Energy from wood and peat.* Available from Dept. of Mines and Energy, PO Box 4750, St. John's, NF, Canada A1C 5T7; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

For the Newfoundland Hardwoods Clareville plant, the design of the new boiler system and tender call were carried out in 1983, with the project completed in September 1984. The operation consists of a fuel dump station, a chip screen, a fuel storage and a new 2.94 MW completely automatic Bell boiler capable of producing 454 kg/h of steam by burning whole tree chips with a moisture content of 45%. The total project cost, including engineering, was $587,500, with anual savings of $120,000. The shared financing of this project is discussed. On the other hand, a 0.294 MW system was designed, for the Clareville District Vocational School, where the boiler, controls and fuel storage were completely enclosed in a portable building with the fuel dump station as a separate add-on package. In the design of the boiler, which was to be low pressure hot water, the daily use and peak loads were taken into consideration. The few data available since delivery in late 1985 indicate a saving over oil in the range of 40%. The shared financing of this project is also discussed. Recommendations are made for future systems. 3 figs.

35869 **Glucose yields from the solvolysis of wood and pure cellulose by anhydrous Hydrogen Fluoride vapor.** Rorrer, G.L. (MSU-DOE Plant Research Lab., Michigan State Univ., East Lansing, MI (US)); Ashour, S.S.; Hawley, M.C.; Lamport, D.T.A. v.v of Energy from biomass and wastes XI. Klass, D.L. Institute of Gas Technology, Chicago, IL (1988). (CONF-870364–: 11. IGT conference on energy from biomass and wastes, Orlando, Florida, USA, 16-20 Mar 1987).

The solvolysis of Bigtooth Aspen wood and pure cellulose (filter paper) by anhydrous Hydrogen Fluoride (HF) vapor was investigated. Each substrate was exposed to a 100% HF vapor stream at 1.0 atm and 27^{0}C to 77^{0}C for a given reaction time. The water-soluble reaction products were then post-hydrolyzed in 2 N trifluoracetic acid for 1 h at 121^{0}C. With this two-step hydrolysis, maximum glucose yields of 85% from wood and 94% from pure cellulose were obtained. HPLC analysis of the water-soluble reaction products obtained before post-hydrolysis revealed that glucose and glucosyl fluoride repolymerized to oligomers during vapor-phase HF solvolysis of cellulose. The oligosaccharide product distribution was dependent on reaction time, temperature, and sample water content.

13 HYDRO ENERGY

35870 (OME–1988, pp. 7) **Build-operate-transfer concept. A case history from Turkey.** Portfors, E.; Lampa, J.; Even, F. Ontario Ministry of Energy, Toronto, ON (Canada). 1988. (CONF-880711–: Small hydro '88: international conference and trade show, Toronto, Canada, 4-9 Jul 1988;MICROLOG–89-02657;CE–02581). In *Small hydro '88. An international conference and trade show. Proceedings, vol. 2.* Available from Ontario Ministry of Energy, Communications Services Group, 62 Wellesley St., West, Main Floor, Toronto, ON, Canada M7A 2B7; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Turkey has recently found a solution to the problem of investment financing called the Build-Operate-Transport (BOT) formula. It

involves foreign entrepreneurs taking a share in a company established to build and operate a project. The entrepreneurs will be able to repatriate outstanding loan repayments, including their share of earnings from equity holdings. Once the loans have been repaid, the joint venture is dissolved and the ownership of the facility is transferred to the host government or public utility, which continues its operation. The Tortum 2 hydroelectric project in northeastern Turkey is described. A head of 87 m was developed. During the feasibility study, several improvements were implemented. The installed capacity was reduced from 18 MW to 11 MW, with two 5.5 MW vertical shaft Francis turbines. This maximized the return on investment, as the third unit in the 18 MW scheme had a load factor of 0.35. Unfortunately, it is not until approximately the year 2000 that the required selling price will fall below the BOT guidelines' stipulated limit of 60% of the Turkish Electricity Authority selling price. 4 figs.

35871 (OME–1988, pp. 9) **Andhi Khola Hydel and Rural Electrification Project (AHREP) Nepal. Low cost hydropower with maximum local training.** Francis, M. Ontario Ministry of Energy, Toronto, ON (Canada). 1988. (CONF-880711–: Small hydro '88: international conference and trade show, Toronto, Canada, 4-9 Jul 1988;MICROLOG–89-02657;CE–02581). In *Small hydro '88. An international conference and trade show. Proceedings, vol. 2.* Available from Ontario Ministry of Energy, Communications Services Group, 62 Wellesley St., West, Main Floor, Toronto, ON, Canada M7A 2B7; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

AHREP is a project of United Mission to Nepal financed by Norwegian Government Aid under agreement with the Government of Nepal. Construction began in 1983 and is due to be finished in 1990. High speed of construction was not one of the objectives of the project; it was considered more important to use local resources and to implement the project in such a way that it could be replicated elsewhere in Nepal. The capacity of the power plant is 5 MW. Because of the long loop of the Andhi Khola river, the power plant is able to exploit a head of 250 m. It is a run of the river plant with daily storage to be provided during the dry season. Water is taken off through a side intake with undersluice into a gravel trap, then via an open canal to a sand trap; the 1.3 km long headrace tunnel takes water through the 300 m high ridge dividing the valleys of the Andhi Khola and Kali Gadaki valleys; the penstock runs in a vertical shaft which also provides access to the underground powerhouse, and the 1 km long tailrace tunnel discharges water form the powerhouse into the Kali Gadaki. Rural electrification is an important aspect of the project as are the promotion of forestry and other rural industries and the production of drinking water. Water from the headrace tunnel will also provide irrigation of up to 300 ha. Almost all of the electromechanical equipment has been obtained from Norway. The project will be connected to the national grid by a 33 kV, 20 km long transmission line including spans of up to 800 m to cross the deep gullys. The cost is $782/kW, lower than any other hydro plant in Nepal. 1 fig., 2 tabs.

1301 Resources and Availability

35872 (AD-A–204796/7/XAB) **National Hydroelectric Power Resources Study. Volume 12.** Army Inst. for Water Resources, Fort Belvoir, VA (USA). Sep 1981. 829p. (IWR–82-H-12). Available from NTIS, PC A99/MF E04.

This report contains a National Summary of selected, site-specific, data contained in the NHS regional reports and includes hydropower projects which have no apparent potential for economic hydropower additions. Selected site by site data are arranged by state, county, and project name in Appendix C. The text discusses inventory stages, analytic procedures, and study sequence.

35873 (EC/IWD–1988) **Quebec surface water data, 1987.** Environment Canada, Ottawa, ON (Canada). Inland Waters Directorate. 1988. V (MICROLOG–89-00807). Available from Water Survey of Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, Canada K1A 0E7; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Data are presented for water levels of rivers and lakes in Quebec for 1987. The data were collected by hydrometric surveys conducted by the Water Survey of Canada and assisted by other federal, provincial and private bodies such as Hydro-Quebec and the provincial environment ministry. Information presented in this report also includes summaries of monthly and annual data, daily discharge, and descriptive information relating to the gauging station, such as type of gauge, location, drainage area, and whether the flow is natural or regulated. 57 tabs.

35874 (OME–1988, pp. 19) **Small hydro in Canada, 1988.** Fawkes, P. (Patrick Fawkes and Associates, Vancouver, BC, Canada). Ontario Ministry of Energy, Toronto, ON (Canada). 1988. (CONF-880711–: Small hydro '88: international conference and trade show, Toronto, Canada, 4-9 Jul 1988;MICROLOG–89-02657;CE–02581). In *Small hydro '88. An international conference and trade show. Proceedings, vol. 2.* Available from Ontario Ministry of Energy, Communications Services Group, 62 Wellesley St., West, Main Floor, Toronto, ON, Canada M7A 2B7; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This paper presents an overview of present activity in small hydro (less than 15 MW) in Canada, and comments on the prospects for future small hydro development. There are presently more than 327 small hydro plants with a total peak capacity of 1000 MW; 6 more plants with a total capacity of 56 MW are under construction or committed for construction by the end of 1989. The paper lists presently operating plants and 20 selected projects which are presented in more detail. The potential for small hydro sites less than 10 MW has been estimated at 2000 MW at more than 1000 sites. Government supported demonstration projects (presently 21 in number) and research and development (11 contracts in 1986, 13 more in 1987) are discussed. Other factors affecting the development of small hydro power are the dissemination of information and private power producers associations. Two surveys of the Canadian small hydro industry have been achieved recently. In both cases, the US market was found to be the most important. This overview of the small hydro scene in Canada indicates that a modest industry exists which is capable of meeting present and expected levels of activity, it will grow when more provincial power utilities offer private power producers purchase rates which allow these producers to profit.

1303 Plant Design and Operation

35875 (EPRI-GS–6419-Vol.3) **Hydropower plant modernization guide: Volume 3, Automation: Final report.** Froehlich, D. Electric Power Research Inst., Palo Alto, CA (USA); Black and Veatch/Motor Columbus, Associates, Kansas City, MO (USA). c Jun 1989. 135p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The Automation Guide provides a procedure and associated information to enable utility personnel to identify which hydroelectric plants on their system are potentially suitable for the cost-effective implementation of automation. The guide provides screening criteria to make an initial assessment of plant suitability. A Feasibility section describes all the functional systems of a typical plant that should be considered for conversion to automatic operation. The instrumentation and other equipment that would be required by each of these systems are discussed and ranges of cost estimates are given. The guide addresses automation requirements suitable for either semi or fully-automatic, remotely controlled, unmanned sites, but sufficient information and detail are provided to allow the guide user to modify those approaches for specific plants. A brief but comprehensive section on economic evaluation methods is included. Worked examples of conversions of typical systems to automation demonstrate the use of the techniques and data. 30 figs., 18 tabs.

1306 Environmental Aspects

35876 (DOE/BP/24238–2 I.1.1-I.1.21) **Systems analysis and the fish and wildlife program.** USDOE Bonneville Power Administration, Portland, OR (USA). Div. of Fish and Wildlife; Resources for the Future, Inc., Washington, DC (USA). Dec 1988. In *Design of studies for development of Bonneville Power Administration fish and wildlife mitigation accounting policy. Phase 2, Final report: Volume 2, Technical reports.* Order Number DE89007411/JAW. Available from NTIS, PC A24/MF A01.

In simple terms, systems analysis can be defined as a body of theory and analytical techniques which are designed to assist policy makers in choosing among options. Two of the more useful tools of systems analysis are modeling, in which complex systems are represented by abstractions, and simulation, a process in which one tries to better understand system behavior and to anticipate potential future impacts of management actions by constructing and experimenting with various computer models. When used correctly, systems analysis can be a vital component of the decision-support systems used in natural resource management. The role of systems analysis within the framework of the Fish and Wildlife Program is the focus of this chapter, which begins with a discussion of the general use of modeling to support management and research. This report outlines an approach to modeling the salmon and steelhead fisheries of the Columbia River Basin with special reference to the impact of the hydroelectric system.

35877 (DOE/BP/24238–2 I.2.1-I.2.10) **Overview of models.** USDOE Bonneville Power Administration, Portland, OR (USA). Div. of Fish and Wildlife; Resources for the Future, Inc., Washington, DC (USA). Dec 1988. In *Design of studies for development of Bonneville Power Administration fish and wildlife mitigation accounting policy. Phase 2, Final report: Volume 2, Technical reports.* Order Number DE89007411/JAW. Available from NTIS, PC A24/MF A01.

The purpose of this chapter is to present an overview of the types of models needed to support management of the fisheries of the Columbia River Basin and the application of these models. Most of the preliminary ecological modeling work that has been completed at RFF during this phase of the research effort has focused on the life-stanza models. There are two reasons for this emphasis. First, it is within the life-stanza models that causal links between mitigation measures and biological responses must be specified at a relatively fine level of resolution. This requires a close inspection of the biological impacts of management actions on fish which goes beyond demonstrating that an empirical relationship exists between variables. Since the conditions under which such a relationship was produced may change, it is also important to understand how an empirical result might arise as a function of physical and biological processes. Only by understanding causal relationships can one hope to plan an efficient Fish and Wildlife Program. The second reason for focusing on the life-stanza models is a perceived need to examine particular components of the life cycle which have not received the attention they deserve. Opportunities for enhancing fish production in the Columbia Basin at a minimal cost or effort may be lost simply because they escape consideration.

35878 (DOE/BP/24238–2 I.3.1-I.3.8) **Juvenile production.** USDOE Bonneville Power Administration, Portland, OR (USA). Div. of Fish and Wildlife; Resources for the Future, Inc., Washington, DC (USA). Dec 1988. In *Design of studies for development of Bonneville Power Administration fish and wildlife mitigation accounting policy. Phase 2, Final report: Volume 2, Technical reports.* Order Number DE89007411/JAW. Available from NTIS, PC A24/MF A01.

A central feature of the Fish and Wildlife Program is the effort to bolster production of juvenile salmon and steelhead in the Columbia River Basin, as measured by both the quantity and quality of smolts. The present natural production of the Columbia system is a small fraction of the estimated production in predevelopment times. Part of this loss can be attributed directly to hydrosystem development which inundated spawning and rearing habitat, increased downstream passage mortality, and blocked passage of adult fish returning to spawn. Other factors such as agriculture, timber harvest, and urban development have also contributed to production losses through environmental degradation. Historically, the dominant means of mitigating production losses has been the use of hatcheries. Present efforts to increase production levels include a combination of both natural and artificial production methods, including using hatcheries to produce fry which are then released in natural streams for rearing. Additional measures which have been implemented or are proposed for the Columbia River Basin include the construction of additional artificial production facilities, water management schemes to provide suitable instream flows for naturally spawning fish, and studies to aid in the detection, diagnosis, and control of fish diseases and parasites.

35879 (DOE/BP/24238–2 I.4.1-I.4.24) **Modeling downstream migration.** USDOE Bonneville Power Administration, Portland, OR (USA). Div. of Fish and Wildlife; Resources for the Future, Inc., Washington, DC (USA). Dec 1988. In *Design of studies for development of Bonneville Power Administration fish and wildlife mitigation accounting policy. Phase 2, Final report: Volume 2, Technical reports.* Order Number DE89007411/JAW. Available from NTIS, PC A24/MF A01.

Each year millions of young salmon and steelhead trout released from hatcheries or reared naturally in tributary streams throughout the Columbia River Basin begin a perilous journey to the Pacific Ocean. Hydroelectric development of the Columbia System has replaced the once free-flowing rivers encountered by these fish with a series of slow-moving reservoirs punctuated by run-of-river dams. The considerable impact of development and operation of these dams and upstream storage reservoirs on outmigrating juveniles is well documented and has prompted an extensive program of mitigation measures. An end result of hydrosystem development and operation is that smolts migrating from their headwater streams of origin are now faced with a passage that takes longer, is more physically taxing, and includes new sources of mortality, as compared to pre-development times. Models are needed which can help assess hydrosystem impacts and evaluate the relative effectiveness of potential management actions such as improvements in passage facilities, transportation, and providing increased flow for fish measures which are designed to improve survival through the system. The modeling approach described in this chapter focuses on the processes involved in reservoir passage. By emphasizing the reservoir passage component, this modeling approach should complement rather than supplant existing models.

35880 (DOE/BP/24238–2 I.5.1-I.5.37) **Modeling the estuary and early ocean life stanza.** USDOE Bonneville Power Administration, Portland, OR (USA). Div. of Fish and Wildlife; Resources for the Future, Inc., Washington, DC (USA). Dec 1988. In *Design of studies for development of Bonneville Power Administration fish and wildlife mitigation accounting policy. Phase 2, Final report: Volume 2, Technical reports.* Order Number DE89007411/JAW. Available from NTIS, PC A24/MF A01.

Each year, millions of juvenile anadromous salmon and trout pass through the Columbia River estuary on a journey to the Pacific Ocean where they grow to adulthood. For many of these salmonids, the relative success of the stock may be largely determined by the magnitude of the mortality incurred during their brief stay in the estuary or in the first few months following entry into seawater. Understanding of the mechanisms affecting survival and growth of juvenile salmonids in the estuary and near-shore oceanic environment is crucial to the effective management of these species. Fishery managers and those interested in salmonid enhancement in the Columbia River Basin face the challenge of identifying management actions that will enhance the prospects of marine survival of each stock. Despite a growing body of research on the Columbia and other Northwest estuaries, major uncertainties pervade our knowledge of critical ecological processes which affect salmonids during their estuary and early ocean (EEO) tenure. Where major uncertainties exist, a valid use of simulation models is to explore alternative hypotheses concerning causal mechanisms with the intention of identifying crucial da8ta needs. In order to demonstrate the utility of developing models of the EEO component for Columbia Basin Stocks, an example model has been construction which simulates the mortality and growth of a hypothetical chinook stock which enters the estuary as subyearlings. Mean length and mean time of arrival at the estuary can be adjusted to simulate the potential impacts of upstream management actions which affect these variables. Given the level of uncertainty surrounding our present

knowledge of marine ecological processes, the intent of the model presented here is to focus debate and refine understanding.

35881 (DOE/BP/24238–2 I.6.1-I.6.14) **Modeling the late ocean life stanza.** USDOE Bonneville Power Administration, Portland, OR (USA). Div. of Fish and Wildlife; Resources for the Future, Inc., Washington, DC (USA). Dec 1988. In *Design of studies for development of Bonneville Power Administration fish and wildlife mitigation accounting policy. Phase 2, Final report: Volume 2, Technical reports.* Order Number DE89007411/JAW. Available from NTIS, PC A24/MF A01.

Most of the research on the late ocean component of the salmon life cycle historically has focused on sport and commercial ocean harvest. But allocation of harvest is not the only issue of importance in the ocean fisheries. Ecological issues such as growth rates, size structure, and age at sexual maturity interact with harvest rates to influence the relative productivity and fitness of a stock. These interactions can be conveniently explored with simulation models. As an example, this chapter describes a model which allows one to address interesting ecological questions in addition to harvest. The example model presented here allows one to experiment with various combinations of growth rates, harvest rates, and mechanisms for determining the fraction of the population which matures each year (return schedules). Options are provided such that one can specify return schedules as a function of both age and size. Other models which have been applied to Columbia stocks do not permit this flexibility. Output from the model includes age and length distribution of returning adults. This output can be combined with external information including length-fecundity relationships to produce estimates of reproductive potential.

35882 (DOE/BP/24238–2 I.7.1-.7.25) **Modeling the upstream migration of adult salmonids.** USDOE Bonneville Power Administration, Portland, OR (USA). Div. of Fish and Wildlife; Resources for the Future, Inc., Washington, DC (USA). Dec 1988. In *Design of studies for development of Bonneville Power Administration fish and wildlife mitigation accounting policy. Phase 2, Final report: Volume 2, Technical reports.* Order Number DE89007411/JAW. Available from NTIS, PC A24/MF A01.

Hydroelectric development of the Columbia River Basin poses major obstacles for adult Pacific salmon and anadromous trout trying to return to their natal spawning areas. The dams which clog the mainstem Columbia River and its major tributary, the Snake River, effectively block or impair the upstream migration of fish. Dams which are not equipped with fish passage facilities, such as Chief Joseph and Hells Canyon, prevent anadromous fish from using large areas where natural spawning occurred historically. Downstream, run-of-river dams equipped with fish ladders have less obvious, but equally real, impacts. Poor design or inefficient operation of installed passage facilities can result in delay or mortality of migrating fish, thus reducing the numbers or fitness of adults reaching upstream spawning areas. In order to assess the chances of an individual making a successful spawning migration, one must estimate the likelihood of available energy reserves being sufficient to cover the energetic demands of the migration. Thus arises the three necessary parts of an upstream migration model: (1) an estimate of the variability in the migration paths (both time and distance) experienced by a stock; (2) an estimate of the caloric demand associated with each migration path; and (3) integration of (1) and (2) to provide an estimate of the energy reserves available for spawning within a stock and the distribution of those reserves among individuals.

35883 (DOE/BP/24238–2 I.8.1-I.8.37) **Smolt monitoring in the Columbia River Basin.** USDOE Bonneville Power Administration, Portland, OR (USA). Div. of Fish and Wildlife; Resources for the Future, Inc., Washington, DC (USA). Dec 1988. In *Design of studies for development of Bonneville Power Administration fish and wildlife mitigation accounting policy. Phase 2, Final report: Volume 2, Technical reports.* Order Number DE89007411/JAW. Available from NTIS, PC A24/MF A01.

The monitoring or counting of Columbia River Basin juvenile salmon and steelhead trout as they migrate to the sea from hatcheries and natural nursery areas has two principal objectives: (1) to keep track of the outmigration on a real-time basis in order to provide information to those responsible for manipulating streamflows and spills at dams, with the goal of increasing downstream passage survival; and (2) to permit assessment of the biological and cost-effectiveness of the several mitigation policies under consideration. Monitoring of the outmigration and evaluation of mitigation strategies will continue to be a major concern of fishery managers and researchers in the Columbia River Basin for some time. In this chapter, we have discussed some of the problems encountered in smolt monitoring and introduced some of the potential technological and statistical advances which may alleviate some of these problems. We believe that some of these problems can be resolved. However, their resolution will require a sound research design, a commitment on the part of fisheries managers and funding agencies, innovation and discipline of the part of researchers, and cooperation all around.

35884 (DOE/BP/24238–2 II.1.1-II.1.29) **Economic analyses of fish mitigation strategies.** USDOE Bonneville Power Administration, Portland, OR (USA). Div. of Fish and Wildlife; Resources for the Future, Inc., Washington, DC (USA). Dec 1988. In *Design of studies for development of Bonneville Power Administration fish and wildlife mitigation accounting policy. Phase 2, Final report: Volume 2, Technical reports.* Order Number DE89007411/JAW. Available from NTIS, PC A24/MF A01.

An attempt is made to report on methods for analyzing the cost and long-term fish production implications of alternative management strategies for improving the anadromous fisheries in the Columbia River Basin and for identifying cost-effective alternative means for achieving biological objectives ultimately to be specified by the Northwest Power Planning Council. Different types of cost-effectiveness analyses are presented and their applicability to the analysis of fish mitigation are assessed in the context of the Columbia River salmon and steelhead fisheries. The conditions are described that were assumed for the design and development of methods of cost-effectiveness analysis presented in this part. These conditions include the biological objectives for the fisheries to be established by the Council, the economic criterion used to compare mitigation alternatives, the types of costs included in the cost-effectiveness analyses, and the nature of the policy constraints imposed on the analyses. Three problem types likely to be encountered in assessing the cost-effectiveness of alternative mitigation strategies are described. The two cost-effectiveness models proposed for development are presented.

35885 (DOE/BP/24238–2 II.2.1-II.2.20) **Assessing the cost-effectiveness of alternative mitigation strategies: the simulation model.** USDOE Bonneville Power Administration, Portland, OR (USA). Div. of Fish and Wildlife; Resources for the Future, Inc., Washington, DC (USA). Dec 1988. In *Design of studies for development of Bonneville Power Administration fish and wildlife mitigation accounting policy. Phase 2, Final report: Volume 2, Technical reports.* Order Number DE89007411/JAW. Available from NTIS, PC A24/MF A01.

This chapter describes the principal elements and features of an economic-ecologic simulation model designed to assess the costs and the long-term fish production implications of alternative management strategies for enhancing the salmon and steelhead fisheries in the Columbia River Basin. The design of the model is based on the availability of an energy planning model for the Pacific Northwest, an hydrosystem simulation model of the Columbia River Basin, and an hydrosystem regulator that already exist in the region, and on a simulation model of the salmon and steel head fisheries to be developed in another part of this project. It is important to note that such a model has not actually been developed for the Columbia Basin but that what is discussed here is an outline of how such a model could be developed.

35886 (DOE/BP/24238–2 II.3.1-II.3.72) **Identifying the most cost-effective fish mitigation strategy: the least-cost model.** USDOE Bonneville Power Administration, Portland, OR (USA). Div. of Fish and Wildlife; Resources for the Future, Inc., Washington, DC (USA). Dec 1988. In *Design of studies for development of Bonneville Power Administration fish and wildlife mitigation accounting policy. Phase 2, Final report: Volume 2, Technical reports.* Order Number DE89007411/JAW. Available from NTIS, PC A24/MF A01.

The goal of this chapter is to identify the structure of a least-cost mathematical programming model and to estimate its size. Structure

and size are the two principal attributes of such models that influence their success in real applications. For large scale applications such as this, the most desirable model structure from a computational perspective is a linear programming (LP) model. In order to be able to use linear programming, through, all the cost functions and all the constraining relationships must either be linear or be approximated by linear segments. The purpose of this model is to assist in identifying system-wide least cost fish mitigation alternatives. Such a model is needed because it is unlikely that the least-cost alternatives or set of alternatives can be identified using the hydrosystem and fish simulation models. Nonetheless, this will not be achieved without considerable effort and without overcoming computational problems unique to the various optimization algorithms. These computational problems are due partly to model structure and partly to model size. The priority for model structure, based both on experience and on ease of application, has been ordinary linear programming (LP), mixed integer linear programming, and nonlinear programming, in that order. The mathematical development in this chapter has demonstrated that it will not be possible to construct a least-cost model for fish mitigation in the Columbia River Basin using ordinary linear programming (LP). However, at least in principle, it will be possible for construct a least-cost model using mixed integer linear programming.

35887 (DOE/BP/24238–2 II.4.1-II.4.15) **Feasibility of implementing the least-cost model.** USDOE Bonneville Power Administration, Portland, OR (USA). Div. of Fish and Wildlife; Resources for the Future, Inc., Washington, DC (USA). Dec 1988. In *Design of studies for development of Bonneville Power Administration fish and wildlife mitigation accounting policy. Phase 2, Final report: Volume 2, Technical reports.* Order Number DE89007411/JAW. Available from NTIS, PC A24/MF A01.

It has been demonstrated that the least-cost fish mitigation model will fit mathematically and conceptually into a mixed-integer linear programming framework. The conceptual model developed in there is extremely large, for two reasons. First, the number of stocks, reservoirs, dams, and mitigation alternatives is enormous, since the Columbia basin is a very large and diverse region. Second, it is likely to take several salmonid generations for the stocks in the region to double in size. The size of the proposed least-cost model poses two problems with respect to actually constructing and solving the large system of equations. The first concerns the data requirements for the model. The amount of information needed to construct the model is very large, and it seems likely that there will be difficulties with both finding the requisite primary data and generating the coefficients required to solve the least-cost model in any type of mathematical programming framework. Even if the data needed were readily available in an easily usable form, and there were no uncertainty associated with the phenomena being modelled, however, other problems would remain. This category can be described as analytical problems. It includes the mathematical and computational feasibility of solving any large model where iterative solution methods are required to find a solution which minimized (or maximizes) an objective function and simultaneously meet an exogenous set of constraints. The remainder of this chapter attempts to show the major causes of the problems, and suggests some possible ways to address the analytical issues involved. It ends by concluding that the analytical problems caused by the large size of the least-cost model may be solvable, using matrix decomposition techniques.

35888 (DOE/BP/24238–2 II.5.1-II.5.39) **Assessing the opportunity cost of fish mitigation activities in the Columbia River Basin.** USDOE Bonneville Power Administration, Portland, OR (USA). Div. of Fish and Wildlife; Resources for the Future, Inc., Washington, DC (USA). Dec 1988. In *Design of studies for development of Bonneville Power Administration fish and wildlife mitigation accounting policy. Phase 2, Final report: Volume 2, Technical reports.* Order Number DE89007411/JAW. Available from NTIS, PC A24/MF A01.

This chapter examines a variety of methods for assessing the opportunity costs of fish mitigation activities. It is specifically concerned with the opportunity costs associated with irrigation and hydropower. In the case of irrigation, we assume that a water rights market exists in the region, such that farmers could buy and sell rights to irrigation water. Although such rights markets are in use elsewhere in the Western states, no markets for irrigation water are presently in operation in the Pacific Northwest. While we do not advocate the establishment of such markets, previous work in the area suggests that both farmers and electricity consumers might both be made better off if in fact such markets were to function. The fact that irrigation withdrawals have been established to be important factors limiting fish production in some subbasins in the region, including the Yakima and Umatilla, suggests that reduction of irrigation withdrawals might well be a cost-effective means for enhancing fish runs. The work in this chapter should be viewed as steps toward developing a means for establishing the difference in costs between enhancing fish runs with and without an active water rights market, in which rights might be acquired for enhancing fish runs. It should not be taken as advocacy of establishing such markets.

35889 (DOE/BP/24238–2 II.6.1-II.6.10) **Data needs for proposed pilot study.** USDOE Bonneville Power Administration, Portland, OR (USA). Div. of Fish and Wildlife; Resources for the Future, Inc., Washington, DC (USA). Dec 1988. In *Design of studies for development of Bonneville Power Administration fish and wildlife mitigation accounting policy. Phase 2, Final report: Volume 2, Technical reports.* Order Number DE89007411/JAW. Available from NTIS, PC A24/MF A01.

Data are presented that would be needed for a pilot study of a subbasin. These data will be used to develop an economic-ecologic simulation model designed to assess the costs and the long-term fish production implications of alternative management strategies for enhancing the salmon and steelhead fisheries in the Columbia River Basin. In addition, the data will be used to develop a least-cost model to assist in identifying system-wide least cost fish mitigation alternatives. Data needs for the develop of the economic-ecologic simulation and least-cost models are organized into four groups. They are: hydrosystem data; fish life-cycle data; direct costs of fish mitigation alternatives; and opportunity costs of fish mitigation alternatives.

35890 (DOE/BP/24238–2 III.1.1-III.1.8) **History of the Columbia River salmon fisheries.** USDOE Bonneville Power Administration, Portland, OR (USA). Div. of Fish and Wildlife; Resources for the Future, Inc., Washington, DC (USA). Dec 1988. In *Design of studies for development of Bonneville Power Administration fish and wildlife mitigation accounting policy. Phase 2, Final report: Volume 2, Technical reports.* Order Number DE89007411/JAW. Available from NTIS, PC A24/MF A01.

In order to understand the current fisheries based on Columbia River salmon stocks, it is important to have a general historical perspective of how the fisheries evolved over time. We likely tend to think of the commercial and recreational exploitation of Columbia River stocks as a relatively recent - i.e., 19th and 20th century - development. However, native Americans fished for both commercial and sport purposes and utilized the salmon stocks of the Columbia River hundreds of years ago.

35891 (DOE/BP/24238–2 III.2.1-III.2.29) **Mathematical programming models of the ocean salmon fishery.** USDOE Bonneville Power Administration, Portland, OR (USA). Div. of Fish and Wildlife; Resources for the Future, Inc., Washington, DC (USA). Dec 1988. In *Design of studies for development of Bonneville Power Administration fish and wildlife mitigation accounting policy. Phase 2, Final report: Volume 2, Technical reports.* Order Number DE89007411/JAW. Available from NTIS, PC A24/MF A01.

Mathematical programming offers a potentially attractive way to model the bio-economics of the ocean fishery for salmon. It also provides a means to explore the effect of different management alternatives on these relationships. Formally, the mathematical programming model is a constrained-optimization problem that is stated in terms of single-valued continuous differentiable functions. This type of model offers limited opportunities to consider stochastic elements of the fishery problem. However, it has the potential capability of handling large variable set and possesses other attributes which enhance its desirability as a way to quantitatively represent the ocean salmon fishery. In the following, we will discuss how mathematical programming might be applied to the salmon ocean fishery problem. We shall also assess the pros and cons of some alternative formulations for this class of models, and propose a particular

formulation which we believe strikes a reasonable balance between ease of computation, flexibility of use and richness of results. The assumptions necessary to develop this type of model are specified, and its desirability as a way to model the fishery is evaluated.

35892 (DOE/BP/24238–2 III.3.1-III.3.39) **Procedures for valuing changes in ocean salmon stocks.** USDOE Bonneville Power Administration, Portland, OR (USA). Div. of Fish and Wildlife; Resources for the Future, Inc., Washington, DC (USA). Dec 1988. In *Design of studies for development of Bonneville Power Administration fish and wildlife mitigation accounting policy. Phase 2, Final report: Volume 2, Technical reports.* Order Number DE89007411/JAW. Available from NTIS, PC A24/MF A01.

This chapter describes various approaches for measuring the economic value of harvesting enhanced Columbia River salmon stocks. Such values are necessary to mathematical programming model as well as being of interest in their own right.

35893 (DOE/BP/24238–2 III.4.1-III.4.9) **Determination of economic impacts.** USDOE Bonneville Power Administration, Portland, OR (USA). Div. of Fish and Wildlife; Resources for the Future, Inc., Washington, DC (USA). Dec 1988. In *Design of studies for development of Bonneville Power Administration fish and wildlife mitigation accounting policy. Phase 2, Final report: Volume 2, Technical reports.* Order Number DE89007411/JAW. Available from NTIS, PC A24/MF A01.

The benefits associated with decisions related to Columbia River fishery stocks have been discussed at a highly aggregated level. Analytical approaches to estimating these aggregate benefits have attempted to assess the sum total of the direct economic benefits that various decisions and actions imply, regardless of how the benefits and costs are distributed. However, such approaches may paint only partial pictures of the economic impacts of a decision. Numerous secondary benefits may be realized by activities which either provide inputs to or use the outputs of the commercial or recreational fishing sectors. For example, a large increase in the number of recreational fishermen that visit a harbor town may increase the sales of the restaurants in that town. Furthermore, an aggregate approach usually fails to investigate the income and employment impacts that states, local communities, or specific groups of individuals may experience. Decisions which may appear to yield positive economic benefits on an aggregated national level, for example, could affect specific local communities or groups negatively, and vice-verse.

35894 (GAO/RCED–88-60) **Energy regulation.** General Accounting Office, Washington, DC (USA). Resources, Community and Economic Development Div. 1988. 42p. Available from US General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

The Federal Energy Regulatory Commission conducts physical inspections of projects in accordance with its established procedures and monitors correction of any identified problems. Because of ineffective controls, however, FERC's monitoring of compliance with items required by the licenses and exemptions, such as emergency action plans and dam safety reports, does not always result in timely and consistent follow-up of overdue items. Furthermore, because of inaccurate data, FERC's computerized tracking system is of limited use as a tool.

35895 (MEW/WS–88-5) **Water chemistry/water discharge relationships within the Churchill River diversion and Lake Winnipeg regulation region, Manitoba, Canada.** Duncan, D.A.; Williamson, D.A. Manitoba Dept. of Environment and Workplace Safety and Health, Winnipeg, MB (Canada). Water Standards and Studies Section. 1988. 65p. (MICROLOG–89-00886). Available from Manitoba Legislative Library, 200 Vaughan St., Winnipeg, MB, Canada R3C 1T5; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Hydroelectric power development in northern Manitoba has led to the diversion of the Churchill River and the regulation of Lake Winnipeg water levels. As part of an ecological monitoring program, statistically significant linear relationships were found between a number of water chemistry parameters and discharge at various sites within the diversion and regulation region. Linear relationships that were similar and present both before and after development are most useful for providing corroborative evidence that water chemistry changes are coincident with development. These relationships are also beneficial in assisting focus of future field activities related to water chemistry impacts. Such relationships were observed for the parameters conductivity, alkalinity, Ca and Cl- in the Burntwood River at Thompson, total P in the Churchill River upstream of Granville Lake, and conductivity and Ca in Littie Playgreen Lake near Norway House. Numercus relationships between water chemistry parameters and discharge have been significantly altered likely as a consequence of development. These relationships provide direct evidence that changes occurred within the system, but can only be used for indirect corroboration of previously identified water chemistry changes associated with development. Relationships that were statistically significant after development might be used cautiously to predict potential changes in water chemistry coincident with future alterations in discharge. Such relationships occurred for a number of parameters at most sites. Other parameters were not linearly related with discharge during either the pre-development or post-development period. 9 refs., 27 figs., 10 tabs.

35896 (MEW/WS–1987) **Canada-Manitoba agreement on the study and monitoring of mercury pollution in the diversion system of the Churchill River. Summary report.** Manitoba Dept. of Environment and Workplace Safety and Health, Winnipeg, MB (Canada). Water Standards and Studies Section. 1987. 95p. (In French). (MICROLOG–89-00509). Available from Environment Canada, Library Services, Terrasses de la Chaudiere, 10 Wellington St., Ottawa, ON, Canada K1A 0H3; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The Lake Winnipeg, Churchill-Nelson River Hydroelectric Project in northern Manitoba includes river diversions that resulted in extensive areas of flooded terrain. Elevated mercury levels in fish from lakes along the diversion were noted, and concern for the possible health and economic impacts has led to a federal-provincial agreement to study the problem. There was no indication of elevated levels of natural Hg, and no evidence of important man-made sources. Methyl mercury, the predominant form of mercury in fish, is produced naturally in aquatic environments in small amounts by bacterial methylation. Studies done under the agreement found that net methylation rates were highest in the flooded areas, and that there was a high correlation between methylation rates and mercury levels in fish. It was also known that the most important factor affecting those rates is the amount and type of flooded organic material. At least in the case of moss-peat material, a doubling of the amount of this material resulted in a doubling of mercury accumulated in fish. It was also found that a wide variety of organic materials could stimulate the bioaccumulation of mercury in fish, indicating that the effect of flooding on mercury levels in fish is a general response. Another important factor is the amount of oxygen present; very low oxygen levels mean higher net methyl mercury production. The overall results of the agreement and other recent studies indicate that elevated mercury levels in fish following impoundment is a widespread problem that must be taken into account when planning future impoundment or reservoir projects. Includes glossary. 3 refs., 40 figs., 14 tabs.

35897 (TVA/WR/AB–89/6) **Results of fisheries investigations in Douglas tailwater, August 1987–September 1988.** Tomljanovich, D.A.; Saylor, C.F. Tennessee Valley Authority, Norris, TN (USA). Aquatic Biology Dept. May 1989. 45p. Order Number DE89014510/JAW. Available from NTIS, PC A03/MF A01 - OSTI.

Releases from Douglas Dam during July, August, and early September are characterized by low dissolved oxygen (DO), increased hydrogen sulfide, and until fall 1987, no minimum flow. Studies are underway to improve water quality in the tailwater. A five-year minimum flow demonstration began October 1, 1987. To achieve a 300 cfs minimum flow at Saffell Island, 2.5 river miles downstream from Douglas Dam, one turbine in the 3200 to 4000 cfs range is pulsed for 35 to 45 minutes every four hours. In addition to minimum flow, surface water pumps and oxygen diffusers in front of the hydro unit intakes are being evaluated as ways to increase DO in the tailwater. During this five-year demonstration water quality monitoring and biological investigations will document changes and responses to increased minimum flow and improved water quality.

Objectives of the biological investigations are to document: (1) changes, characteristics, and diversity of the fish community of the tailwater using the Index of Biotic Integrity (IBI), (2) spawning locations and movement patterns of sauger in the tailwater, (3) reproduction of sauger and other species in the tailwater, and (4) fisherman distribution and creel throughout the tailwater. 10 refs., 3 figs., 16 tabs.

35898 (TVA/WR/WQ–89/1) **Pilot program for water quality data collection by volunteers.** Technical report series. Butkus, S.R. Tennessee Valley Authority, Chattanooga, TN (USA). Water Quality Dept. Mar 1989. 47p. Sponsored by Tennessee Valley Authority. Order Number DE89014508/JAW. Available from NTIS, PC A04/MF A01 - OSTI.

Like other water resource agencies elsewhere in the nation, TVA is now receiving increasing demands to provide more information about water quality in many areas of the Tennessee Valley, usually with little or no provision for increased staff or budget. In response to this challenge, TVA in 1988 began a pilot program to assess the value of using citizen volunteers to monitor selected water quality characteristics on Chickamauga Reservoir and to determine the feasibility of establishing a network of such volunteers throughout the Tennessee Valley to collect water quality at locations that are not now being sampled frequently or regularly. TVA provided the necessary equipment and trained volunteers to use it properly. The volunteers donated their time to make observations and measurements that expanded the available database.

35899 (TVA/WR/WQ–89/2) **Measurement of upwelling flow from Upper Bear Creek reservoir air diffusers.** Brown, R.T.; Gordon, J.A. Tennessee Valley Authority, Knoxville, TN (USA). Water Quality Dept. May 1988. 42p. Sponsored by Tennessee Valley Authority. Order Number DE89014507/JAW. Available from NTIS, PC A03/MF A01 - OSTI.

Field tests were performed to determine the upwelling flow from the air diffusers located in Upper Bear Creek reservoir. The diffusers were installed in an effort to maintain aerobic conditions throughout the water column, so that the reservoir and hence low level summer releases would not contain high concentrations of dissolved iron, manganese, and sulfide. Three tests were conducted using one diffuser, at the normal air flow rate of 0.012 m^3/sec (25 scfm), at an increased air flow rate of 0.024 m^3/sec (50 scfm) and at reduced air flow rate of 0.006 m^3/sec (12.5 scfm). The upwelling from the air diffuser was dyed with Rhodamine WT and concentrations in the flow away current were measured to estimate the total upwelling flow. Velocity measurements obtained in the flow away current provided a second estimate of the upwelling flow. These field estimates at the Upper Bear Creek diffuser were compared with equations found in the literature. The measured Upper Bear Creek diffuser upwelling flow was greater than these equations predicted, although the general magnitude was confirmed. 18 refs., 5 figs., 3 tabs.

35900 (CFS/NF–8710) **Proceedings of the workshop on aspen pulp, paper and chemicals.** Wong, A. (ed.); Szabo, T. (ed.). Canadian Forestry Service, Edmonton, AB (Canada). Northern Forest Research Centre. 1987. 260p. (CONF-8710145–: Biochemical conversion program annual review meeting, Golden, Colorado, USA, 13-15 Oct 1987;MICROLOG–89-01396). Available from Northern Forestry Centre, 5320 - 122 Street, Edmonton, AB, Canada T6H 3S5; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

A workshop was held in Alberta to communicate research results related to improved utilization and development of provincial forest resources, notably aspens. This species comprises about 40% of Alberta's total wood volume, and only about 10% of this resource is utilized. Papers were presented on various means of utilizing aspens (and other trees such as birches), mostly for pulp production in the paper industry. Also considered were production of alcohol fuels and chemical byproducts. Separate abstracts have been prepared for two papers from this workshop.

35901 (DOE/CE/15270–T10) **Explorations of mechanisms regulating ectomycorrhizal colonization of boron-fertilized pine: Quarterly report, April 1,1989–June 30, 1989.** Garrett, H.E.; Begonia, G.; Sword, M.A. Missouri Univ., Columbia, MO (USA). School of Forestry, Fisheries and Wildlife. 1989. 13p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract FG01-86CE15270. Order Number DE89014452/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The present study examines the effects of foliar boron fertilization and inoculation with an ectomycorrhizal fungus (Pisolithus tinctorius) on ^{14}C-photosynthate partitioning to various tissues of shortleaf pine seedlings, placing special emphasis on the ^{14}C distribution to the root systems. Specifically, the hypotheses to be tested are: (a) ^{14}C allocation to the root systems will increase with inoculation, and (b) ^{14}C partitioning will be enhanced by foliar boron application.

35902 (DOE/OR/21390–T25) **Biomass energy facilities: 1988 Directory of the Great Lakes region.** Council of Great Lakes Governors, Chicago, IL (USA). Great Lakes Regional Biomass Energy Program. 1988. 941p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract FG05-83OR21390. Order Number DE89014798/JAW. Available from NTIS, PC A99/MF A01 - OSTI; GPO Dep.

In order to introduce and encourage private sector use of the vast renewable resource in the Great Lakes region, the Great Lakes Regional Biomass Energy Program has produced this directory of biomass energy systems. The directory, which was compiled with the assistance of the state biomass energy agencies in the region, documents the many firms and institutions utilizing biofuels. It is hoped that the detailed information on each facility will be useful to persons and organizations considering investments in bioenergy systems. The directory is divided into five sections covering the most common biofuel systems found in the region: (1) alcohol production, (2) crop residue combustion, (3) methane production, (4) waste-to-energy, and (5) wood combustion. In each section the facilities are grouped by state. The state subsections are presented alphabetically, and within each state the facilities are listed in alphabetical order by organizational name. Independent School Districts (ISD) in Minnesota are arranged alphabetically by the name of the town in which they are located. Preceding each state subsection, there is a map showing the distribution within the state of that type of biomass facility. 12 refs.

35903 (ETDE-mf–9788279) **Microbiological investigations on nitrification in waste water treatment plants with fixed sludge beds. Pt. 2. Pilot scale test. Final report.** Dengler, D.; Eberhardt, H. Institut fuer Umweltanalytik und Biotechnologie G.m.b.H., Pforzheim (Germany, F.R.); Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.). Dec 1988. 48p. (In German). Order Number DE89788279/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The effluent of the settling tank of a waste water treatment plant was enriched with additional ammonium for the purpose of further nitrification. At the initial stage nitrifying enrichment cultures from the laboratory were added. The long generation times and the small growth rates of nitrificants proved to be obstructive for a pilot scale application. Installations of fixed sludge beds (BIO-NET) in the reactor led to enrichment cultures with ammonium containing waste water without additional inoculation. The content of nitrificants and the population of nitrificants in the reactor, at the wall and upon the fixed beds was determined by means of fluorescence microscopy and by flow cytometry. The part of the genus Nitrosomonas in the reactor was 10%, that is 2-3 times more than it is in the aeration tank of a waste water treatment plant. (orig.) With 11 refs., 4 tabs., 28 figs.

35904 (FCC–8801) **Steam pretreatment of wood in relation to enzymatic hydrolysis. Final report.** Forintek Canada Corp., Ottawa, ON (Canada). 1988. 183p. (MICROLOG–89-00766). Available from Forintek Canada (Ottawa), Montreal Rd., Ottawa, ON, Canada K1S 0W5; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The effects of variables in steam pretreatment of aspenwood (temperature, time, moisture content and SO_2 catalysis) have been determined, with and without explosion, on the resulting composition and enzymatic hydrolysis. Combination treatments (steaming + wet-milling, or steaming + H_2O_2 treatment) further increase accessibility. Results show that accessibility is not increased by explosion, but is increased by hydrolysis of both xylan and lignin, and by H_2O_2 oxidation of lignin. Accessibility correlates well with content of residual alkali-insoluble lignin (the most important factor), but not with total residual lignin, and not with xylan. Free alkali-soluble lignin has no effect. H_2O_2 increases accessibility by reducing the content of alkali-insoluble lignin, which presumably restricts cell-wall swelling. SO_2 catalysis increases hydrolysis relative to undesirable pyrolysis and xylose destruction. Variables (ratio of wood/gum volume, SO_2/wood, temperature, time and moisture content) have been studied, and further improorvements by H_2O_2 measured. Analytical methods for substrates and enzymatic hydrolysates are discussed, and the reason for discrepancies shown. Improved high pressure liquid chromatography methods for enzyme assay are reported. Crystallinity is not decreased by steam treatment, with or without explosion. 31 refs., 29 figs., 34 tabs.

35905 (ORNL/TM–11054) **Bioprocessing research for energy applications.** Scott, C.D.; Gaden, E.L. Jr.; Humphrey, A.E.; Carta, G.; Kirwan, D.J. Oak Ridge National Lab., TN (USA). Apr 1989. 207p. Sponsored by DOE Energy Research. DOE Contract AC05-84OR21400. (CONF-8811104–Summs.: Meeting on bioprocessing research for energy applications, Alexandria, VA, USA, 2-4 Nov 1988). Order Number DE89013735/JAW. Available from NTIS, PC A09/MF A01 - OSTI; GPO Dep.

The new biotechnology that is emerging could have a major impact on many of the industries important to our country, especially those associated with energy production and conservation. Advances in bioprocessing systems will provide important alternatives for the future utilization of various energy resources and for the control of environmental hazards that can result from energy generation. Although research in the fundamental biological sciences has helped set the scene for a "new biotechnology," the major impediment to rapid commercialization for energy applications is the lack of a firm understanding of the necessary engineering concepts. Engineering research is now the essential "bridge" that will allow the development of a wide range of energy-related bioprocessing systems. A workshop entitled "Bioprocessing Research for Energy Applications" was held to address this technological area, to define the engineering research needs, and to identify those opportunities which would encourage rapid implementation of advanced bioprocessing concepts.

35906 (PB–89-172225/XAB) **Marine biomass: New York State species and site studies. Annual report December 1982-November 1983.** McKay, L.B. New York Sea Grant Inst., Albany, NY (USA). Nov 1983. 229p. Available from NTIS, PC A11/MF A01.

See also PB–85-113462.

The Energy Authority has been conducting tests since 1979 in an effort to develop a feasible system for the production in Long Island Sound of marine biomass from indigenous macroalgae for economically competitive conversion to synthetic natural gas. During 1983 this goal was brought closer to realization when a 120 x 41 foot seaweed test farm was placed in 60 feet of water in Long Island Sound. The structure is basically a flexible wire cable and rope grid, buoyed at the surface and moored to the bottom of the Sound. It is suitable for cultivating seaweeds that attach themselves to surfaces such as the brown kelp, Laminaria saccharina. The test farm design was chosen from among four previously developed by the engineering team. An ongoing program is taking place in Long Island Sound to test the strength of the structure and to obtain information on plants growing in the structure. The program will test the strain on the lines, corrosion on metal parts, and available light and temperature at various times. Also, since 1982, bioengineering tests have focused on biofouling experiments, and seaweed and rope strength tests. The report also includes discussion of a laboratory research program focused on seeding techniques and strain selection.

35907 (PNFI–PI-X-85) **Theory and methodology of single tree volume estimation.** Titus, S.J.; Morgan, D.J. Institut Forestier National de Petawawa, Chalk River, ON (Canada). 1988. 33p. (In English and French). (MICROLOG–89-01030). Available from Petawawa National Forestry Institute, Library, Forestry Canada, Chalk River, ON, Canada K0J 1J0; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The purpose of this paper is to summarize current knowledge about major relationships used to predict individual tree bole volumes. The theory of tree volume relations is discussed, based on the modelling of the main stem (bole) as a cone. Evaluation of tree volume relations is then outlined, considering population specifications, sampling methods, measurement procedures, and curve fitting (regression analysis). Finally, the use of tree volume relations is described, including the use of existing volume relationships, extrapolation, and adjustment of existing volume relationships in new applications. 15 refs.

35908 (SERI/CP–213-3495) **Photovoltaics advanced research and development: 9th annual review meeting.** Solar Energy Research Inst., Golden, CO (USA). 1989. 122p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. (CONF-890533–Absts.: 9. SERI photovoltaic advanced research and development project review meeting, Lakewood, CO, USA, 24-26 May 1989). Order Number DE89000895/JAW. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

This paper contains a list of abstracts of papers presented at the conference. Topics covered include: thin film technology; fundamental research; and measurement and characterization techniques. (JEF)

35909 (SERI/SP–220-3366) **Biofuels technical information guide.** Solar Energy Research Inst., Golden, CO (USA). Apr 1989. 198p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. Order Number DE89000894/JAW. Available from NTIS, PC A10/MF A01 - OSTI; GPO Dep.

This guide combines an overview of the biofuels technologies with extensive references to useful information sources. Chapter 1 presents a brief history and overview of biomass applications in the United States and offers relevant information resources. Also included are descriptions of federal programs that address biofuels. Although the primary focus of the guide is on US applications and research, Chapter 1 also reviews activities around the world. Chapter 2 surveys the biomass resources in the United States. Chapter 3 describes technologies for producing a number of liquid and gaseous fuels. Several environmental and economic aspects of biofuels are discussed in Chapter 4. Chapters 2 through 4 focus primarily on the technologies being pursued by the US Department of Energy (DOE) through the Biofuels and Municipal Waste Technology (BMWT) Division. Although this approach does not address all potential applications of biomass and wastes, it covers the majority of current US research on liquid and gaseous fuels. Chapter 5 is a directory of US agencies, companies, and laboratories involved in biofuels research. Each entry includes a description of the organization's activities, the address, and names of key contacts. Finally, Chapter 6 lists a variety of research tools, including bibliographies, data bases, directories, periodicals, and software.

35910 (SERI/SP–320-3396) **Fuels from microalgae.** Solar Energy Research Inst., Golden, CO (USA). Jun 1989. 36p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. Order Number DE88001192/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Many species of aquatic plants can provide a source of renewable energy. Some species of microalgae, in particular, produce lipids – oils that can be extracted and converted to a diesel fuel substitute or to gasoline. Since 1979 the Aquatic Species Program element of the Biofuels Program, has supported fundamental and applied research to develop the technology for using this renewable energy resource. This document, produced by the Solar Technical Information Program, provides an overview of the DOE/SERI

Aquatic Species Program element. Chapter 1 is an introduction to the program and to the microalgae. Chapter 2 is an overview of the general principles involved in making fuels from microalgae. It also outlines the technical challenges to producing economic, high-energy transportation fuels. Chapter 3 provides an overview of the Algal Production and Economic Model (APEM). This model was developed by researchers within the program to identify aspects of the process critical to performance with the greatest potential to reduce costs. The analysis using this model has helped direct research sponsored by the program. Finally, Chapter 4 provides an overview of the Aquatic Species Program and describes current research. 28 refs., 17 figs.

35911 (SERI/STR–211-3511) **Two-terminal $CuInSe_2$-based cascade cells: Annual subcontract report, 16 January 1987–15 January 1988.** Birkmire, R.W.; McCandless, B.E.; Phillips, J.E. Solar Energy Research Inst., Golden, CO (USA); Delaware Univ., Newark, DE (USA). Inst. of Energy Conversion. May 1989. 28p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. Order Number DE89009422/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Results and conclusions from the first year of a two year research program on multijunction thin-film solar cells utilizing a $CuInSe_2$ heterojunction for the low band gap (E_g = 1.8 eV) or a CdTe (E_g = 1.5 eV) heterojunction for the high band gap component in a monolithic two-terminal cascade structure are reported. Physical vapor deposition with extrinsic doping was studied as a preparation technique for depositing low resistivity p-type CdTe on transparent ohmic contact materials at low temperature (T < 300°C). Photochemical vapor deposition was used to deposit a-Si cells. The presence of a $CuInSe_2$/(CdZn)S cell in the a-Si deposition reactor did not introduce contaminants or adversely affect the performance of conventional p-i-n cells. Procedures for fabricating monolithic cascade structures devices having the configuration ITO/a-Si(n-i-p)/ZnO/(CdZn)S/$CuInSe_2$/Mo/glass were developed. A prototype two-terminal cascade structure had an open circuit voltage over 1 volt. 8 refs., 6 figs., 7 tabs.

35912 (SERI/STR–211-3519) **Polycrystalline cadmium telluride n-i-p solar cell: Annual subcontract report, 1 June 1987–31 August 1988.** Meyers, P.V. Solar Energy Research Inst., Golden, CO (USA); Ametek Applied Materials Lab., Harleysville, PA (USA). Jun 1989. 58p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. Order Number DE89009437/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

The CdS/CdTe/ZnTe n-i-p solar cell and its ternary relatives have the potential to meet Department of Energy cost, efficiency, and stability goals. This report describes results of a continuing program to achieve these goals. A record-breaking efficiency of 11% has been demonstrated and verified at the Solar Energy Research Institute (SERI). Stability testing for 3000 hours indicates that the n-i-p structure is stable. Improving the short-circuit current by substituting $Cd_xZn_{1-x}S$ for CdS has been successful and has produced 8+% efficient cells with 2.6 eV windows using improved pyrolysis equipment. Transparent n-i-p devices have been produced with a SERI-verified efficiency of 9.4%. Collaborations with researchers at the Georgia Institute of Technology, the Institute of Energy Conversion, and Jet Propulsion Laboratory have resulted in jointly produced n-i-p cells. Cells produced by molecular beam epitaxy and metal organic chemical vapor deposition had efficiencies greater than 9%; cells produced by thermal vacuum evaporation had efficiencies greater than 7%. 18 refs., 35 figs., 13 tabs.

35913 (SERI/STR–211-3523) **Materials analysis and device optimization of $CuInSe_2$ solar cells: Annual subcontract report, 16 January 1987–15 January 1988.** Birkmire, R.W.; Phillips, J.E.; Shafarman, W.N. Solar Energy Research Inst., Golden, CO (USA); Delaware Univ., Newark, DE (USA). Inst. of Energy Conversion. Jun 1989. 62p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. Order Number DE89009434/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This report presents results and conclusions from the first year of research on $CuInSe_2$ thin-film solar cells. The research was carried out in two tasks: materials preparation and analysis and high-efficiency solar cell fabrication and analysis. $CuInSe_2$ thin films were prepared by vacuum evaporation of elemental Cu, In, and Se onto heated substrates. Systematic studies of the effects of incident flux and substrate temperature on $CuInSe_2$ film composition and morphology are presented. Mirror-smooth $CuInSe_2$ films were prepared using a newly developed aqueous bromine solution as chemical polishing etch. Heterojunctions photovoltaic devices with (CdZn)S, ITO/(CdZn)S, ZnO, and ZnO/(CdZn)S window layers were fabricated and analyzed. The dominant recombination mechanism in high-efficiency $CuInSe_2$ devices was found to be space-charge recombination in the $CuInSe_2$. Optimized one-square-centimeter $CuInSe_2$/(CdZn)S solar cells with efficiencies greater than 10% were fabricated. 17 refs.

35914 (SERI/STR–211-3528) **Research on stable, high-efficiency, large-area, amorphous-silicon-based submodules, Task B: Semiannual subcontract report, 16 March 1988–15 September 1988.** Delahoy, A.E.; Kampas, F.J. Solar Energy Research Inst., Golden, CO (USA); Chronar Corp., Princeton, NJ (USA). Jun 1989. 48p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. Order Number DE89009439/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This research concerns the improvement of the efficiency and stability of large-area amorphous silicon photovoltaic submodules, based on both single- and tandem-junction device structures. For the improvement of cell efficiency, carbon-graded a-Si_xC_{1-x}:H p-layers, ITO/Ag back reflectors, alternate SnO_2 substrates, and TiO_x recombination layers at the n/p interface of tandem cells are described. Significant contributions to the study of transport and defect states in a-Si:H were made using the steady-state photocarrier grating technique, charge collection in thick p-i-n structures, thermally stimulated currents, and current DLTS. An extensive study of the deposition of SiO_2 barrier layers on soda lime glass to improve SnO_2:F conductivity is reported. Submodule research includes laser isolation, active scribe tracking, post-fabrication defect removal, and a new interconnect scheme employing two levels of metallization. Power output and aperture area efficiency for single junction submodules were 5.9W (7.0%) for 1 × 1 sq. ft. and 17.7W (6.9%) for 1 × 3 sq. ft. Outdoor stability tests on glass-glass encapsulated tandem submodules are also described.

35915 Applications of inclusion in separation science. Atwood, J.L. (Univ. of Alabama, AL (US)). v.v of Chemical separations. King, J.C.; Navratil, J.D. Litarvin Literature, Arvada, CO (1986). (CONF-860411–: 1. international conference on separations science and technology, New York, New York, USA, 15-17 Apr 1986).

Inclusion compounds have a long history of association with separation science. The host-guest concept has many desirable features, but the solids-handling problems have been difficult to overcome. In this review, the past work done on Werner coordination complexes, urea, and cyclodextrins is highlighted. New work on liquid clathrates is emphasized for the future.

35916 High temperature flood injury of woody swamp seedlings. Donovan, L.A. (Univ. of Utah, Salt Lake City, UT (US)); Stumpff, N.J.; McLeod, K.W. *Bulletin of the Ecological Society of America (USA)*, 68(3): 293 (Jul 1987). (CONF-870835–: 72. annual meeting of the Ecological Society of America, Columbus, OH, USA, 9-14 Aug 1987).

Seedlings in thermal effluent impacted swamp areas are exposed to varying combinations of elevated temperatures and flooding conditions. While species may be adapted to withstand flooded conditions, the addition of a high temperature stress may limit their ability to grow and survive. Bald cypress (Taxodium distichum (L.) Richard) and water tupelo (Nyssa aquatica L.) seedlings were exposed to simulated thermal effluents in a three month greenhouse study to examine various physiological responses. Flooding with ambient temperature (25 C) water had no effect on photosynthesis, transportation and root respiration rates, but decreased growth and tended to stimulate root ethylene production of both species. In addition to further growth reductions by the high temperature (40 C) flooded soil conditions, root respiration and ethylene production rates were decreased for both species and photosynthesis and transpiration were reduced for water tupelo seedlings. High temperature inhibition of ethylene production may be responsible for the observed reduction in morphological acclimation to flooding, hence limiting survival chances.

35917 Gas exchange characteristics of Pinus edulis and Juniperus monosperma. Barnes, F.J. (Los Alamos National Lab., Los Alamos, NM (US)). *Bulletin of the Ecological Society of America (USA),* 68(3): 259 (Jul 1987). (CONF-870835–: 72. annual meeting of the Ecological Society of America, Columbus, OH, USA, 9-14 Aug 1987).

A shift in the relative dominance of Pinus edulis and Juniperus monosperma is associated with a complex elevational gradient in northern new Mexico. The ecophysiological parameters contributing to this dominance pattern were studied by determining the gas exchange characteristics of the two species in response to temperature, light and water stress under controlled conditions. P. edulis has a higher photosynthetic capacity than J. monosperma, and has a tendency to form ecotypes with individuals from mesic sites having higher rates of carbon gain than xeric site individuals. J. monosperma is more drought-tolerant than P. edulis. As soil moisture decreases, zero carbon gain in J. monosperma occurs at a lower predawn leaf water potential (-4.6 MPa) than in P. edulis (-2.2 MPa). There is no significant difference between species in the temperature of peak carbon gain. J. monosperma has a significantly wider temperature optimum than P. edulis with the additional range being at high temperatures. The observed lower elevational limit of P. edulis coincides with its physiological tolerance of water stress as estimated by seasonal leaf carbon gain. Environmental limitations to the distribution of J. monosperma were not found at higher elevations where P. edulis is dominant.

35918 Canopy photography for assessment of local light environment of tropical forest trees and palms. Rich, P.M. (Los Alamos National Lab., Los Alamos, NM (US)); Clark, D.B.; Clark, D.A.; Oberbauer, S.F. *Bulletin of the Ecological Society of America (USA),* 68(3): 397 (Jul 1987). (CONF-870835–: 72. annual meeting of the Ecological Society of America, Columbus, OH, USA, 9-14 Aug 1987).

Crown light environments of juvenile trees were assessed using photographic techniques in primary tropical wet forest at La Selva Biological Station, Cost Rica. Hemispherical (fisheye) photographs were taken of the canopy above saplings of the emergent trees Lecythis ampla and Dipteryx panamensis and the subcanopy palms Welfia georgii and Iriartea gigantea. Negatives were video digitized and computer analyzed to estimate direct and diffuse components of light entering through openings in the canopy. Results from analyses of canopy photographs were calibrated using results of quantum sensor studies. Growth rates were directly related to inferred light availability. Changes in growth rates from year to year were associated with changes in canopy openings. Asymmetry of canopy openings resulted in substantial intracrown variability in quantum sensor measurements.

35919 Plant photosynthetic pathways and grazing by phytophagous orthopterans. Pinder, J.E. III (Savannah River Ecology Lab., Aiken, SC (US)); Jackson, P.R. *Bulletin of the Ecological Society of America (USA),* 68(3): 387-388 (Jul 1987). (CONF-870835–: 72. annual meeting of the Ecological Society of America, Columbus, OH, USA, 9-14 Aug 1987).

The hypothesis that phytophagous orthopterans avoid consuming C4 plants in preference for C3 plants was tested by comparing the carbon isotope ratios of orthopterans to that expected for proportional consumption of plants in two old-field communities. The species composition of the plant community allowed valid tests of avoidance for only 10 of the 18 abundant orthopteran species. Six species demonstrated C4 avoidance, whereas three species fed on C4 plants and avoided C3 plants. One species consumed C3 and C4 plants in proportion to their abundance in the plant community. Problems involved in testing the C4 avoidance hypothesis under field conditions are discussed.

35920 Cedar barrens. Parr, P.D. (Oak Ridge National Lab., Oak Ridge, TN (US)); Pounds, L.R. *Bulletin of the Ecological Society of America (USA),* 68(3): 384 (Jul 1987). (CONF-870835–: 72. annual meeting of the Ecological Society of America, Columbus, OH, USA, 9-14 Aug 1987).

Oak Ridge National Environmental Research Park staff are working with the Tennessee Department of Conservation and Boeing Tennessee, Inc. to preserve and monitor an area containing one of the best known remaining examples of the rare cedar barrens plant community. Several rare plant species occur on the site and research has been initiated on Agalinis auriculata which is under consideration for federal listing. Preliminary data collected in 1984 has demonstrated an increase in Agalinis with movement out of the sampling grid area. Of 132 plants sampled in 1986, the Agalinis was found most often in a moss substrate (43%), on bare ground (28%) and in grass litter (23%). preliminary germination studies indicate it is an early spring germinating summer annual. Research has been initiated to determine seed bank information, germination requirements, seedling survival, and insect predation.

35921 Measurement of SO_2 uptake and redistribution of sulfur in a pine canopy using ^{35}S. Murphy, C.E. Jr. (E.I. du Pont de Nemours and Co., Savannah River Lab., Aiken, SC (US)); Gay, D.W. *Bulletin of the Ecological Society of America (USA),* 68(3): 374 (Jul 1987). (CONF-870835–: 72. annual meeting of the Ecological Society of America, Columbus, OH, USA, 9-14 Aug 1987).

Branches of loblolly pine were exposed to sulfur-35 dioxide in the field with a portable chamber. The exposed branches were excised and a sample of needles was immediately washed with distilled water. The needles and water collected in the field were analyzed for sulfur-35 content. The results indicated that a portion of the sulfur-35 could be washed from the needles and another portion was not removed with the water rinse. The portion that could not be removed by water rinsing was absorbed in a manner that suggested absorption by stomatal diffusion, and thus was internal. The sulfur-35 that could be removed by rinsing appeared to be surface absorption. An analysis of the distribution of sulfur-35 by serial extractions indicated that shortly after internal absorption, the sulfur-35 was equally distributed between material extracted with acetone, with hexane, and the fraction not removed by these two extractions.

35922 Free life history strategies. Loehle, C. (Savannah River Ecology Lab., Aiken, SC (US)). *Bulletin of the Ecological Society of America (USA),* 68(3): 353 (Jul 1987). (CONF-870835–: 72. annual meeting of the Ecological Society of America, Columbus, OH, USA, 9-14 Aug 1987).

Current life history theory is dominated by the r-K continuum, originally developed for animals. Because plants are sessile and plastic in their growth, the r-K model is inadequate. A new model is developed for plants in which the major tradeoff is between fast growth and defense of tissues. Plants at either end of the spectrum may have large numbers of seeds, or not. Interactions between defensive investments and shade tolerance, growth rate, longevity, and age of maturity are explored with data on 158 species of North American trees.

35923 GIS and remote sensing as tools for detection of landscape pattern and processes. Iverson, L.R. (Illinois Natural History Survey, Champaign, IL (US)); Cook, E.; Graham, R.L. *Bulletin of the Ecological Society of America (USA),* 68(3): 330 (Jul 1987). (CONF-870835–: 72. annual meeting of the Ecological Society of America, Columbus, OH, USA, 9-14 Aug 1987).

The Illinois Geographic Information System is equipped for GIS and image analysis which allows pursuit of many specific landscape-level questions. By overlaying historic vegetation maps with current maps, one can assess the factors contributing to long-term land-use change. GIS processing also provides for rapid determination of the suitability or susceptibility of phenomena occurring on landscapes. Examples of this type of processing include susceptibility to erosional soil loss or to crop yield reduction from droughts, and the suitability of various landscapes to provide adequate habitat for endangered plant species. The coupling of GIS processing with image analysis of satellite data provides a means for detecting changes and processes within landscapes. Some significant relationships have been uncovered, for example, among Landsat TM spectral data, site landscape variable, and ground-obtained forest productivity estimates.

35924 Net throughfall chemistry and atmospheric deposition at two forests of different elevations. Schaefer, D.A. (Oak Ridge National Lab., Oak Ridge, TN (US)); Lindberg, S.E. *Bulletin of the Ecological Society of America (USA),* 68(3): 408 (Jul 1987). (CONF-870835–: 72. annual meeting of the Ecological Society of America, Columbus, OH, USA, 9-14 Aug 1987).

We are measuring atmospheric deposition and throughfall chemistry at two coniferous sites. The higher (1800m) site is a red spruce (Picea rubens) forest; the lower (300m) is a loblolly pine (Pinus taeda) forest. Summed net chemical fluxes in throughfall (calculated as throughfall depth X concentrations minus rain depth X concentrations) are compared for April through July. Net fluxes of SO_4^{2-}, NO_3^-, Na^+, and Cl^-, in throughfall are greater at the spruce site. Net fluxes of K^+ and NH_4^+ in throughfall are greater at the pine site. Net fluxes of Ca_2^+ and Mg_2^{+4} are nearly equal. Air concentrations and surrogate surface fluxes are quite similar between sites, except for higher NO_3^- particle flux at the spruce site. Greater net throughfall fluxes at the spruce site reflect both greater canopy surface area, and cloud deposition to this site. Greater net K^+ flux at the pine site reflects canopy losses. Negative NH_4^+ flux indicates spruce canopy uptake.

35925 (DOE/CH/10093–46) **Solar thermal program summary: Volume 2, Research summaries: Fiscal year 1988.** Solar Energy Research Inst., Golden, CO (USA). May 1989. 90p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. Order Number DE89000861/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

The Solar Thermal Program Summary for Fiscal Year 1988 is a two- volume reference set describing the technological advances and future research and development (R&D) direction of the Solar Thermal Technology Program. Volume I contains capsule descriptions of the various activities undertaken in the year, a brief history of the program, and the significant accomplishments realized. It also describes the management framework for the program and sets forth the FY 1988 budget. Volume II consists mainly of a compilation of detailed descriptions of the various R&D activities performed by the national laboratories and their subcontractors from industry, academia, and nonprofit research institutions. It also contains a bibliography of the various publications produced under the program in recent years.

35926 (SAND–89-7027) **An improved design for stretched-membrane heliostats.** Beninga, K.; Butler, B.; Sandubrae, J.; Walcott, K. Sandia National Labs., Albuquerque, NM (USA); Science Applications International Corp., San Diego, CA (USA). Energy Projects Div. Jun 1989. 184p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC04-76DP00789. Order Number DE89013872/JAW. Available from NTIS, PC A09/MF A01 - OSTI; GPO Dep.

Science Applications International Corporation (SAIC) has developed an improved stretched-membrane heliostat mirror module under contract to Sandia National Laboratories, Albuquerque, New Mexico. Both a 150-m^2 commercial mirror module and a 50-m^2 prototype mirror module have been designed. The prototype mirror module has been fabricated and is being tested at the Central Receiver Test Facility (CRTF) in Albuquerque. Two .0762-mm (.003-in) thick stainless steel membranes are stressed to approximately 90 MPa (13,000 psi) and welded to either side of a carbon steel, rectangular cross-section ring, which is compressed to approximately one-tenth of its yield strength. The ring is supported by five trusses, which radiate from a central hub. The mirror module is mounted on a conventional pedestal drive system for sun-tracking purposes. The mirror module is air-tight, and focusing is achieved by modulating the position of the back membrane. The ring stiffness and tolerance achievable by conventional manufacturing methods dictate the ring distortions prior to installation of the mirror module. Once the mirror module is installed, wind loads on the heliostat exert additional out-of-plane loads. A comprehensive finite-element computer model of the mirror module was used for the structural design of the ring/membrane system and truss supports. The analysis and design methods used are reported, and an improved mirror module design is described. Preliminary test results indicate the prototype mirror module meets all design performance goals. The unit has a full cone angle reflected beam dispersion of 2.8 mrad and can defocus in five seconds. 25 refs., 77 figs., 17 tabs.

1409 Solar Thermal Utilization

35927 (DOE/SF/16306–15) **Colorado State University program for developing, testing, evaluating and optimizing solar heating and cooling systems: Project status report for the months of May and June 1989.** Colorado State Univ., Fort Collins, CO (USA). Solar Energy Applications Lab. Jul 1989. 18p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract FG03-86SF16306. Order Number DE89014525/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Cooling performance analysis of the data collected over the past four years in the research and development of the SENC solid desiccant cooling system is nearing completion. Computer models are being developed of two system designs: (1) the present system configuration with constant collector flow rate and one mixed storage tank, and (2) the proposed system with variable collector flow to maintain constant collector outlet temperature and two storage tanks (complete thermal stratification). These models are expected to reveal the annual heating system performance difference which will be realized by changing to constant collector temperature operation in Solar House I. Also the model will provide optimization with respect to storage tank temperature settings, load side heating capacity, etc.

35928 (AD-A–205076/3/XAB) **Transparent glass ceramics doped by chromium(III) and chromium(III) and neodymium(III) as new materials for lasers and luminescent solar concentrators. Final report, 1 October 1985-30 June 1988.** Reisfeld, R. Hebrew Univ., Jerusalem (Israel). Dept. of Inorganic and Analytical Chemistry. 27 Dec 1988. 41p. Available from NTIS, PC A03/MF A01.

Transparent glass ceramics doped by chromium (III) and codoped by chromium (III) and neodymium (III) having the structure of spinel, gahnite, petalite and mullite were prepared. Steady-state spectroscopy (absorption and emission) as well as time-resolved spectroscopy were studied at room temperature and varying temperatures down to that of liquid helium. Quantum efficiency of chromium (III) at room temperature is high, between 0.9 and 1.0, in mullite glass ceramics. Cross sections for laser and laser threshold were calculated. The potential application of these materials for tunable lasers in the red and near infrared is described.

35929 (DOE/CE/15289–T1) **Development of a carbonaceous selective absorber for solar thermal energy collection and process for its formation: Final report.** Garrison, J.D. San Diego State Univ., CA (USA). Dept. of Physics. 25 Feb 1989. 23p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract FG01-86CE15289. Order Number DE89008587/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The main goal of the US Department of Energy supported part of this project is to develop information about controlling the complicated chemical processes involved in the formation of a carbonaceous selective absorber and learn what equipment will allow production of this absorber commercially. The work necessary to accomplish this goal is not yet complete. Formation of the carbonaceous selective absorber in the conveyor oven tried so far has been unsatisfactory, because the proper conditions for applying the carbonaceous coating in each conveyor oven fabricated, either have been difficult to obtain, or have been difficult to maintain over an extended period of time. A new conveyor oven is nearing completion which is expected to allow formation of the carbonaceous selective absorber on absorber tubes in a continuous operation over many days without the necessity of cleaning the conveyor oven or changing the thickness of the electroplated nickel catalyst to compensate for changes in the coating environment in the oven. Work under this project concerned with forming and sealing glass panels to test

ideas on evacuated glass solar collector designs and production have been generally quite satisfactory. Delays in completion of the selective absorber work, has caused postponement of the fabrication of a small prototype evacuated glass solar collector panel. Preliminary cost estimates of the selective absorber and solar collector panel indicate that this collector system should be lower in cost than evacuated solar collectors now on the market. 4 figs.

35930 (SERI/SP–220-3237) **Progress in parabolic dish technology.** Stine, W.B. Solar Energy Research Inst., Golden, CO (USA). Jun 1989. 52p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. Order Number DE89009427/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This report describes the current status of parabolic dish technology. Its purpose is to communicate the principal outcomes of DOE's parabolic dish technology R&D efforts carried out at the Solar Energy Research Institute; Sandia National Laboratory, Albuquerque; the Jet Propulsion Laboratory; and other DOE national laboratories. It is written for those in industry, academia, and government who have a special interest in solar thermal systems that use parabolic dishes as collectors. The evolution of parabolic technology is described, and examples of projects in operation and under construction are included. Solar thermal dish technology can supply either electric or thermal energy to various applications over a broad range of system sizes and temperatures. These solar energy systems will be available by the time this country needs additional electric generation capacity – in the mid to late 1990s – at costs competitive with other energy sources. 9 refs., 54 figs., 6 tabs.

A rock heat installation for a detached house has been equipped with a simple, cylindrical air and solar heat exchanger to charge the rock store, primarily during the six summer months. Preliminary results from 9 months of measurements indicate that the air heat exchanger decreases the load of the rock heat collector by approximately 6000 kWh annually, of which 3000 kWh is actively charged into the rock during the summer months. The rock heat output without an air heat exchanger is otherwise 18,000 kWh annually. The air heat exchanger yields approximately 4^0C higher brine solution temperatures during autumn and spring, and approximately 5-9^0C higher temperatures in the summer. In the winter, there is no marked rise in brine solution temperature, and the performance of the rock heat collector will be decisive for the operation of the heat pump. The heat pump's performance has risen 10-15%, i.e. the annual operating time has been reduced from approximately 3500 h/y without the air heat exchanger to below 3200 h/y. 6 refs., 2 figs., 3 tabs.

A unified analysis and parametric study of Central Solar Heating Plants with Seasonal Storage(CSHPSS) systems has recently been compiled. The study culminated nearly three years of information collection, evaluation, preliminary design and analysis, and system simulation. It included systems with stationary and tracking collector arrays; water tank, rock cavern, water pit, drilled earth and rock fields, and natural aquifers storage subsystems; heat pump and direct coupled loads, and loads representing 50 to 5000 residential units with domestic hot water fractions ranging from 20 to 50%. Each configuration was independently optimized using the Swedish IEA-developed computer code MINSUN. Results of the unified study indicate that a number of CSHPSS configurations are economically competitive with conventional plants now and are clearly economically superior to diurnal solar systems. Additional studies are now in progress that will verify these findings in the context of specific national economies and climates. 1 refs., 6 figs., 1 tab.

35933 (ITL–8509, pp. 455-460) **The Vaulruz project experimental results.** Hadorn, J.C. (SORANE S.A., Lausanne, Switzerland); Chuard, P.; Chuard, D. Intertask Ltd., Ottawa, ON (Canada). 1985. This paper presents some experimental results concerning a solar heating plant with seasonal heat storage and heat pump in Vaulruz, Switzerland. It is basically a solar heating plant (550 m^2 of double glazed flat plate roof integrated solar collectors), a seasonal storage of heat (3500 m^3 of earth, with plastic tubes and insulation), an electrically driven 44 kW heat pump, and an auxiliary oil burner. The total annual load in 1984 was 450 MWh covered up to 72% by the heat pump, 19% by the oil burner, and 9% directly by the solar collectors or the storage. The monitoring approach is described and the results from March 1983 to December 1984 are presented. The system components behave as expected (high annual collector efficiency, storage temperature as foreseen), except the heat pump, which is expected to be improved by the manufacturer. 2 refs., 7 figs.

Calculations and theoretical system design of a central solar heating plant with seasonal storage (CHSPSS) in Poland have been carried out. The mathematical models describing heat transfer between the different elements (store, district heating system, collector piping system, and heating installations in houses) and the surroundings, take into consideration the dynamics of these elements using the theory of linear systems. For each of these elements, response functions are theoretically estimated based on climatic parameters for a test reference year, temperature of the working fluids, etc. The discrete functions describing heat transfer between the elements and the surroundings as a function of time are determined using the convolution theorem. This method results in very fast and detailed simulation of CSHPSS performance over a long period of time. The design problem (exemplified by an estate consisting of

200 single-family houses) is treated as a multi-level optimization task. 5 refs., 5 figs.

35935 (ITL–8509, pp. 421-425) **The Lyckebo rock cavern seasonal storage plant experience of one year of operation.** Brunstroem, C. (Swedish State Power Board, Aelvkarleby, Sweden); Larsson, M.; Holst, P.; Zinko, H.; Hillstroem, C.-G. Intertask Ltd., Ottawa, ON (Canada). 1985. (In English and French). (CONF-850905–: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG–89-00267). In *Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The main objective of the Lyckebo project is to develop and demonstrate a large-scale solar district heating system with seasonal storage in a rock cavern. Performance data from one year of operation with the plant were measured. An annual collector field heat production of 287 kWh/m^2 at a mean operating temperature of 62^{0}C was obtained. The corresponding global collector plane irradiation was 989 kWh/m^2 resulting in a collector field efficiency of 29%. The storage heat loss during the year amounted to 3.14 GWh, corresponding to 26% of the heat production. The annual energy-weighted loading and unloading mean temperatures, measured in the interconnecting culvert, were 84 and 62^{0}C respectively, giving storage mean temperature maximum and minimum values of 68 and 45^{0}C respectively during one storage cycle. The energy efficiency obtained for a complete storage cycle was 0.74. The performance results showed that effective production and storage of solar energy is possible with highly efficient flat plate collectors and rock cavern seasonal storage, although not yet economically competitive. 7 refs., 6 figs., 3 tabs.

35936 (ITL–8509, pp. 437-442) **A solar heating plant with heat pump and seasonal storage. System design influence on thermal performance and economy.** Dalenbaeck, J.-O. (Chalmers Univ. of Technology, Gothenburg, Sweden). Intertask Ltd., Ottawa, ON (Canada). 1985. (In English and French). (CONF-850905–: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG–89-00267). In *Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The solar heating plant in Lambohov was built primarily as an experimental installation for large-scale solar heating applictions in Sweden. It consists of 2800 m^2 of flat plate roof-integrated solar collectors, and an insulated 10,000 m^3 water pit in rock combined with heat pumps for seasonal storage. The design objective was to meet 100% of the annual heating requirements of 55 terraced houses with a solar energy coverage of 85%. Comprehensive measurements of system performance were made during 1983. One of the results of this work was to show that the solar energy coverage amounted to about 70%. The heat losses from the storage were higher than expected during the design stage due to penetration of ground water into the insulation. This paper presents general conclusions concerning solar heating technology and economy. System design calculations have been made and one of the main results is to show that the solar energy coverage could be the same for a system design without heat pumps. The economic results consider both the actual solar enegy heating costs achieved and the estimated costs for a similar plant built today without heat pumps, and shows promising low energy costs. 4 refs., 2 figs., 2 tabs.

An experimental residential heating facility has been designed consisting of solar collectors, low-temperature heat storage provided by a tank containing 7 m^3 of glycol solution, and a glycol solution-to-air heat pump. Programs in 1983 and 1984 were conducted to systematically measure the following parameters: temperature, flow, pressure and electrical consumption. A theoretical study of the behaviour of each component considered separately (solar panels, storage tank and heat pump) was done for the purpose of developing a theoretical operational model of this system and preparing related simulation software. This model showed the predominant influence of the heat storage in the installation. A more thorough study of this storage was then conducted. This involved examination of the phenomenon of mixing of the various glycol solution layers in the tank and consideration of other more suitable storage methods (water-ice mixture). The paper establishes energy and economic balances for situations in which the following parameters vary: storage capacity, conduction coefficient of the walls, coefficient of stratification and percentage of ice in the glycol solution tank. 7 refs., 4 figs., 3 tabs.

35938 (DOE/ID/12549–1) **The hydrothermal system in central Twin Falls County, Idaho.** Lewis, R.E.; Young, H.W. Geological Survey, Boise, ID (USA). Water Resources Div.; Idaho Dept. of Water Resources, Boise, ID (USA). 1989. 44p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract FG07-84ID12549. (USGS-WRI–88-4152). Order Number DE89014219/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This report describes the results of a study to define the areal extent and thickness of the hydrothermal reservoir in Twin Falls County and to propose a generalized conceptual model of the system. Specific objectives of the study, done in cooperation with the Idaho Department of Water Resources, were to evaluate the existing resource as to its volume, temperature, pressure, and water chemistry, and to determine the effects of present development on the resource. The study was limited to Twin Falls County. Some geologic, geochemical, and hydrologic data for the hydrothermal system were available from earlier studies. However, information about the subsurface at depths greater than 1000 feet was sparse. One well for which data were available was drilled to 2525 feet; several others were drilled to depths between 1200 and 2200 feet. Direct-current electrical resistivity soundings conducted during the summer of 1985 as part of the study provided valuable information about the subsurface at depths less than about 6000 feet. Interpretation of computer-generated subsurface profiles constructed from the soundings provided the basis for determining the thickness of the Idavada Volcanics over much of the study area. 42 refs., 9 figs., 3 tabs.

35940 (LA-UR–89-1811) **An economic prefeasibility study of geothermal energy development at Platonares, Honduras.** Trocki, L.K. Los Alamos National Lab., NM (USA). 1989. 13p. Sponsored by DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-8903134–2: Circum-Pacific energy and minerals conference, San Jose, Costa Rica, 5-8 Mar 1989). Order Number DE89012634/JAW. Available from NTIS, PC A03/MF A01 - OSTI.

The expected economic benefits from development of a geothermal power plant at Plantanares in the Department of Copan, Honduras are evaluated in this report. The economic benefits of geothermal plants ranging in size from a 10-MW plant in the shallow reservoir to a 20-, 30-, 55-, or 110-MW plant in the assumed deeper reservoir were measured by computing optimal expansion plans for each size of geothermal computing optimal expansion plans for each size of geothermal plant. Savings are computed as the difference in present value cost between a plan that contains no geothermal plant and one that does. Present value savings in millions of 1987 dollars range from $25 million for the 10-MW plant to $110 million for the 110-MW plant – savings of 6% to 25% over the time period 1988 through 2008. The existence of the shallow reservoir is relatively well-characterized, and much indirect scientific evidence indicate the existence of the deeper reservoir. Based on probability distributions estimated by geologists of temperature, areal extent, depth, and porosity, the expected size of power plant that the deep reservoir can support was estimated with the following results: O-MW – 16% (i.e., there is a 16% chance that the deep reservoir will not support a power plant); 20-MW – 38%; 30-MW – 25%; 55-MW – 19%; and 110-MW – 2%. When the cost savings from each size of plant are weighted by the probability that the reservoir will support a plant of that size, the expected monetary value of the deep reservoir can be computed. It is $42 million in present value 1987 dollars – a cost savings of 10%. The expected savings from the 10-MW plant in the shallow reservoir are expected to be close to the computed value of $25 million, i.e., the probability that the shallow reservoir can support the plant is high. 4 refs., 3 figs., 2 tabs.

35941 (LA-UR–89-1878) **A discrete fracture model for a hot dry rock geothermal reservoir.** Robinson, B.A. Los Alamos National Lab., NM (USA). 1989. 14p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract W-7405-ENG-36. (CONF-8906142–1: International hot dry rock (HDR) geothermal energy conference, Camborne, UK, 27-30 Jun 1989). Order Number DE89013462/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Modeling results are presented for the Fenton Hill Phase II reservoir using a two-dimensional steady state simulator of fluid flow and solute transport in fractured porous media. Fluid flow and tracer response data are simulated using a fracture flow model in which the fracture apertures are string functions of pressure. The model is used to match the available steady state data of pressure drop versus flow rate and the tracer data. Various schemes for improving reservoir performance, such as high backpressure, chemical etching, stimulation using a viscous fluid, and the drilling of a second production wellbore, are then examined. 15 refs., 7 figs., 4 tabs.

35942 (LA-UR–89-2129) **Reservoir water loss modeling and measurements at Fenton Hill, New Mexico.** Brown, D.W. Los Alamos National Lab., NM (USA). 1989. 12p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract W-7405-ENG-36. (CONF-8906142–2: International hot dry rock (HDR) geothermal energy conference, Camborne, UK, 27-30 Jun 1989). Order Number DE89014222/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

An extensive series of pressurized reservoir water loss experiments are presently being conducted in the deeper Phase II reservoir, at the Laboratory's Fenton Hill site in north-central New Mexico. The objectives of these experiments are: to measure the reservoir water leak-off rate at a number of equilibrium reservoir pressure levels, and as a function of time; and with this pressure- and time-dependent water-loss data, to determine the joint dilation (i.e., mean joint porosity) of the reservoir as a function of pressure up to about 24 MPa (as measured at the surface). The permeability model of Gangi has been used to explain the Phase II reservoir water loss as measured during two reservoir flow tests of 7 and 30 days duration. During the 30-day flow test, the model strongly suggests that the reservoir was actively growing by fracture extension, even at injection pressures as low as 27 MPa, which is confirmed by our seismic observations. 3 refs., 6 figs., 1 tab.

35943 (SAND–89-0079) **PDC [polycrystalline diamond compact] bit research at Sandia National Laboratories.** Finger, J.T.; Glowka, D.A. Sandia National Labs., Albuquerque, NM (USA). Jun 1989. 76p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC04-76DP00789. Order Number DE89013885/JAW. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

From the beginning of the geothermal development program, Sandia has performed and supported research into polycrystalline diamond compact (PDC) bits. These bits are attractive because they are intrinsically efficient in their cutting action (shearing, rather than crushing) and they have no moving parts (eliminating the problems of high-temperature lubricants, bearings, and seals.) This report is a summary description of the analytical and experimental work done by Sandia and our contractors. It describes analysis and laboratory tests of individual cutters and complete bits, as well as full-scale field tests of prototype and commercial bits. The report includes a bibliography of documents giving more detailed information on these topics. 26 refs.

16 TIDAL AND WAVE POWER

1605 Environmental Aspects

35944 (ETSU-TID–4055-P2) **Wader migration and distribution in South West estuaries. V. 2. Appendices.** UKAEA Harwell Lab. (UK). Energy Technology Div.; British Inst. for Ornithology, Tring (UK). 1989. vp. Available from British Library, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

Two sets of data tables relating to a study of the potential effect on wading birds and wildfowl of a tidal barrage on the River Severn are presented. The first set records recoveries of ringed birds of six species which indicate the origins of waders and wildfowl using the Severn estuary. The second set records the distribution of fifteen species feeding on the mudflats of the Severn estuary. (U.K.).

35945 (ETSU-TID–4059) **Prediction of post barrage densities of shorebirds. V. 4. Birds.** Goss-Custard, J.D.; McGrorty, S.; Pearson, B.; Clarke, R.T.; Rispin, W.E.; Durell, S.E.A.leV. dit; Rose, R.J. UKAEA Harwell Lab. (UK). Energy Technology Div.; Natural Environment Research Council, Plymouth (UK). Plymouth Marine

Lab. 1989. 134p. Available from British Library, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

This study was designed to test whether or not the densities of shore-birds post-barrage on the River Severn could be predicted from (a) the predicted densities of the main prey species and (b) the predicted values of shore-width, shear-strength of the sediments and exposure time (physical variables). The methodology was to regress bird densities against these variables across 40 sites situated in six estuaries, including the Severn. It was concluded that bird density was directly dependent on prey density. The physical variables had an additional effect in the case of only three of the eight bird species studied; time available for feeding had no effect on density. The relatively low invertebrate densities on the Severn estuary might be improved by a different pattern of sedimentation post-barrage leading to greater bird densities. It is not possible at present, however, to predict the post-barrage conditions sufficiently well.

35946 (ETSU-TID–4061) **Prediction of post barrage densities of shorebirds. V. 3. Invertebrates.** UKAEA Harwell Lab. (UK). Energy Technology Div.; Natural Environment Research Council, Plymouth (UK). Plymouth Marine Lab. 1989. 112p. Available from British Library, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

A comparative survey of the intertidal benthic invertebrate communities at 40 sites in estuaries in S.W. Britain has been undertaken. These estuaries include the Severn and five others which span the range of environmental conditions expected to occur in a post-tidal barrage Severn. Multivariate analysis of the invertebrate species abundance and biomass data showed that the fauna of the Severn estuary sites was significantly distinct from all the other estuaries, the latter forming a single cluster with few differences between them. In comparison with other estuaries, populations of several invertebrate species were dominated by small individuals in the Severn, suggesting a shorter lifespan. Of the bird species studied, only dunlin were indifferent to the invertebrate community composition, having similar densities per unit area in the Severn and other estuaries. Seven other species showed a preference for the invertebrate association characterising the other estuaries, and attained higher densities there. Qualitative predictions for the post barrage Severn include changes in invertebrate species composition and size distribution, and improved feeding conditions for all bird species studied, except dunlin.

35947 (ETSU-TID–4062-P1) **Prediction of post barrage densities of shorebirds. V. 1. Overview.** UKAEA Harwell Lab. (UK). Energy Technology Div. 1989. 22p. Available from British Library, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

The objective of this study was to develop models for predicting the densities of shorebirds after a tidal barrage is built. These models showed that, with the exception of Dunlin, the doubling of invertebrate prey density required in the existing feeding areas, to maintain the present numbers of birds in the Severn estuary, fall within the range of prey densities that already occur in other estuaries, so in principle could be achieved. An increase in the productivity of areas that are little used at present, or creation of new areas, could further increase the capacity of the estuary as a whole to support the necessary bird numbers. Whether this will happen, however, depends on quantitative predictions of post-barrage invertebrate densities, which are not yet possible. Further studies are suggested to improve quantitative predictions of post-barrage densities of invertebrates and birds, particularly for Dunlin as the Severn is of such special significance to them.

35948 (ETSU-WN–4055-P1) **Wader migration and distribution in South West estuaries (in relation to the Severn Barrage). V. 1.** UKAEA Harwell Lab. (UK). Energy Technology Div.; British Inst. for Ornithology, Tring (UK). 1989. 277p. Available from British Library, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

A study has been undertaken with three main objectives: 1. to identify the origins and movement patterns of waders and wildfowl using the River Severn. 2. to evaluate the patterns of low tide usage of the estuary by waders and Shelduck and to identify preferred areas. 3. to evaluate the capacity of adjacent estuaries to absorb any waders displaced from the Severn by a barrage. These objectives were achieved by both computer analysis of existing British Trust for Ornithology data and the collection of new field data. Overall four key species (Shelduck, Dunlin, Curlew and Redshank) occurring in internationally important numbers on the Severn are identified as most likely to be adversely affected by a barrage. It is unlikely that displaced birds of these species could be absorbed by other estuaries in southwest Britain.

1607 Tidal Power Plants

35949 (ETSU-TID–4048-P2) **River Loughor tidal power scheme. A feasibility study report.** Energy Technology Support Unit, Harwell (UK). 1989. vp. Available from British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

The potential for constructing a tidal power barrage on the river Loughor in South Wales has been explored. An optimum barrage would comprise four turbines and four sluices with an installed capacity of 5MW. While this would be technically feasible an examination of the costs involved have shown that it would not be economic. Lower unit costs for electricity generation might be achieved by constructing a multipurpose barrage with amenity benefits, but the implications of the water levels required and the effects on water quality need clarification. (U.K.).

35950 (ETSU-TID–4066-P1A) **Generic steel designs for tidal power barrages. V. 1, pt. 1.** UKAEA Harwell Lab. (UK). Energy Technology Div.; Steel Construction Inst., Ascot (UK). 1989. vp. Available from British Library, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

This report presents the results of a generic study into the use of steel for tidal power barrages. Volume I is in two parts, Part 1 contains the bench mark designs and costs for large, medium and small schemes and Part 2, the generic design data. The work demonstrates that steel structures can be designed for use in a marine environment with satisfactory design life for strength and durability. As well as being able to compete with other forms of construction for the look-alike designs, it is shown that when the attributes of steel, such as its high strength to weight ratio, are applied to the designs, more economical configurations are possible. The nature of a steel construction, having good floating characteristics thereby reducing installation constraints, permits very efficient designs which may not be possible with some lower strength to weight structural materials.

35951 (ETSU-TID–4066-P1B) **Generic steel designs for tidal power barrages. V. 1, pt. 2.** UKAEA Harwell Lab. (UK). Energy Technology Div.; Steel Construction Inst., Ascot (UK). 1989. vp. Available from British Library, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

This report presents the results of a generic study into the use of steel for tidal power barrages. 17 WIND ENERGY

1706 Wind Energy Engineering

35952 (SERI/TP–217-3505) **Three-dimensional airfoil performance measurements on a rotating wing.** Butterfield, C.P. Solar Energy Research Inst., Golden, CO (USA). Jun 1989. 5p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. (CONF-890717–2: European wind energy conference and exhibition, Glasgow, UK, 10-13 Jul 1989). Order Number DE89009443/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The objective of this comprehensive research program was to study the effects of horizontal-axis wind turbine (HAWT) blade rotation on aerodynamic behavior below, near, and beyond stall. This paper describes the flow angle sensor used to measure angle of attack (AOA) and how the sensor was calibrated, and it gives results of pressure integrations on the blade. Aerodynamic, load, flow-visualization, and inflow measurements were made on a 10-m, three-bladed, downwind HAWT. A video camera was mounted on the rotor to record video images of tufts attached to the low-pressure side of a constant-chord, zero-twist blade. Load measurements were made using strain gages mounted every 10% of the blade's span. Pressure taps were located at 32 chordwise positions and revealed pressure distributions comparable with wind tunnel data. Inflow was measured using a vertical-plane array of eight propvane and five triaxial (U-V-W) prop-type anemometers located 10 m upwind in the predominant wind direction. Results show evidence of stall hysteresis and unsteadiness at high AOA. Correlations with analytical predictions and wind tunnel tests show good agreement at low AOA and poor agreement at high AOA. 7 refs., 12 figs.

35953 (EMR–M91-7/30-1988E) **Waste heat recovery in remote communities. A shared opportunity.** Department of Energy, Mines and Resources, Ottawa, ON (Canada). 1988. 133p. (MICROLOG–89-02005). Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This elementary report is intended to assist residents of remote communities, utilities, and governments in developing the potential of the rejected heat from diesel-electric generating plants. It describes briefly the components of a waste heat recovery/distribution (WHR/D) system, as well as the benefits of utilizing recovered heat. It describes the WHR/D system installed at the Attawapiskat (Ontraio) Hospital, discusses the planning, construction, and operational phases of a WHR/D project, project management (work sharing, etc.), the financial evaluation of a project, and the economic and social impacts on the community. The report addresses a typical project from a technical standpoint, describing the value of feasibility studies, and the planning and processes involved in project management, such as engineering design, procurement, construction, and commissioning. Finally, it deals with agreements and contracts. 3 refs., 20 figs., 1 tab.

35954 (EPRI-EL–4651-Vol.3) **Electromagnetic transients program (EMTP): Volume 3, Workbook III: Final report.** Alvarado, F.L. Electric Power Research Inst., Palo Alto, CA (USA); Wisconsin Univ., Madison, WI (USA). Dept. of Electrical and Computer Engineering. c Jun 1989. 147p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

This workbook is the third in a series of books intended to introduce the EMTP to users. It assumes that the user is familiar with elementary uses of the EMTP and presents more advanced modeling techniques. The workbook uses a case-study approach, where gradually more sophisticated models of the same system are introduced. This book covers mainly transformers, synchronous machines and induction motors. It includes a description of SSR (SubSynchronous Resonance).

35955 (EPRI-GS–6415) **A comparison of steam-injected gas turbine and combined-cycle power plants: Technology assessment: Final report.** Electric Power Research Inst., Palo Alto, CA (USA); Jersey Central Power and Light Co., Morristown, NJ (USA); Sargent and Lundy, Chicago, IL (USA). c Jun 1989. 459p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

This report presents the results of a site assessment study comparing steam-injected gas turbine units with combined-cycle plants. Three size categories were compared: a large plant class, nominally sized at 350-400 MW; and intermediate sized class, sized at 150 MW; and a single unit, small class nominally sized at 50-60 MW. The plants were evaluated at two Jersey Central Power and Light Company sites, one site located on a fresh water river and the other site located at a sea water site. Results of the study were reviewed and approved by a Utility Assessment Panel made up of senior utility executes. For the larger plants, 350-400 MW and 150 MW, the combined-cycle units showed a distinct economic advantage and would definitely be preferred over the steam-injected gas turbines. The economics for the small, single unit plants were much closer. The Utility Assessment Panel noted special operational benefits whereby the steam-injected gas turbine units may offer some advantage over the combined-cycle units for these small sized plants. 8 refs., 65 figs., 42 tabs.

35956 **Hybrid power system studied.** *JAPCA, International Journal of Air Pollution Control and Waste Management (USA),* 39(3): 373 (Mar 1989).

A hybrid power system that could cut electric costs by 20 percent and raise plant efficiencies to 45 percent or more is the subject of a $1.1 million study being conducted by M.W. Kellogg of Houston, Texas, for the US Department of Energy. The hybrid system uses both coal gasifier and a pressurized fluidized-bed coal (FBC) combustor to drive a high-efficiency gas turbine-generator to produce electricity. The system relies on a high velocity transport process. The gasifier converts part of the coal into a low-Btu combustible hot gas that is cleaned and sent to the turbine. The remaining coal goes to the FBC combustor in the form of char which is burned under pressure, in a rapid motion resembling a moving fluid, to produce a second source of hot gas for the turbine. By transferring the coal's heat energy directly to the turbine, the gasifier-combustor combination system provides a substantial boost in power generating efficiency. In both vessels-the gasifier and FBC combustor-a sulfur absorbing substance such as limestone is added to remove most of the sulfur pollutants. Any remaining pollutants, such as particles of ash, are removed by high temperature cleanup systems operating between the vessels and the gas turbine.

35957 (DOE/PC/79856–T1) **Development of a membrane SO_x/NO_x treatment system: Final report, 28 April 1987–28 April 1988.** Membrane Technology and Research, Inc., Menlo Park, CA (USA). 1988. 41p. Sponsored by DOE Fossil Energy. DOE Contract AC22-87PC79856. Order Number DE89011416/JAW. Available from NTIS, PC A03/MF A01 - OSTI.

A polyamide copolymer composite membrane has been developed that has outstanding properties for the removal of sulfur dioxide from flue gas. The membrane is characterized by a sulfur dioxide/nitrogen selectivity of 250 and a sulfur dioxide/carbon dioxide selectivity of 10, while the sulfur dioxide permeation rate equals 6.1×10^{-3} $cm^3(STP)/cm^2 \cdot sec \cdot cmHg$. These membrane properties have been determined with a synthetic flue gas mixture containing 0.33% SO_2, 8.2% CO_2, 5.8% O_2, 68.1% N_2, and 17.6% H_2O at 60°C. This membrane, used in a system that employs a steam sweep stream to provide the driving force for permeation, makes it possible to reduce the sulfur dioxide content of flue gas from 0.33% to 0.05% (87% removal of sulfur dioxide) at an operating cost of less than 10 mill/kWh. At the end of the program, one small spiral-wound module containing the polyamide copolymer membrane was successfully made. 26 refs., 12 figs., 19 tabs.

35958 (DOE/PC/81012–T1-Pt.1-A) **5-MW Toronto HALT [Hydrate Addition at Low Temperature] pilot plant testing: Test results: Part 1-A.** Babu, M.; College, J.; Forsythe, R.; Kerivan, D.; Lee, K.; Herbert, R.; Kanary, D. Dravo Lime Co., Pittsburgh, PA (USA). Dec 1988. 165p. Sponsored by DOE Fossil Energy. DOE Contract AC22-85PC81012. Order Number DE89012483/JAW. Available from NTIS, PC A08/MF A01 - OSTI; GPO Dep.

"Hydrate Addition at Low Temperature" of HALT is a dry calcium-based hydrate injection process for the removal of SO_2 from flue gases off a sulfur bearing fuel. In this process the hydrate is pneumatically conveyed and injected into the flue gas stream as a dry particulate. The flue gas is cooled downstream of the hydrate injection location by spraying the gas with a stream finely atomized water droplets. The water is atomized into a fine spray mist by using air under pressure as the atomizing fluid. The spray nozzles are specially designed. A 5MW pilot HALT was designed, constructed and operated to demonstrate the viability of the HALT process. The unit was designed to use a baghouse for particulate removal. A rented ESP was used for a pre-scheduled test period for comparison with the baghouse. Tests were conducted to cover all of the following variables: humidification, stoichiometric ratio, approach temperature, flue gas velocity, inlet flue gas SO_2 concentration, and inlet flue gas temperature. Solids samples of hydrates disposal and ESP waste solids were chemically analyzed and are reported. Hydrate samples were analyzed for particle size distribution and surface area. A two month long duration test operating 24 hours/day was successfully concluded. EPA leachate tests were conducted on the solids waste. Corrosion tests were conducted on coupons installed in the baghouse. 79 figs., 5 tabs.

35959 (EPRI-GS–6382) **Design guidelines for a furnace sorbent injection waste management system: Final report.** Lees, M.G.; Saylor, D.K.; Schoedel, A.E.; Stewart, M.M. Electric Power Research Inst., Palo Alto, CA (USA); Baker/TSA, Inc., Coraopolis, PA (USA). c Jun 1989. 737p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Furnace Sorbent Injection (FSI) is a commercially available and applied retrofit technology used to control SO_2 emissions. This report presents technical guidelines for designing and operating the waste management system of an FSI facility equipped to burn coal. Waste transfer, storage, pretreatment/conditioning, transport, and disposal are addressed. These guidelines are based on current FSI waste management practices and associated operating problems as well as critical waste properties (e.g., chemical constituents, gradation, density, moisture content, flowability, strength, leachate properties, etc.). Consequently, the report briefly describes the waste management practices of six existing or planned utility installations and two industrial facilities using bituminous coal as their primary fuel source. Results of waste property tests conducted as part of this study, and test data from other studies are reported and compared. Conceptual designs of retrofit FSI waste management systems are presented to demonstrate the economic impact of FSI on waste management. Parametric cost sensitivity analyses illustrate the impact of significant design parameters on waste management costs. 136 refs., 93 figs., 58 tabs.

35960 (EPRI-GS–6438) **Trace metal removal by iron coprecipitation: Field evaluation: Final report.** Manzione, M.A.; Merrill, D.T. Electric Power Research Inst., Palo Alto, CA (USA); Brown and Caldwell, Pleasant Hill, CA (USA). c Jun 1989. 379p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Many trace elements found in coal-fired power plant wastewaters are designated as priority pollutants by the USEPA. These include beryllium, cadmium, copper, chromium, lead, nickel, and zinc. This report presents the results of a field demonstration of the iron adsorption/coprecipitation process at the Pennsylvania Power and Light (PP and L) Company's Montour Steam Electric Station in Washingtonville, Pennsylvania. The study focused on removing many of the above-mentioned trace elements from several waste streams, including ash pond effluent, air heater wash, coal pile drainage, and leachate from a dry fly ash landfill. The study's objectives were to verify previously derived laboratory results, confirm technological and economical feasibility, and develop information that could be used to design and estimate costs of full-scale systems. The treatment technology was tested at pilot scale (10 gpm) in a continuous system under field conditions. The study examined the roles of pH, iron, and polymers in trace element removal. Investigators also studied sludges produced by the treatment process. This report describes methods for predicting sludge production, gravity sludge thickening efficiency, and sludge dewatering effectiveness (by filter press). It also discusses the results of testing four different types of process sludge with five hazardous waste characterization procedures (the EP Toxicity, Toxicity Characteristic Leaching Procedure, and California Assessment Manual tests). Results are presented from experiments designed to simulate the interactions between iron sludges and clay liners when the sludges are buried in sludge-only landfills. Finally, a design and cost example is presented to illustrate the use of pilot results in implementation of iron treatment technology at full-scale. 59 refs., 37 figs., 65 tabs.

35961 (ORNL/TM–11197) **Characterization of fiber-reinforced particulate filters.** Stinton, D.P.; Riester, L.; Dellinger, D. Oak Ridge National Lab., TN (USA). May 1989. 41p. Sponsored by DOE Fossil Energy. DOE Contract AC05-84OR21400. Order Number DE89013762/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Fiber-reinforced particulate filters for high-temperature application were fabricated by a recently developed chemical vapor deposition process. Mechanical property testing of these filters revealed that fibrous materials required coating with 2 to 5 μm of silicon carbide to produce acceptable strengths and thermal shock resistance. Thinner coatings were very weak and resulted in unacceptable flexing of the filters. Thicker coatings were very strong but resulted in brittle fracture of the filters. Appropriately coated filters had both an acceptable strength and the improved damage tolerance required of particulate filters. Thermal shock and repeated pressure cycling representative of pressure pulse cleaning had no apparent effect on the burst strength of filter specimens. 19 refs., 14 figs., 1 tab.

35962 (TVA/OP/EDT–88/35) **10-MW spray dryer/ESP pilot plant test program: High-sulfur coal test phase (phase 3): Final report.** Tennessee Valley Authority, Chattanooga, TN (USA). Div. of Energy Demonstrations and Technology. Jul 1988. 329p. Sponsored by Tennessee Valley Authority. Order Number DE89014210/JAW. Available from NTIS, PC A15/MF A01 - OSTI.

The Tennessee Valley Authority, in cooperation with the Electric Power Research Institute and Ontario Hydro, evaluated a 10-MW spray dryer/electrostatic precipitator (SD/ESP) on flue gas derived from the burning of high-sulfur (approximately 4 percent) coal. The main objective of the testing was to determine the effect of the major variables on SO_2 removal efficiency and whether the spray dryer could be retrofitted before an existing ESP to meet SO_2 and particulate emission limits. Major variables affecting SO_2 removal are the approach-to-saturation temperature, lime stoichiometry, and spray dryer inlet flue gas temperature. In addition, some preliminary screening tests with an alternate lime, an alternate higher chloride coal, and a different feed system design were run. These screening tests seemed to show enhanced SO_2 removal for these alternatives, which will be evaluated further. Carbon steel and Cor-Ten A are adequate materials of construction for this facility provided necessary precautions are made to avoid air in leakage which could allow cold spots, resulting in condensation and increased corrosion. Sufficient insulation on metal surfaces is also necessary. 62 figs., 30 tabs.

35963 (TVA/PG/RD–88/40) **High-sulfur spray dryer Shawnee test program: Characterization of 10-MW spray-dryer electrostatic precipitator by-product: Final report.** McKee, J.E.; Ray, S.S. Tennessee Valley Authority, Chattanooga, TN (USA). Power Business Operations/Research and Development. Aug 1988. 67p. Order Number DE89014512/JAW. Available from NTIS, PC A04/MF A01 - OSTI.

As part of Phase III MW spray drying/electrostatic precipitator (SD/ESP) pilot plant testing, a study was undertaken to characterize the recycle waste in terms of chemical, engineering and environmental properties. Results of this study are presented herein. Since the pilot plant test plan involved evaluation of the SD/ESP over long-term baseline and diverse modes of operation, an additional objective was statistical correlation of recycle waste characteristics with operating conditions. This would allow waste characteristics to be predicted as a function of operating conditions. 4 refs., 24 figs., 7 tabs.

35964 (ZE–601G569) **Review of environmental monitoring equipment for air, water and soil systems. Vol. 2(iii)-Equipment data sheets. Record #529-586, user and utility information records.** Zenon Environmental, Inc., Burlington, ON (Canada).

1989. 259p. (CE–02615). Available from Canadian Electrical Association, Research & Development, Suite #500, One Westmount Square, Montreal, PQ, Canada H3Z 2P9; $75.00 NON-MEMBERS; MEMBERS: PRICES UPON REQUEST, FUNDS CAN.

The objectives of this study were to review the state-of-the-art of environmental monitoring equipment suitable for the utility industry, to prepare an equipment database and to identify areas where further research is needed. A review of instrumentation for air, water, and soil monitoring applications was carried out based on a survey of manufacturers and suppliers. Hard copies of equipment data sheets for data handling equipment, generated from the survey of manufacturers and suppliers and of users' experience, comprise the first part of this volume. Next listed are data sheets of 163 pollution monitoring installations in utility plants across Canada, giving equipment information and performance data. Finally, data sheets of 38 utility plants across Canada list basic plant information and environmental parameters monitored.

35965 (ZE–601G569) **Review of environmental monitoring equipment for air, water and soil systems. Vol 2(II)-Equipment data sheets. Record #247-528.** Zenon Environmental, Inc., Burlington, ON (Canada). 1989. 282p. (CE–02614). Available from Canadian Electrical Association, Research & Development, Suite #500, One Westmount Square, Montreal, PQ, Canada H3Z 2P9; $75.00 NON-MEMBERS; MEMBERS: PRICES UPON REQUEST, FUNDS CAN.

The objectives of this study were to review the state-of-the-art of environmental monitoring equipment suitable for the utility industry, to prepare an equipment database and to identify areas where further research is needed. A review of instrumentation for air, water, and soil monitoring applications was carried out based on a survey of manufacturers and suppliers. Hard copies of equipment data sheets generated from the survey of manufacturers and suppliers and of users experience comprise this volume, which covers measuring equipment (air-ambient, air-source, meteorological, soil, water).

35966 (ZE–601G569) **Review of environmental monitoring equipment for air water and soil systems. Vol. 2-Environmental monitoring equipment database.** Zenon Environmental, Inc., Burlington, ON (Canada). 1989. 340p. (CE–02613). Available from Canadian Electrical Association, Research & Development, Suite #500, One Westmount Square, Montreal, PQ, Canada H3Z 2P9; $75.00 NON-MEMBERS; MEMBERS: PRICES UPON REQUEST, FUNDS CAN.

The objectives of this study were to review the state-of-the-art of environmental monitoring equipment suitable for the utility industry, to prepare an equipment database and to identify areas where further research is needed. A review of instrumentation for air, water, and soil monitoring applications was carried out, based on a survey of manufacturers and suppliers. This volume first presents the Environmental Monitoring Equipment Database. The dBase III database management system was used to store the information and also to provide limited access to the information through a program employing a menu system. Instructions on the use of the database are given. Hard copies of equipment data sheets generated from the survey of manufacturers and suppliers and of users experience comprise the rest of this volume. These data sheets are presented as follows: sampling equipment (air-ambient, air-source, soil-including solid waste-and water); and measuring equipment (air-ambient, air-source, meteorological, soil, water). Indexes of equipment suppliers, manufacturers, equipment type, and parameters measured are also included. This volume covers database records 1-246. 11 tabs.

35967 (ZE–601G569) **Review of environmental monitoring equipment for air, water and soil systems. Vol. 1 - Instrument review.** Zenon Environmental, Inc., Burlington, ON (Canada). 1989. 300p. (CE–02612). Available from Canadian Electrical Association, Research & Development, Suite #500, One Westmount Square, Montreal, PQ, Canada H3Z 2P9; $75.00 NON-MENBERS; MEMBERS: PRICES UPON REQUEST, FUNDS CAN.

The objectives of this study were to review the state-of-the-art of environmental monitoring equipment suitable for the utility industry, to prepare an equipment database and to identify areas where further research is needed. A review of instrumentation for air, water, and soil monitoring applications was carried out, based on a survey of manufacturers and suppliers. Airborne emissions contribute the heaviest load to the environmental impact from a generating station, and, as a result, have received the greatest attention. A variety of instrumentation and monitoring equipment is available for meteorological, ambient and source monitoring purposes. Continued use of on-line monitoring equipment is practiced for the key parameters, and new developments are constantly being evaluated to improve process reliability and sensitivity. Water monitoring instrumentation has received less interest; however, new regulations may initiate additional developments in on-line instrumentation. Emphasis is directed towards the development of suitable sampling procedures and protocols to facilitate the collection of representative samples during longer-term monitoring programs. Aside from groundwater and soil atmosphere monitoring, on-line analysis of soil or solid waste is not yet technically and economically feasible. Specific research needs for each matrix and each parameter are presented and assessed. 201 refs.

35968 (BCHPA–117-D-311) **Water treeing as a function of moisture present in XLPE cable insulation.** Abdollal, K. British Columbia Hydro and Power Authority, Surrey, BC (Canada). 1987. 49p. (CE–02632). Available from Canadian Electrical Association, Research & Development, Suite #500, One Westmount Square, Montreal, PQ, Canada H3Z 2P9; $75.00 NON-MEMBERS; MEMBERS: PRICES UPON REQUEST, FUNDS CAN.

Metal/polyethylene laminates (metal/PE) moisture barriers are now being used to reduce the harmful effects of water treeing in solid dielectric cables. However, the metal/PE barriers are not quite hermetic. Over a period of 10 years of operating the cable in a wet environment, a certain amount of moisture will diffuse through the barrier seal. The purpose of this project was to develop a test for the performance evaluation of cross-linked polyethylene (XLPE) cables with metal/PE barriers in the presence of these small amounts of moisture. The test program was carried out on 15 kV dry cured XLPE insulated cable having an Aluminum/polyethylene laminate moisture barrier. The rate of moisture uptake was measured for the cable components and a procedure was developed for introducing known amounts of moisture into cable samples with sealed termination. A one year aging test (at 26.3 kV, 60 Hz, room temperature) was performed on a total of 30 samples containing different amounts of moisture. This was followed by ac breakdown and water tree counts. The results of the study show that small amounts of moisture (105 g/km) introduced into a cable with a moisture barrier does not result in water tree growth and has no significant effect on the electrical performance of the cable. In contrast, cables saturated with water undergo a significant degradation due to water treeing. Based on the results of this study it is concluded that metal/PE barriers can be very effective in reducing the ingress of moisture in the cable and virtually eliminating the harmful effects of water trees. 15 refs., 14 figs., 4 tabs.

35969 (DOE/RA/50153–3) **Study of electric field and ion effects of HVDC [high voltage direct current] transmission lines: Characterization of the electrical environment beyond the corridor: Final report.** General Electric Co., Lenox, MA (USA). High Voltage Transmission Research Center. May 1989. 336p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC02-80RA50153. Order Number DE89014786/JAW. Available from NTIS, PC A15/MF A01 - OSTI; GPO Dep.

The Department of Energy, Division of Electric Energy Systems, initiated a research program in 1977 at the High Voltage Transmission Research Center to study the electrical environment associated with high voltage direct current (HVDC) overhead power transmission lines. The work described in this report was performed at the High Voltage Transmission Research Center (HVTRC) in Lenox, Massachusetts, during the period 1984–1988, using test facilities and instrumentation developed on behalf of the Department of Energy during the present phase of this research and during the previous phase of the research. 213 figs., 22 tabs.

35970 (IREQ–137-D-374) **Cyclic loading for distribution cables in duct banks, Vol. 4.** Bedard, N.; Raymond, R. Institut de Recherche d'Hydro-Quebec, Varennes, PQ (Canada). 1987. 54p. (CE–02629). Available from Canadian Electrical Association, Research & Development, Suite #500, One Westmount Square, Montreal, PQ, Canada H3Z 2P9; $75.00 NON-MEMBERS; MEMBERS: PRICES UPON REQUEST, FUNDS CAN.

This report presents the results of experimental and theoretical investigations involving the development and testing of a computer program for cable thermal calculations. An existing distribution duct bank was equipped and reinstrumented to conduct the necessary measurements on a full-scale cable installation. Another experimental installation was built to conduct tests on direct-buried cable. A laboratory mockup consisting of a 2-m single-duct installation was also built to verify the heat-flux distribution pattern around the cable-retaining duct obtained by theoretical development. The experimental results in the direct-buried and duct bank installations as well as the accurate heat flux distribution around the inside surface of the cable-retaining duct were used to create and test a comprehensive set of programs for current-carrying capacity calculations. 2 refs., 30 figs., 2 tabs.

35971 (IREQ–180-D-442) **Power line fault probabilities.** Desrochers, G.; Audette, L.; Blanchard, M.; Gagnon, C.; Proulx, R. Institut de Recherche d'Hydro-Quebec, Varennes, PQ (Canada). 1986. 157p. (CE–02637). Available from Canadian Electrical Association, Research & Development, Suite #500, One Westmount Square, Montreal, PQ, Canada H3Z 2P9; $75.00 NON-MEMBERS; MEMBERS: PRICES UPON REQUEST, FUNDS CAN.

Protection of communication equipment located close to electrical power systems is currently designed on a worse case basis. A methodology for risk quantification based on the probability of fault-current magnitudes at any point in the system would allow the design of less costlysystems. This project developed a methodology for computing this probability function. The function was implemented in a computer program, the Power Line Fault Probability Program. The program was tested against a typical distribution feeder. The capability of the program to tackle large systems was demonstrated by an analysis of Hydro-Quebec's high-voltage transmission system. 9 refs., 26 figs., 15 tabs.

35972 (IREQ–261-T-508) **Effect of oil viscosity on transformer loading capability at ambient temperatures below 0^0C.** Langhame, Y.; Aubin, J. Institut de Recherche d'Hydro-Quebec, Varennes, PQ (Canada). 1986. 35p. (CE–02628). Available from Canadian Electrical Association, Research & Development, Suite #500, One Westmount Square, Montreal, PQ, Canada H3Z 2P9; $75.00 NON-MEMBERS; MEMBERS: PRICES UPON REQUEST, FUNDS CAN.

When a transformer is operated under overload conditions, the limiting factor is usually the temperature of the hottest spot in the winding. Loading guides such as American National Standards Institute (ANSI) C57.92 provide the operator with a set of tables indicating the acceptable load factor as a function of a predetermined loss of 0^0C because they do not take accoutn of variations in oil viscosity and winding resistance. The thermal model proposed in this study allows the transient or steady-state hot-spot temperature to be calculated for any combination of load factor and ambient temperature down to -40^0C. The thermal model is applied to a typical transformer as defind in ANSI C57.92 and the calculated hot-spot temperatures compared to those yielded by the ANSI model. As the ambient temperature drops toward -40^0C, a clear divergence can be seen in the comparative results. This comes as no surprise, since the effect of oil viscosity was expected to have a strong influence at such low temperatures. However the results confirm that, for transformer with natural oil circulation, the ANSI model can be used down to -20^0C without any special modification to take account of oil-viscosity variations. 6 refs., 13 fig., 4 tabs.

35973 (MU/CRT–591) **A planning model for electrical power distribution grids.** Benchakroun, A. Montreal Univ., PQ (Canada). Centre de Recherche sur les Transports. 1988. 175p. (In French). (MICROLOG–89-00132). Available from Centre de recherche sur les transports, Universite de Montreal, CP 6128, Succursale A, Montreal, PQ, Canada H3C 3J7; $N/C.

In this thesis, the problem of the planning of electrical energy distribution was considered. A detailed mathematical model was devised, representing the fundamental characteristics of a radial power distribution grid. The costs of setting up and maintaining the equipment, as well as the costs due to power losses on-line were incorporated into the model. Contrary to existing models, this model introduces the concept of the utilization of a connector at a given time instead of the usual concept of the construction of a connector at a given time. The result is a non-linear programming problem involving continuous and discontinuous variables. Theorems were demonstrated which lead to a wholly linear problem, equivalent to the non-linear one. It was demonstrated that this new problem satisfied all the conditions required for applying the generalized Benders method. This method requires a workable initial solution; a way to extend the initial grid so as to obtain a good workable solution was proposed, and other constructive approaches were also mentioned. A flow problem at minimal cost, with a constraint of radiality, was encountered, for which 2 methods of resolution were provided. The problem was split into a sub-problem and a master problem. The resolution of the sub-problem was shown to be commonplace; the master problem was solved using the 200/XMP software. The applications of this research work were discussed. 41 refs., 13 figs., 18 tabs.

35974 (OH/RD–205-D-406) **TV interference study on distribution test line.** Reichman, J.; Hatanaka, G. Ontario Hydro Research Div., Toronto, ON (Canada). 1987. 108p. (CE–02626). Available from Canadian Electrical Association, Research & Development, Suite #500, One Westmount Square, Montreal, PQ, Canada H3Z 2P9; $75.00 NON-MEMBERS; MEMBERS: PRICES UPON REQUEST, FUNDS CAN.

The two main objectives of this project were to investigate the television interference (TVI) characteristics of various types of noise sources and to verify the validity of a new proposed TVI measurement method (Canadian Electrical Association 102-D-201), using a cross section of real power line noise sources such as gap, insulator, and corona. A majority of the tests for the first objective were carried out on a specially built TV and galloping test line, whereas the video tapes used for recording examples of TVI in the second part of the study were prepared in the laboratory using gap and insulator TVI. It was concluded that gap discharges from loose pole hardware are by far the strongest TVI source on wood-pole power lines and that they produce about 20-40 db more TVI than noisy and defective insulators. Regarding the signal-to-noise ratio measurements for picture quality evaluation, it was found that two relatively simple TVI measurement methods are the best parameters to be used because the much more sophisticated noise amplitude distribution overlay method proposed in CEA 102-D-201 did not outperform these simple methods. 12 refs., 60 figs., 16 tabs.

35975 (SAND–88-2932) **On the limitation of the weak-coupling assumption for crosstalk analysis in an inhomogeneous medium.** Riley, D.J.; Bacon, L.D. Sandia National Labs., Albuquerque, NM (USA). Mar 1989. 43p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE89014576/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The limitation of the weak-coupling assumption for the case of two transmission lines with a common ground in an inhomogeneous medium is carefully examined in this paper. All loss is neglected and the lines are assumed to be symmetric. The analysis is based on the mathematical structure of solutions to the telegrapher's equations, and therefore quasi–TEM propagation is assumed. A relationship is found between the propagation constants associated with both the fully coupled and the weakly coupled forms of these equations which leads to a necessary condition for the validity of weak-coupling in an inhomogeneous medium. Although satisfying this condition does not prove that the lines will be weakly coupled, it is anticipated that it will be the limiting factor for many applications of general interest, such as the crosstalk of digital signals on circuit boards. Theoretical and experimental results are given in both the frequency and time domains for several stripline geometries. Closed-form solutions to the telegrapher's equations based on weak-coupling in an inhomogeneous medium are provided. 11 refs., 10 figs.

35976 (IAEA-TECDOC–480, pp. 33-38) **Micro-computer fault tree program as a tool for defining problems.** Wild, A. (Atomic Energy Control Board, Ottawa, Ontario (Canada)). International Atomic Energy Agency, Vienna (Austria). Oct 1988. (CONF-8703320–: Technical committee meeting on the use of probabilistic safety assessment on personal computers for operational safety management, Vienna, Austria, 16-20 Mar 1987). In *Improving operational safety management through probabilistic safety assessment on personal computers. Report of a technical committee meeting held in Vienna, 16-20 March 1987.* Order Number DE89617155/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Numerical results from fault tree analyses are important, but the information on the logic of system failures is often even more important. It is also known that a major source of errors is an improper understanding of the factors affecting the performance and reliability of a system, and therefore fault tree analyses should be reviewed not only by experts in probabilistic techniques, but also by specialists in other related fields, such as nucleonics. Of paramount importance is also comparison of the fault tree logic with actual operating experience. Because fault trees are generally large, retrieval of information requires a suitable computer tool which should also allow some speculative analyses ("what-if-.."). A great problem in fault tree analysis is identification of cross-links. Cross-links are often missed if a fault tree becomes too big to handle and it is prematurely truncated so that cross-links due to support systems are overlooked. Or, the event coding scheme is not sufficiently defined and it is not recognized that the same factor appears on several locations of a fault tree. Use of a computer tool with extensive search and scan capabilities increases the chances for proper identification of cross-links. A suitable computer tool also reduces errors in coding of events as coding an input of fault tree data does not need to be considered a separate task, but becomes a part of the fault tree development. Also, during the design of the fault tree the analyst can directly review and restructure the tree so a better insight can be obtained in the ways a system can fail. TREE-MASTER is an example of a Fault Tree handling system for personal microcomputers which performs the tasks mentioned above. It can be used in a simple way, or a sophisticated way, depending on the needs and the experience of the user. (Abstract Truncated)

35977 (IAEA-TECDOC–480, pp. 39-52) **Use of the RELVEC code in nuclear power plant operational safety management.** Jaervinen, J. (Technical Research Centre of Finland, Espoo (Finland). Electrical Engineering Lab.); Pulkkinen, U.; Niemelae, I. International Atomic Energy Agency, Vienna (Austria). Oct 1988. (CONF-8703320–: Technical committee meeting on the use of probabilistic safety assessment on personal computers for operational safety management, Vienna, Austria, 16-20 Mar 1987). In *Improving operational safety management through probabilistic safety assessment on personal computers. Report of a technical committee meeting held in Vienna, 16-20 March 1987.* Order Number DE89617155/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

The utilization of the results and information contained in the Probabilistic Safety Analysis-models (PSA) and the results of PSA analysis in nuclear power plant safety management has become an actual problem after the completion of several PSA analyses. PSA-models include a huge amount of exhaustive information on the plants' technical systems and the designed response against the incidences at plant and system level. Traditionally this information has been used only to a minor extent in future analysis of plant safety. More or less this information has been used in daily management of nuclear power plant safety. Continuous development of reliability analysis tools has allowed use of the plant models in microcomputers in an efficient way. This paper describes the properties and advantages of the RELVEC reliability analysis code in risk assessment and especially in operational safety management. RELVEC has been developed in the Technical Research Centre of Finland (VTT) during 1980-1985. The code is available on IBM-PC and compatible microcomputers and also in VAX and CYBER computers. Reliability calculations with RELVEC are based on boolean algebra and minimal cut set technique. The special properties of RELVEC are related to the component dependency options. The dependency analysis option and its applications is described and its properties are demonstrated. The dependency option is especially suitable in maintenance and repair policy assessments and it can be used in various ways in external event analysis and as a tool for finding dependencies between systems and components. The flexible properties of RELVEC in safety related technical specifications assessment are also discussed. For example conditional failure probabilities given the unavailability of one or more redundant trains can be analysed using the flexible model editing facility of RELVEC. (Abstract Truncated)

35978 (IAEA-TECDOC–480, pp. 53-74) **Requirements and methods for a computer based information system on safety parameters and PSA for operational NPP safety management.** Balfanz, H.P. (Technischer Ueberwachungs-Verein Norddeutschland e.V., Hamburg (Germany, F.R.)); Becker, G. International Atomic Energy Agency, Vienna (Austria). Oct 1988. (CONF-8703320–: Technical committee meeting on the use of probabilistic safety assessment on personal computers for operational safety management, Vienna, Austria, 16-20 Mar 1987). In *Improving operational safety management through probabilistic safety assessment on personal computers. Report of a technical committee meeting held in Vienna, 16-20 March 1987.* Order Number DE89617155/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Based on a high level of probabilistic safety analyses of safety features prepared during licensing procedures of modern German NPP's it is intended to build a computer based information system on PSA as well as on safety parameters for NPP safety management purposes. The objectives of this information system are: A fast information system on all safety relevant features of systems and components supported by PSA methods to assess plant modifications, maintenance and test procedures; A management tool to assess the actual safety plant state due to abnormal events, e.g. safety component failures. For this purpose the system contains a data bank incorporating: safety relevant system and component data, system flow charts, fault trees, event trees, reliability data. The management tasks of this system are: processing and displaying of selected system and component data as requested by the user (plant managers) e.g. of components of actual interest; a graphic presentation of selected flow charts, fault and event trees as requested; a computer program for requantifying modified fault trees. For plant management and easy understanding purpose, information on probabilistic analyses will be illustrated as near to the actual system structure of the plant concerned as possible. Moreover, and for matters of understanding safety system performance and its importance, the requirements and assumptions of analyses as well as input and output data will be shown. The illustrations of event trees are being provided to show the structure of system functions and fault trees due to abnormal events and accident sequences. The information system can be used for qualitative and quantitative information. Furthermore this system permits updating if required, in accordance with the actual plant situation and experience by modifying the input data of adding new information into the data bank. 35979 (IAEA-TECDOC–480, pp. 75-82) **Practical use of personal computer based methods for NPP operational safety assessment.** Hollo, E. (Villamosenergiaipari Kutato Intezet, Budapest (Hungary)). International Atomic Energy Agency, Vienna (Austria). Oct 1988. (CONF-8703320–: Technical committee meeting on the use of probabilistic safety assessment on personal computers for operational safety management, Vienna, Austria, 16-20 Mar 1987). In *Improving operational safety management through probabilistic safety assessment on personal computers. Report of a technical committee meeting held in Vienna, 16-20 March 1987.* Order Number DE89617155/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Level-I PSA of PAKS Nuclear Power Plant with the aim of enhancing its operational safety was initiated in Hungary in 1985. Within this work a probabilistic model of the plant related to different initiating events and operational assumptions is being set up and analyzed according to basic PSA procedures. Initially main frame computer codes were used for both qualitative and quantitative analysis. Presently effort is being made to transfer well-proved

generic codes into IBM PCs and, simultaneously, to develop specific ones for personal computers. As a result, a mixed (main frame and PC) code set is recently being used for PSA purposes. The paper presents a summary of the used software methodology with special emphasis on input/output considerations of different codes. State-of-the-art of the PC package development for fault tree analysis and generic data management is given. Case studies for demonstration of practical applications with lessons learned and addressing problem areas are discussed. (author). 7 refs, 1 fig.

35980 (IAEA-TECDOC–480, pp. 83-94) **SALP-PC - A fault tree code on personal computer for plant safety assessment.** Contini, S. (Commission of the European Communities, Ispra (Italy). Joint Research Centre); Poucet, A. International Atomic Energy Agency, Vienna (Austria). Oct 1988. (CONF-8703320–: Technical committee meeting on the use of probabilistic safety assessment on personal computers for operational safety management, Vienna, Austria, 16-20 Mar 1987). In *Improving operational safety management through probabilistic safety assessment on personal computers. Report of a technical committee meeting held in Vienna, 16-20 March 1987.* Order Number DE89617155/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

The interactive program package SALP-PC for fault tree analysis, developed on an Olivetti M24 personal computer (IBM compatible), is written in Fortran-77 to guarantee the maximum portability. It is composed of five processors, implementing the different phases of the fault tree analysis procedure. Allowed logical operators are AND, OR, NOT, K/N, XOR and INH. Boundary conditions can also be defined to obtain fault trees conditioned to the state of one or more components. The possibility to define incompatible events is also allowed. An extensive check on input data is performed. At each step of the analysis the user can restart, with modified input parameters, without having to repeat the previous steps. The minimal cut sets (MCSs) are obtained by reducing the tree according to the bottom-up technique. To save computer time the approach of determining only the most significant MCSs has been adopted, which implies the assessment of an estimate of the contribution of the non significant MCSs to the system failure. Other methods have been implemented to reduce both computer time and memory space as, for instance, the modularization and the application of the minimization procedure only when strictly necessary. This paper contains the description of the main characteristics of the program, the analysis procedure on which it is based and the developments being carried out. (author). 2 refs, 3 figs, 1 tab.

35981 (IAEA-TECDOC–480, pp. 95-99) **CYRO - A fault tree analysis code for personal computers.** Armas, A. (Optiplant S.A., Madrid (Spain)). International Atomic Energy Agency, Vienna (Austria). Oct 1988. (CONF-8703320–: Technical committee meeting on the use of probabilistic safety assessment on personal computers for operational safety management, Vienna, Austria, 16-20 Mar 1987). In *Improving operational safety management through probabilistic safety assessment on personal computers. Report of a technical committee meeting held in Vienna, 16-20 March 1987.* Order Number DE89617155/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

CYRO is a fault tree analysis programme specifically designed for use on Personal Computers (PC's). The programme handles explicitly the set of Boolean equations corresponding to a fault tree and determines the equivalent Boolean expression in terms of minimal cutsets or prime implicants. The programme contains also a simple probability calculation model. This model can be used for probability truncation of low probability cutsets and for the assessment of the failure probability of the system considered with the fault tree. (author). 1 ref, 1 fig, 3 tabs.

35982 (IAEA-TECDOC–480, pp. 101-120) **RELTREE - A PC program for fault tree construction, documentation and analysis.** Berg, U. (Relcon AB, Sundbyberg (Sweden)). International Atomic Energy Agency, Vienna (Austria). Oct 1988. (CONF-8703320–: Technical committee meeting on the use of probabilistic safety assessment on personal computers for operational safety management, Vienna, Austria, 16-20 Mar 1987). In *Improving operational safety management through probabilistic safety assessment on personal computers. Report of a technical committee meeting held in Vienna, 16-20 March 1987.* Order Number DE89617155/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

RELTREE is a computer code for fault tree construction, documentation and analysis which has been developed for use on IBM- or IBM-compatible personal computers. The code includes an interactive graphic fault tree construction module, an editor for input of reliability data bases, and an analysis module. The analysis module can determine minimal cut sets, calculate top event unavailability, time-dependent reliability characteristics for the top event, and basic event importance, RELTREE also includes printer and plotter routines for documentation of fault trees, data bases and analysis results. The program is completely menu-driven and is easy to use. The capacity and performance of RELTREE is sufficient to solve large and complex fault trees, and comparisons show that it can be faster and more powerful than some recognized main-frame codes. Experience from the use of RELTREE has shown that considerable savings can be made both in man-hours and in computer run-time costs when compared with the use of more traditional main-frame codes. (author). 5 refs, 6 figs, 3 tabs.

35983 (IAEA-TECDOC–480, pp. 121-135) **PRISIM - A computer program that enhances operational safety.** Fussell, J.B. (JBF Associates, Knoxville, TN (USA)). International Atomic Energy Agency, Vienna (Austria). Oct 1988. (CONF-8703320–: Technical committee meeting on the use of probabilistic safety assessment on personal computers for operational safety management, Vienna, Austria, 16-20 Mar 1987). In *Improving operational safety management through probabilistic safety assessment on personal computers. Report of a technical committee meeting held in Vienna, 16-20 March 1987.* Order Number DE89617155/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

PRISIM, a Personal Computer program for translating PSA information for those who are not PSA experts is described. PRISIM is presently in use at the Arkansas Nuclear Unit One and at the Peach Bottom nuclear power plants with the purpose of aiding operational safety management. (author). 18 figs, 1 tab.

35984 (NUREG–0020-Vol.13-No.5) **Licensed operating reactors status summary report, data as of April 30, 1989.** Nuclear Regulatory Commission, Washington, DC (USA). Office of Information Resources Management. Jun 1989. 513p. Sponsored by Nuclear Regulatory Commission. Available from NTIS, PC A22/MF A01 - GPO - OSTI.

The US Nuclear Regulatory Commission's monthly LICENSED OPERATING REACTORS Status Summary Report provides data on the operation of nuclear units as timely and accurately as possible. This information is collected by the Office of Information Resources Management, from the Headquarters Staff of NRC's Office of Inspection and Enforcement, from NRC's Regional Offices, and from utilities. Since all of the data concerning operation of the units is provided by the utility operators less than two weeks after the end of the month, necessary corrections to published information are shown on the the ERRATA page. This report is divided into three sections: the first contains monthly highlights and statistics for commercial operating units, and errata from previously reported data; the second is a compilation of detailed information on each unit, provided by NRC Regional Offices, IE Headquarters and the Utilities; and the third section is an appendix for miscellaneous information such as spent fuel storage capability, reactor years of experience and non-power reactors in the United States.

35985 (CONF-890470– III.B.1.1-III.B.1.10) **Team skills training: the critical next step at GPU Nuclear.** Coe, R.P. (General Public Utilities Nuclear Corp., Middletown, PA (USA)); Carl, D.R. Jr. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27

Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

Numerous reports and articles have been written recently on the importance of team skills training for nuclear reactor operators, but little has appeared on the practical application of this theoretical guidance. The Training and Education at GPU Nuclear (GPUN) has initiated a high level of activity and commitment to team skills training. In 1987, GPUN undertook a significant initiative in its licensed operator training programs to design and develop initial and requalification team skills training. Prior to that time, human interaction skills training (communication, stress management, supervisory skills, etc) focused more on the individual rather than a group. Today, GPU Nuclear conducts team training at both its Three Mile Island (TMI) and Oyster Creek (OC) generating stations. Videotaped feedback is used extensively to critique and reinforce targeted behaviors. In fact, the TMI simulator trainer has a built-in, four camera system specifically designed for team training. Evaluations conducted on this training indicated these newly acquired skills are being carried over to the work environment. Team training is now an important and on-going part of GPUN operator training.

35986 (CONF-890470– III.B.3.1-III.B.3.17) **Effective simulator training for BWR operating crews in Japan.** Noji, K.; Isono, T.; Saito, G.; Miyakita, K.; Toeda, S.; Kobayashi, A. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

The BWR Operator Training Center (BTC), established in 1971, has 2 full-scope simulators. (The third simulator is under construction and scheduled to go into use in October 1989.) These simulators are used to train all operators of BWR utilities in Japan. A high level of ability by shift crews as well as individuals is required in order to maintain the safe and reliable operation of a nuclear power plant. The team training for each shift crew, called Family Training, is conducted to upgrade team performance using the simulator. All operating crew members take part in Family Training which is a 1 day course, and each crew is trained 2 or 3 days a year. In this training, the shift supervisor submits a training plan based on the tasks laid out for his crew members, and the BTC instructors training technology contributes to the simulator exercises. Consequently, the training needs of the operating crew and BTC training know-how are fruitfully combined to achieve the most effective result. It is a good feature that BTC can conduct team training for each utility using effective methods, which are acquired and accumulated by BTC from many years of experience.

35987 (CONF-890470– V.A.4.1-V.A.4.12) **Use of statistics to monitor quality in training.** Helin, F.J. (Vermont Yankee Nuclear Power Operations, Rutland (USA)); Gardner, R.F. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

The present method of examining quality in nuclear training is primarily through the use of periodic audits, usually externally done. But, the authors can control and monitor the quality of their training programs at a much lower cost and with greater efficiency by using other methods. By initiating Statistical Quality Control (SQC) methods, the data from individual exams can be used to identify strengths/weaknesses in each exam item and in the exam as a whole as well as generic weaknesses in the knowledge level of the population being examined. As an example, a brief review of a regression analysis performed at Vermont Yankee is presented. This analysis was performed in order to examine how well their licensed operator training program actually prepared their license candidates for the NRC exam. In order for the results of such a statistical analysis to actually be useful, a commitment to act on these results must come from the highest level of management. This upper level of management must realize that quality is quantitative and that statistics is only a means to that end (of improving quality). Many companies have instituted slogans as a means of improving quality. Slogans do not increase quality; only an on-going commitment to constant improvement will.

35988 (CONF-890470– V.B.2.1-V.B.2.6) **Adult learning techniques in maintenance training.** Roush, K.M. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

The increased emphasis on the training of power plant personnel has provided the trainer with the resources and the opportunity to develop and implement quality training programs. Trainers must continually focus on how to present these quality programs in the most efficient and effective manner possible. Applied Adult Learning Techniques will increase the probability that training programs will be effective and efficient. Adult Learning Techniques used at Susquehanna power plant since 1978 are discussed.

35989 (EGG-M–88303) **Aging degradation of BWR feedwater and main steam lines.** Ware, A.G.; Shah, V.N.; Buescher, B.J. EG and G Idaho, Inc., Idaho Falls, ID (USA). 1989. 10p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC07-76ID01570. (CONF-890721–16: Joint ASME/JSME pressure vessel and piping conference, Honolulu, Hawaii, USA, 23-27 Jul 1989). Order Number DE89009646/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This paper assesses the stressors causing aging degradation, the degradation mechanisms, the potential failure modes, and the inservice inspection requirements for Boiling Water Reactor (BWR) feedwater and main steam lines. The principal mechanisms responsible for age-related degradation are fatigue and erosion-corrosion. Feedwater nozzles have experienced fatigue damage caused by thermal stratification, water hammers, and flow-induced vibration. The main steam piping at fittings and discontinuities is susceptible to erosion-corrosion damage. Feedwater lines have also been damaged by vibrations and water hammer events. General Electric Company (GE) tests have shown that the feedwater and main steam lines, which are made of carbon steel, may be more susceptible to fatigue damage in a BWR environment than predicted by the ASME fatigue curves based on specimens tested in air. BWR feedwater lines have experienced less erosion-corrosion than Pressurized Water Reactor (PWR) feedwater lines because they have a higher oxygen content. 38 refs., 4 figs., 2 tabs.

35990 (EGG-M–88448) **A review of recent developments in pipe damping allowable values for United States nuclear plants.** Ware, A.G. EG and G Idaho, Inc., Idaho Falls, ID (USA). 1989. 10p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC07-76ID01570. (CONF-890721–27: Joint ASME/JSME pressure vessel and piping conference, Honolulu, Hawaii, USA, 23-27 Jul 1989). Order Number DE89010980/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This paper reviews the history of allowable limits for damping in the analysis of nuclear piping since the issue of USNRC Regulatory Guide (RG) 1.61. In the early 1980s, it became clear that piping design had become too conservative, resulting in systems that had far too many supports, particularly snubbers. These supports were costly to design, install, and inspect; contributed to increased worker radiation exposure; and since snubbers sometimes failed to pass inservice inspection tests, the safety margin of the systems was reduced. A series of steps was undertaken by the PVRC to propose new damping limits, which culminated in an alternate damping allowable, called PVRC damping. This damping was later adopted as Code Case N-411 to the ASME Code. The ASME Appendix N Committee was not entirely satisfied with the PVRC recommendation. Consequently, EPRI sponsored a research project by Bechtel to review the damping data, perform a regression analysis, and recommend a permanent change to the ASME Code to replace Code Case N-411. The details of these activities are summarized in this paper. 20 refs., 13 figs., 1 tab.

35991 (EPRI-NP–6386) **Modeling hydrogen water chemistry for BWR applications: Final report.** Ruiz, C.P.; Lin, C.C.; Wong, T.L.; Robinson, R.N.; Law, R.J. Electric Power Research Inst., Palo Alto, CA (USA); General Electric Co., San Jose, CA (USA). Nuclear

Energy Div. c Jun 1989. 143p. Sponsored by Electric Power Research Institute. Available from Researach Reports Center, Box 50490, Palo Alto, CA 94300.

This report contains the results of calculated concentrations of O_2, H_2O_2 and H_2 and other hydrogen-oxygen species in various regions of the primary circuit for 9 BWRs for various concentrations of feedwater hydrogen. The calculations were performed by computer simulation using the GE-Harwell radiolysis model and compared with hydrogen water chemistry test data and results from a mass balance model. 36 refs., 57 figs., 9 tabs.

35992 (EPRI-NP–6394) **Feature-enhanced-imaging field trials: Peach Bottom Unit 3: Interim report, Phase 2.** Selby, G.; Williams, R.; Shankar, R. Electric Power Research Inst., Palo Alto, CA (USA); Jones (J.A.) Applied Research Co., Charlotte, NC (USA). c Jun 1989. 250p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Feature-based systems that combine imaging and signal analysis capabilities may be useful for nondestructive evaluation (NDE) of plant components. This report describes the field evaluation of an integrated system at a plant site during a scheduled outage for pipe weld examination to discriminate intergranular stress corrosion cracking (IGSCC) from benign, geometrical reflectors. The integrated system consisted of a personal computer (PC)-based system capable of detailed analysis of ultrasonic signal data and an in-service inspection (ISI) imaging system used in many commercial pipe examinations for IGSCC. The integrated system was trained to discriminate automatically IGSCC from other reflectors using EPRI NDE Center's inventory of field-removed samples. The methods and results of this training are described. Several classifiers were synthesized using mathematical features derived from signals that were collected to simulate field conditions. Data collection procedures were developed that required minimal operator training. Field data were collected and analyzed before and after pipe decontamination prior to pipe replacement. Automatic decision maps were generated for easier data interpretation and comparison. The field trial was conducted in October 1987–January 1988. Future activities will include collecting additional data after pipe removal to compare changes in baseline. These results will be presented in subsequent reports. 174 figs., 9 tabs.

35993 (JAERI-M–88-261) **Analysis of the CSNI/GREST core concrete interaction chemical thermodynamic benchmark exercise using the MPEC2 computer code.** Muramatsu, Ken; Kondo, Yasuhiko; Uchida, Masaaki; Soda, Kunihisa. Japan Atomic Energy Research Inst., Tokyo (Japan). Jan 1989. 58p. Order Number DE89790959/JAW. Available from NTIS (US Sales Only), PC A04/MF A01.

Fission product (EP) release during a core concrete interaction (CCI) is an important factor of the uncertainty associated with a source term estimation for an LWR severe accident. An analysis was made on the CCI Chemical Thermodynamic Benchmark Exercise organized by OECD/NEA/CSNI Group of Experts on Source Terms (GREST) for investigating the uncertainty in thermodynamic modeling for CCI. The benchmark exercise was to calculate the equilibrium FP vapor pressure for given system of temperature, pressure, and debris composition. The benchmark consisted of two parts, A and B. Part A was a simplified problem intended to test the numerical techniques. In part B, the participants were requested to use their own best estimate thermodynamic data base to examine the variability of the results due to the difference in thermodynamic data base. JAERI participated in this benchmark exercise with use of the MPEC2 code. Chemical thermodynamic data base needed for analysis of Part B was taken from the VENESA code. This report describes the computer code used, inputs to the code, and results from the calculation by JAERI. The present calculation indicates that the FP vapor pressure depends strongly on temperature and Oxygen potential in core debris and the pattern of dependency may be different for different FP elements.

35994 (ORNL/tr–89/31) **Boiling water reactor.** Yokobori, Seiichi. Oak Ridge National Lab., TN (USA). 1989. 10p. Translation of Japanese Patent Application No. 60-53878, March 27, 1985. Sponsored by DOE Nuclear Energy. DOE Contract AC05-84OR21400. Order Number DE89013796/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This document describes an invention which pertains to a boiling water reactor that is equipped with heat exchangers in the reactor pressure vessel for the purpose mainly of supplying heat.

35995 (STUDSVIK-NF-P–87-43) **Rod overpressure experiment (ROPE). Pre-project.** Schrire, D. Studsvik Nuclear, Nykoeping (Sweden). 23 Oct 1987. 31p. Order Number DE89617960/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

This project was undertaken to obtain both experimental data and experience with certain experimental techniques, which were considered necessary for the multilateral Rod Overpressure Experiment (ROPE Project). A BWR segment rod was refilled after base irradiation to give a rod internal pressure in excess of the system pressure. This rod and an identical (but not refilled) reference rod were irradiated in the R2 reactor. The overpressure rod had a clad outward creep of approximately 8 μm after 20 days irradiation at 30 kW/m, but with an overall reduction in the pellet-clad gap.

35996 (STUDSVIK-STSR–11) **Test fuel rod fabrication and pre-irradiation characterization report, rod groups PK1, PK2 and BK7: Studsvik Super-Ramp Project.** Lorz, E. (comp.). Studsvik Energiteknik AB, Nykoeping (Sweden); Kraftwerk Union A.G., Erlangen (Germany, F.R.). Hauptbereich Brennstoffkreislauf. 31 Mar 1981. 56p. Sponsored by DOE Nuclear Energy. DOE Contract FG06-80ET34032. Order Number DE89013236/JAW. Available from NTIS (US Sales Only), PC A04/MF A01 - OSTI; GPO Dep.

KWU/CE are supplying a total of 16 PWR and 8 BWR test fuel rods from the Studsvik SUPER-RAMP Project in the years 1980 and 1981. In addition to the eight PWR rods of groups PK4 and PK6 delivered in 1980, eight PWR rods divided into the groups PK1 and PK2, as well as eight BWR rods of rod group BK7 will be delivered to Studsvik in 1981. Supply of the PWR rods includes one additional spare rod for each group. The PK2 rods were fabricated and characterized during fabrication in the first half of the year 1976. The irradiation in the nuclear power plant Obrigheim (KWO) started in June 1976. In the following year, 1977, the PK1 rods were fabricated, characterized and inserted into the KWO core. The irradiation of both rod groups PK1 and PK2 was terminated by June 1980. The eight BWR test fuel rods which constitute the rod group BK7 were fabricated and characterized in 1974. The irradiation in the nuclear power plant Wuergassen (KWW) started in May 1975, and ended in December 1980. This report presents the data package on fabrication and characterization and manufacturing outline for the rod groups PK1, PK2 and BK7.

35997 (STUDSVIK-STSR–17) **Base irradiation history and interim inspection of the BWR test fuel rods of rod group BK7: The Studsvik Super-Ramp Project.** Jumlt uttner, A. Studsvik Energiteknik AB, Nykoeping (Sweden); Kraftwerk Union A.G., Erlangen (Germany, F.R.). Hauptbereich Brennstoffkreislauf. Feb 1982. 39p. Sponsored by DOE Nuclear Energy. DOE Contract FG06-80ET34032. Order Number DE89013242/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; GPO Dep.

Eight short BWR test fuel rods (rod group BK7) have been supplied by KWU for the Studsvik SUPER-RAMP Project. These fuel rods, assembled with six additional rods to two segmented rods of KWW standard length, were pre-irradiated in the nuclear power plant Wuergassen (Kernkraftwerk Wuergassen = KWW) Germany during four operation cycles from May 1975 to December 1980. After removal from the fuel assembly the rods were taken to the Hot Cells at Karlstein for interim inspection prior to the ramp tests at Studsvik. This report presents the detailed base irradiation history of the rods in KWW as well as the results of the interim inspection at Karlstein. 21 figs., 5 tabs.

35998 (STUDSVIK-STSR–19) **Fabrication, pre-irradiation characterization and irradiation history of GE rods, for The Super-Ramp Project: The Studsvik Super-Ramp Project.** Hendriksz, P.J.; Roden, M.E.; Rowland, T.C.; Yang, R.L. Studsvik Energiteknik AB, Nykoeping (Sweden); General Electric Co., Fairfield, CT (USA). Mar 1982. 75p. Sponsored by DOE Nuclear Energy. DOE Contract FG06-80ET34032. Order Number DE89013244/JAW. Available from NTIS (US Sales Only), PC A04/MF A01 - OSTI; GPO Dep.

The General Electric Company is supplying a total of eight (8) fuel rods for the Super Ramp Project. These eight fuel rods are from the segmented test rod (STR) assembly in the Monticello Boiling Water Reactor (BWR). Monticello is owned and operated by Northern States Power Co. Each of the segmented fuel rods in the 8 x 8 STR assembly was made up with four removable segments. The purpose of this report is to provide pre-irradiation, and irradiation history data for the eight GE segments. 4 figs., 9 tabs.

35999 (STUDSVIK-STSR–21) **The Studsvik Super-Ramp Project: Quarterly progress report, April–June, 1982.** Djurle, S. Studsvik Energiteknik AB, Nykoeping (Sweden). Aug 1982. 27p. Sponsored by DOE Nuclear Energy. DOE Contract FG06-80ET34032. Order Number DE89013246/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; GPO Dep.

This is the eighth Quarterly Progress Report distributed from the Studsvik Super-Ramp Project. It covers the second quarter of 1982. The scope of the technical program for the Super-Ramp Project is an experimental investigation of the pellet-clad interaction (PCI) performance under power ramp conditions for commercial type LWR test fuel rods irradiated to high burnup. The program incorporates rods of PWR standard as well as modified designs and rods of BWR standard design. 13 refs., 3 figs., 2 tabs.

36000 (STUDSVIK-STSR–24) **The Studsvik Super-Ramp Project: Quarterly progress report, July–September, 1982.** Djurle, S. Studsvik Energiteknik AB, Nykoeping (Sweden). Nov 1982. 26p. Sponsored by DOE Nuclear Energy. DOE Contract FG06-80ET34032. Order Number DE89013248/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; GPO Dep.

During this reporting period the Project work is behind the schedule with regard to power ramping and post-ramp examinations. In order to avoid interruptions of the power rampings, the R2 reactor system has been equipped with a more reliable safety valve device instead of an improperly functioning rupture disc system. This action has caused a delay for the remaining power rampings, thus no ramps have been performed during the third quarter. Post-ramp examinations at Studsvik have continued on the ramped W and GE rods. The main PIE work on the W rods has been completed. After transport in mid-July of all remaining KWU rods from Studsvik to Karlstein the post-ramp examinations have started at Karlstein. Minutes from the Fifth Project Committee Meeting in Sigtuna on June 10-11, 1982, have been issued as well as a status report on financial matters as of June 30, 1982 and the Eighth Quarterly Progress Report for the second quarter of 1982.

2102 Power Reactors, Non-breeding, Light-water Moderated, Non-boiling Water Cooled

36001 (CEGB-RD/L–3306/R88) **Proposals for improving interphase drag modelling for the bubbly and slug regimes in RELAP5.** Putney, J.M. Central Electricity Research Labs., Leatherhead (UK). Jun 1988. 95p. (PWR/HTWG/P–88-597). Order Number DE89618366/JAW. Available from NTIS (US Sales Only), PC A05/MF A01 - OSTI; INIS.

The proposal is put forward that the effective interphase drag coefficient for the bubbly and slug regimes in RELAP5 should be calculated using best-estimate void fraction correlations. It is argued that this will lead to improvements in the code's modelling of interphase drag and evidence is given to corroborate this. The need for such improvements has been prompted by the poor performance of the current models in simulating rod bundle experiments. There is also concern that the models do not account for profile slip effects, which could be important in a variety of geometries, and that the slug flow equations may not be appropriate for large diameter vertical pipes. To support the proposal, a set of void fraction correlations is identified which is believed to cover the full range of geometries and flow conditions encountered in PWR safety analysis including the analysis of small-scale experimental facilities. This set is selected from a detailed appraisal of the most appropriate correlations found in the literature which takes account of comparisons with experimental data and physical considerations. This Report forms part of the UK's commitment to the ICAP Code Improvement Plan. The recommendations will now be implemented in a development version of RELAP5/MOD3 and a preliminary assessment made. The interphase drag models used in the annular-mist regime will also be examined and, if necessary, appropriate improvements will be proposed.

36002 (CONF-890470– II.A.4.5-II.A.4.11) **Expectations for training.** Zach, J.J. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

At Point Beach Nuclear Plant, management tries to address training expectations to satisfy the various classes of customers that the Training Group has. For example, one group of customers would include the students. They may feel satisfied if the material they are presented is understandable, applicable to their jobs, and made interesting. Another customer would include senior management. They may be satisfied if the training program results in high marks from the Institute of Nuclear Power Operations and/or the Nuclear Regulatory Commission and is implemented in a very cost-effective manner. Another class of customers is the regulators and the evaluators. They may be satisfied if the training program is regimented, documented, and structured. Finally, there is the last group of people concerned, the plant management. They will be satisfied if all the other customers are satisfied, particularly those who happen to be exerting the most pressure on them at any given time.

36003 (CONF-890470– II.B.4.1-II.B.4.6) **Managing the training function.** Wiggin, N.A. (Public Safety of New Hampshire (USA)). Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

At Seabrook Station, New Hampshire Yankee has instituted the concept of a Training Advisory Council and Curriculum Advisory Committees. These two bodies (the former with fixed membership, and the latter with changing membership) are part of every phase of the Training System Development process. The Council is made up of senior management personnel, or their authorized designees, to review all training programs, including making recommendations about what is required and what is optional training. The Curriculum Advisory Committees are made up of representatives of the departments for which training is developed and implemented. These committees begin with the validation of the lists, the selection of items for training, the training settings and the initial approval of all phases of the development process. They review the design, the development, and the evaluative instruments on all the training programs. They recommend to the Council the acceptance of newly developed programs, and as necessary, the deletion or discontinuation of any program. Because they are made up of plant personnel, the process provides for the active involvement of the customer in determining training needs, directing the content, approving the objectives, and evaluating the effectiveness of the training. This paper describes how these committees were developed, how the necessary commitment was obtained and a description of one program as it passed through the process.

36004 (CONF-890470– V.B.4.1-V.B.4.22) **Evolution of technician and maintenance training.** Clifton, D.R. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

In the past five years Maintenance Training at Diablo Canyon Power Plant has evolved into a sophisticated and strongly supported organization. The key elements in the successful transition have been management support and plant specific hands-on training equipment.

36005 (CONF-890470– VI.A.3.1-VI.A.3.11) **SRO supervisory skills.** Holt, J.W. (Florida Power and Light Co., Miami (USA)). Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

Over the past 4 years, St. Lucie Nuclear Plant has had 64 unplanned shutdowns of which 35 were automatic trips. Eight of these 35 automatic trips were associated with operator error. Analysis has shown that the three top causes of operator error were poor communication, poor supervisory practice, and imposed stress. Operations Training at St. Lucie has developed a countermeasure that addresses these causes and provides the supervisory skills necessary for the senior reactor operator (SRO) to be the hub of an operations crew. These skills not only apply when all operations are normal but also apply when off-normal and emergency events are in progress. St. Lucie Operations Training Department developed an approach that integrates Questioning, Intervention, Observation, and Coaching into a task called QIOC. This task is based upon an understanding of human information processing theory and represents the core of SRO supervisory skills. A classroom setting is used to describe the task and the theory upon which it is built. After being taught the theory behind QIOC, the students see practical application of its use. Through the media of video the students see control room crews in a variety of situations, from surveillance testing to emergency operations. They view the SRO's proper use of the QIOC task. The final phase of SRO Supervisory Skills training is done on the Simulator. The student practices the individual skills of QIOC through the use of Simulator Exercise Guides.

36006 (CONF-890721–23) **Impact of an apparent radiation embrittlement rate on the life expectancy of PWR [pressurized-water-reactor] vessel supports.** Cheverton, R.D.; Pennell, W.E.; Robinson, G.C.; Nanstad, R.K. Oak Ridge National Lab., TN (USA). 1989. 9p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC05-84OR21400. From Joint ASME/JSME pressure vessel and piping conference; Honolulu, Hawaii, USA; 23-27 Jul 1989. Order Number DE89010258/JAW. Available from NTIS, PC A02/MF A01 - OSTI.

Recent data from the HFIR vessel surveillance program indicate a substantial radiation embrittlement rate effect at low irradiation temperatures (~120°F) for A212-B, A350-LF3, A105-II and corresponding welds. PWR vessel supports are fabricated of similar materials and are subjected to the same low temperatures and fast neutron fluxes ($10^8 - 10^9$ n/cm^2-s, E > 1.0 MeV) as those in the HFIR vessel. Thus, the embrittlement rate of these structures may be greater than previously anticipated. A study sponsored by the NRC is under way at ORNL to determine the impact of the rate effect on PWR vessel support life expectancy. The scope includes the interpretation and application of the HFIR data, a survey of all LWR vessel support designs, and a structural and fracture-mechanics analysis of the supports for two specific PWR plants of particular interest with regard to a potential for support failure as a result of propagation of flaws. Calculations performed for one of the plants indicate best-estimate critical flaw size corresponding to 32 EFPY, of ~0.4 in. It appears that low-cycle fatigue is not a viable mechanism for creation of flaws of this size. Thus, presumably such flaws would have to exist at the time of fabrication. 19 refs., 8 figs., 3 tabs.

36007 (EPRI-NP–6410) **The plant expert system (PLEXSYS) development environment: System description and user's manual, version 2: Final report.** Hashemi, S.; Patterson, L.; Jeffery, M.; Delashmutt, L. Electric Power Research Inst., Palo Alto, CA (USA); Intellicorp, Mountain View, CA (USA). c Jun 1989. 146p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The PLEXSYS software engineering tool provides an environment with which utility engineers can build and use expert systems for power plant applications. PLEXSYS provides the engineer with access to many powerful Artificial Intelligence methodologies, while retaining an engineering frame of reference and minimizing the need for a formal background in computer science. The principle concept is that the description and understanding of power plant systems centers on graphical forms such as piping and instrumentation diagrams and electrical line diagrams, which define a graphics-based model of plant knowledge that is common to many applications. PLEXSYS provides a model editor that allows the user to construct and modify models of hydraulic, electrical, and information systems in terms of elementary components and their interconnections. Analysis of the resulting schematic models is provided by several functions that perform network analysis, schematic browsing, mathematical modeling and customization of the user interface. 41 figs., 1 tab.

36008 (INIS-SU–76, pp. 16-20) **Stratification of coolant non-isothermal turbulent flows in power plant components.** Opanasenko, A.N.; Selivanov, V.M. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Scientific-technical collection.* Order Number DE89012164/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 1.

Using experimental models of separate components of various-type nuclear power plants, invetsigations of temperature conditions and structure of non-isothermal coolant flow under stationary and dynamic operational modes are carried out. It is ascertained that at Fr <or approx. 1 in mixing chambers, collectors, pipelines, ring gap of a tank-type reactor the coolant temperature stratification takes place, producing considerable effect on thermohydraulic characteristics of the facility. 2 refs.; 6 figs.

36009 (INIS-SU–85, pp. 54-56) **HOST optimization program complex for management of the WWER internal fuel cycle.** Simonov, V.D.; Pavlov, V.I.; Perminov, A.A.; Pechikin, V.A.; Yuskov, A.M. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Nuclear reactor physics and technology. Scientific-technical collection.* Order Number DE89012154/JAW. Available from NTIS (US Sales Only), PC A05/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 2.

It is presented the HOST code complex for optimal management and prospect planning of the WWER in-core nuclear fuel cycle. The code complex allows to define assemblies for discharge, to evaluate the optimal number and enrichment of fresh fuel assemblies and to find the optimal allocation of each fuel assembly in the core by assuming a fixed properties of fuel assemblies of the previous reactor cycle and time of the next reactor cycle. The optimal decision for one cycle or a sequence of a number of equilibrium or nonequilibrium cycles may be determined. 5 refs.

36010 (JAERI-M–89-004) **Critical heat flux (CHF) characteristics of high conversion pressurized water reactor with double flat core.** Iwamura, Takamichi; Sugimoto, Jun; Okubo, Tsutomu; Murao, Yoshio. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1989. 150p. (In Japanese). Order Number DE89790901/JAW. Available from NTIS (US Sales Only), PC A07/MF A01.

Thermal-hydraulic feasibility of a high conversion pressurized water reactor (HCPWR) with a double flat core was studied from a view point of minimum departure from nucleate boiling ratio (MDNBR). The proposed HCPWR improves uranium utilization under the same electrical output as a conventional 3-loop PWR. The critical heat flux (CHF) data of Bettis Atomic Power Laboratory were used to evaluate the predictive capability of KfK, EPRI-B and W and EPRI-Columbia correlations for triangular tight lattice cores. Among them, considering a predictive erroe band of 20%, the KfK correlation had the most promising features for a design purpose. The KfK correlation was applied to COBRA-IV-I steady-state subchannel analysis of the double-flat-core HCPWR under the same boundary conditions as the 3-loop PWR. As a result, it was revealed that the MDNBR of a reference design (fuel rod diameter: 9.5mm, control rod thimble diameter: 11.0mm and rod pitch: 11.4mm) satisfied the lower limit of MDNBR for a current PWR with a sufficient margin. Parametric studies clarified that: (1) The DNBR was increased with increasing the rod pitch or decreasing the control rod thimble diameter. (2) The radial peaking factor was recommended to be less than 1.72 under

the present reference core disign. (3) A smaller fuel rod diameter required a larger pitch-to-diameter ratio (p/d) to satisfy the lower limit of MDNBR. Based on the steady-state MDNBR analysis results, the feasibility of the double-flat-core HCPWR was proved under proper considerations of core design and radial power distribution.

36011 (NUREG/CR–5350) **Mission survey for the Pressure Vessel Research User's Facility (PVRUF).** Pennell, W.E.; Pugh, C.E. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Engineering; Oak Ridge National Lab., TN (USA). Jun 1989. 67p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC05-84OR21400. (ORNL/TM–11133). Available from NTIS, PC A04/MF A01 - GPO - OSTI.

Description is given of a mission survey conducted as an exploratory phase of the ORNL Pressure Vessel Research Users' Facility (PVRUF) program. PVRUF is a planned open access research facility with a broad capability to perform R and D tasks necessary to bring laboratory scale PWR pressure vessel technology advances to a production status. The unique capability of PVRUF to perform this function, for a wide range of emerging pressure vessel technology advances, derives from its use of a full-scale production PWR reactor vessel as the facility test article. A full-scale prototype test article, while essential to the PVRUF mission, introduces a particular need for rigor in the facility mission definition, and the associated selection of facility features and systems. The scale of the test article dictates a matching scale in the facility features and systems. Each addition of a facility or system can thus add a significant increment to the facility mission and cost. The goal is to define the facility mission as accurately as possible at this time and to reflect the dominant reactor pressure vessel R and D needs as defined by a segment of the commercial nuclear power community. The features and systems selected for inclusion in the facility conceptual design must be closely matched to the facility mission in order to achieve a cost-effective facility design. 17 refs., 13 figs., 4 tabs.

36012 (ORNL/tr–89/28) **Reinforced confinement in a nuclear reactor.** Norman, H. Oak Ridge National Lab., TN (USA). 26 Oct 1988. 11p. Translation of Swedish Patent Application No. 8404861-0, September 28, 1984. Sponsored by DOE Nuclear Energy. DOE Contract AC05-84OR21400. Order Number DE89012414/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The present invention concerns a nuclear reactor containing a reactor core, a swimming pool space that is filled and pressurized with a neutron-absorbing solution, a reactor tank, at least one heat exchanger, at least one inlet line, at least one return line and at least one circulation pump, where the said reactor tank is confined in the said swimming pool space and designed to be cooled with the aid of relatively pure water, which is fed by means of the said at least one circulating pump to the said reactor tank from the said heat exchanger via the said at least one inlet line and is returned to the heat exchanger via the said at least one return line. The problem that is to be solved by the invention is to design a reactor of the above type in such a way that a complete confinement of the primary circuit of the reactor is achieved at relatively low extra cost. This problem is solved by providing the reactor with a special confinement space that confines the heat exchanger, but not the reactor tank, with the confinement space and the swimming pool space being fashioned in the same concrete body.

36013 (STUDSVIK-STSR–12) **Base irradiation history and interim inspection of the KWU/CE test fuel rods of rod groups PK 1 and PK 2: The Studsvik Super-Ramp Project.** Lorz, E. Studsvik Energiteknik AB, Nykoeping (Sweden); Kraftwerk Union A.G., Erlangen (Germany, F.R.). Hauptbereich Brennstoffkreislauf. Sep 1981. 54p. Sponsored by DOE Nuclear Energy. DOE Contract FG06-80ET34032. Order Number DE89013237/JAW. Available from NTIS (US Sales Only), PC A04/MF A01 - OSTI; GPO Dep.

A total of 16 PWR type test fuel rods (segments) have been supplied by KWU/CE to the Studsvik SUPER-RAMP Project in the years 1980 and 1981. The first group delivered in 1980 consisted of eight rods of type PK 4 and PK 6. The second group is divided into 4 rods of type PK 1 and 4 rods of type PK 2 with one spare rod of each type. These rods have been supplied to Studsvik in 1981. The test fuel rods were assembled to segmented rods of standard length and pre-irradiated in the nuclear power plant Obrigheim (Kernkraftwerk Obrigheim = KWO) Germany from June 1976 (PK 2) and June 1977 (PK 1) respectively to June 1980. After removal from the fuel assembly the segmented rods were taken to the Hot Cells at Karlstein for disassembling and interim inspection prior to the ramp tests at Studsvik. This report presents the detailed pre-irradiation history of the PK 1 and PK 2 test fuel rods in KWO as well as the results of the interim inspection at Karlstein.

36014 (UCRL–100788) **A structural evaluation of the Shippingport reactor pressure vessel for transport impact conditions.** Witte, M.C.; Chou, C.K. Lawrence Livermore National Lab., CA (USA). 24 Mar 1989. 9p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-890721–19: Joint ASME/JSME pressure vessel and piping conference, Honolulu, Hawaii, USA, 23-27 Jul 1989). Order Number DE89009920/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The Shippingport Atomic Power Station in Shippingport, Pennsylvania, is being decommissioned and dismantled. This government-leased property will be returned, in a radiologically safe condition, to its owner. All radioactive material is being removed from the Shippingport Station and transported for burial to the DOE Hanford Reservation in Richland, Washington. The reactor pressure vessel (RPV) will be transported by barge to Hanford. This paper describes an evaluation of the structural response of the RPV to the normal and accident impact test conditions as required by the Code of Federal Regulations. 3 refs., 5 figs., 3 tabs.

36015 Development of HPLC techniques for the analysis of trace-metal species in the primary coolant of a pressurized-water reactor. Barron, K.R.P. Thesis (Ph. D.). 267p. Council for National Academic Awards, London, England (1988). Available from UMI, Dissertation Information Service, 300 North Zeeb Road, Ann Arbor, MI 48106.

BRDX-81,421.

The need to monitor corrosion products in the primary circuit of a pressurized water reactor (PWR), at a concentration of 10pg ml^{-1} is discussed. A review of trace and ultra-trace metal analysis, relevant to the specific requirements imposed by primary coolant chemistry, indicated that high-performance liquid chromatography (HPLC), coupled with preconcentration of sample was an ideal technique. A HPLC system was developed to determine trace metal species in simulated PWR primary coolant. In order to achieve the desired detection limit an on-line preconcentration system had to be developed. Separations were performed on Aminex A9 and Benson BC-X10 analytical columns. Detection was by post-column reaction with Eriochrome Black T and Calmagite Linear calibrations of 2.5-100ng of cobalt (the main species of interest), were achieved using up to 200ml samples. The detection limit for a 200ml sample was 10pg ml^{-1}. This study in conjunction with work carried out at Winfrith, resulted in a monitoring system that could follow changes in coolant chemistry, on deposition and release of metal species in simulated PWR water loops, On-line detection of cobalt at 11pg ml^{-1} was recorded.

36021 (JAERI-M–88-266) **Fission products plate-out analysis code in the HTGR: PLAIN.** Baba, Osamu; Tsuyuzaki, Noriyoshi; Sawa, Kazuhiro. Japan Atomic Energy Research Inst., Tokyo (Japan). Jan 1989. 64p. (In Japanese). Order Number DE89790896/JAW. Available from NTIS (US Sales Only), PC A04/MF A01.

Fission products plate-out analysis code in the HTGR, PLAIN, has been developed to calculate the plate-out distribution of high temperature gas cooled reactor. The code includes the following features: (1) The adsorption-desorption on the wall and the diffusion into the wall material are considered as a plate-out mechanism. (2) Mass transfer coefficient, adsorption rate, desorption rate, diffusion coefficient in the wall material and sublimation rate are calcualted in the code. (3) Numerical results are calculated by using Laplace inversion method. This report describes the analytical models, physical and chemical constants, numerical mehtod, users' manuals and the calculational results of experiments.

36022 (JAERI-M–88-267) **Study on the reaction between SIC and Pd, (2).** Namba, Takashi; Minato, Kazuo; Yamawaki, Michio; Fukuda, Kousaku. Japan Atomic Energy Research Inst., Tokyo (Japan). Jan 1989. 19p. (In Japanese). Order Number DE89790897/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

An out of pile experiment was performed on the corrosion of the SiC layer by fission product Pd in the Triso-coated fuel particles of high temperature gas-cooled reactor. In order to clarify the corrosion mechanism, influence of Pd activity on the corrosion was studied. Seven Au-Pd alloys with different Pd contents were prepared and simulated TRISO-coated particles were heated in the powder of the alloys at 1473 and 1573K. The Pd-SiC reaction zones were observed and analyzed by XMA. From the experimental results, the reaction rate was found to be dependent on Pd activity. The dependence of the reaction rate on temperature and time was also discussed.

36023 (JAERI-M–89-006) **Graphite structural design code for the High Temperature Engineering Test Reactor.** Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1989. 42p. (In Japanese). Order Number DE89790943/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The reactor internal structures of the High Temperature Engineering Test Reactor (HTTR) are made up of mainly graphite components. The characteristics of graphite are quite different in stress-strain behavior from metals, since the ductility of graphite is significantly less than metals. Therefore, the design codes provided for metal components can not be applied directly to graphite components. The graphite structural design code for the HTTR was drafted by JAERI and reviewed by specialists outside JAERI. The design code is established mainly on the basis of JAERI's research data and by reference to the fundamental concepts of the domestic design codes for metal components. In this design code, the graphite components are categorized into the core components and core support components and the stress limits are specified separately to meet the safety requirements to each. This report presents the graphite structural design code for the HTTR which is utlized for the present design of the HTTR.

36024 (Juel–2231) **Investigation and test results of the PNP steam reformer test bundle in the EVA-II-plant.** Niessen, H.F.; Bhattacharyya, A.T.; Busch, M.; Hesse, K.; Zentis, A. Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung. Aug 1988. 125p. (In German). Available from Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung.

For the development of a licensable steam reformer, arranged and operated in the primary circuit of a HTR process heat plant, a steam reformer bundle with 18 full scale tubes and a nominal power of 5 MJ/s was manufactured and successfully tested in the EVA II-plant at KFA-Juelich. With these tests under normal operation conditions and also under disturbances the thermal, process and mechanical design could be approved. The steam reformer test bundle was operated for a total time of 5200 h. During a test time of 3230 h the temperature in the helium inlet zone was in a temperature range above 900^0C. Temperature cycle experiments took additional 520 h, where the helium inlet temperature was cycled more than 100 times from 960^0C to 630^0C to 960^0C. The process parameters were varied in such a broad field, that most of today's foreseeable operation conditions of nuclear heated steam reformers are included. Within this range the test bundle fulfilled the expected data and the experimental results could be forecasted by computer simulation. The demounting of the bundle out of the steam reformer vessel was done without any difficulty. The optical impression of the bundle was very good and was confirmed by measurement. For more intensive inspection after operation and material tests the bundle will be disassembled.

Chalk River Nuclear Labs. 1985. 8p. Order Number DE89620211/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

Chalk River research and development.

Heavy water is used as a moderator and heat transport medium in CANDU reactors. It is a very expensive component of the reactor and any leaking or downgrading serves to increase the cost of electric power. Precise analytical measurements of the isotopic concentrations of water samples over the entire range of D_2O concentrations are therefore vital for keeping such leaking or downgrading to a minimum. On-line isotopic analyzers offer many advantages over manual sampling; timely protection against leaks to the environment, continuous rather than discrete data for process control, accurate accounting for heavy water inventory, reduction in staff workloads, operational convenience and cost saving. This article outlines Chalk River Nuclear Laboratories' combined endeavours with Barringer Research Limited to find a viable approach to on-line D_2O monitoring at CANDU power stations and heavy water plants. The development of heavy water monitors from their initial design, the Series 400 monitors, to their current one, the Series 4600, is traced.

36027 (CONF-890673–2) **Overview of the US program of controls for advanced reactors.** White, J.D.; Sackett, J.I.; Monson, R.; Lindsay, R.W.; Carroll, D.G. Oak Ridge National Lab., TN (USA). 1989. 31p. Sponsored by DOE Nuclear Energy. DOE Contract AC05-84OR21400. From IWGFR specialists meeting on advanced controls for fast reactors; Argonne, IL, USA; 20-22 Jun 1989. Order Number DE89014776/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

An automated control system can incorporate control goals and strategies, assessment of present and future plant status, diagnostic evaluation and maintenance planning, and signal and command validation. It has not been feasible to employ these capabilities in conventional hard-wired, analog, control systems. Recent advances in computer-based digital data acquisition systems, process controllers, fiber-optic signal transmission artificial intelligence tools and methods, and small inexpensive, fast, large-capacity computers—with both numeric and symbolic capabilities—have provided many of the necessary ingredients for developing large, practical automated control systems. Furthermore, recent reactor designs which provide strong passive responses to operational upsets or accidents afford good opportunities to apply these advances in control technology. This paper presents an overall US national perspective for advanced controls research and development. The goals of high reliability, low operating cost and simple operation are described. The staged approach from conceptualization through implementation is discussed. Then the paper describes the work being done by ORNL, ANL and GE. The relationship of this work to the US commercial industry is also discussed.

36028 (HEDL-TME–81-30) **Submerged gravel scrubber demonstration as a passive air cleaner for containment venting and purging with sodium aerosols—CSTF tests AC7–AC10.** Hilliard, R.K.; McCormack, J.D.; Postma, A.K. Hanford Engineering Development Lab., Richland, WA (USA). Nov 1981. 303p. Sponsored by DOE Nuclear Energy. DOE Contract AC06-76FF02170. Order Number DE82006332/JAW. Available from NTIS (US Sales Only), PC A14/MF A01 - OSTI; GPO Dep.

Four large-scale air cleaning tests (AC7–AC10) were performed in the Containment Systems Test Facility (CSTF) to demonstrate the performance of a Submerged Gravel Scrubber for cleaning the effluent gas from a vented and purged reactor containment vessel. The test article, comprised of a Submerged Gravel Scrubber (SGS) followed by a high efficiency fiber demister, had a design gas flow rate of 0.47 m^3/s (1000 ft^3/min) at a pressure drop of 9.0 kPa (36 in. H_2O). The test aerosol was sodium oxide, sodium hydroxide, or sodium carbonate generated in the 850-m^3 CSTF vessel by continuously spraying sodium into the air-filled vessel while adding steam or carbon dioxide. Approximately 4500 kg (10,000 lb) of sodium was sprayed over a total period of 100 h during the tests. The SGS/Demister system was shown to be highly efficient (removing ~99.98% of the entering sodium aerosol mass), had a high mass loading capacity, and operated in a passive manner, with no electrical requirement. Models for predicting aerosol capture, gas cooling, and pressure drop are developed and compared with experimental results.

36029 (HEDL-TME–83-12) **Submerged gravel scrubber demonstration tests: Performance of a large-scale unit.** McCormack, J.D.; Hilliard, R.K.; Postma, A.K. Hanford Engineering Development Lab., Richland, WA (USA). Dec 1984. 51p. Sponsored by DOE Nuclear Energy. DOE Contract AC06-76FF02170. Order Number DE89013138/JAW. Available from NTIS (US Sales Only), PC A04/MF A01 - OSTI; GPO Dep.

This report describes the performance of a scaled-up submerged gravel scrubber (SGS). This scrubber concept was invented by Westinghouse Hanford Company in 1978 and has been under development since that time. The SGS tested here had a design gas flow capacity of either 3.96 m^3/s (8400 cfm) or 5.65 m^3/s (12,000 cfm). These flow rates are roughly an order of magnitude larger than the design flow rate for an engineering-scale submerged gravel scrubber tested earlier. Hydraulic characteristics and aerosol trapping efficiencies were measured in a series of 12 tests. The scaled-up SGS performed as expected, based on test results from smaller-scale units. The test results confirmed the validity of the scaled-up design and verified that the SGS concept is a viable candidate for full-scale breeder reactor containment venting applications.

36032 (KFK–4491) **TEGENA: Detailed experimental investigations of temperature and velocity distributions in rod bundle geometries with turbulent sodium flow.** Moeller, R. Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorbauelemente; Kernforschungszentrum Karlsruhe G.m.b.H.

(Germany, F.R.). Projekt Schneller Brueter. Feb 1989. 190p. (In German). Order Number DE89788355/JAW. Available from NTIS (US Sales Only), PC A09/MF A01.

Precise knowledge of the velocity and temperature distributions is necessary in fuel element design (rod bundles with longitudinal flow). The detail codes required in the fine analysis of non-uniformly cooled bundle zones are presently at the stage of development. In order to verify these computer codes, the mean fluid temperatures and the related RMS values of the temperature fluctuations were measured in a heated bundle TEGENA, containing 4 rods arranged in one row (P/D = W/D = 1.147) with sodium cooling ($Pr \simeq 0.005$). The temperature distribution in the structures was determined as the necessary boundary condition for the temperature profiles in the fluid. The experiments were carried out with different types of heating (uniform load and load tilting) and the flow conditions were varied in the range from $4000 \leq Re \leq 76.000$, $20 \leq Pe \leq 400$. The essential process of thermal development took place under uniform load within a heated bundle length of about 100 hydraulic diameters. In the main measuring plane at the end of the heated zone, after 200 hydraulic diameters, the flow can be termed largely developed thermally. There, the temperature profiles measured in the fluid exhibit pronounced maxima in the narrowest gaps of the subchannels as well as pronounced minima in the centers of the subchannels at the unheated wall. In the zones of maximum temperature gradients the temperature fluctuations attain maximum and minimum values, respectively, at the points of disappearance of the temperature gradients. In all cases of load tilting investigated the flow at the end of the heated zone had not yet developed thermally. By inspection of all thermocouples in isothermal experiments performed at regular intervals, by redundant arrangement of the mobile probe thermocouples and by demonstration of the reproducibility of results of measurement the experiments have been validated satisfactorily.

36033 (KFK–4501) **Experimental study of the phenomena of turbulent flow in the narrow gaps between subchannels of rod bundles.** Moeller, S.V. Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik; Karlsruhe Univ. (T.H.) (Germany, F.R.). Fakultaet fuer Maschinenbau; Instituto de Engenharia Nuclear, Rio de Janeiro, RJ (Brazil). Jan 1989. 187p. (In German). Order Number DE89788354/JAW. Available from NTIS (US Sales Only), PC A09/MF A01.

It was observed that the turbulent intensities in the narrow gaps between the subchannels of rod bundles are strongly anisotropic and higher than in pipes. In rod bundles, both the axial and azimuthal components of the fluctuating velocity have a quasi-periodic behaviour. The intensities increase with decreasing distance between the rods or between rod and channel wall, respectively. To determine the origin of this phenomenon, experiments were performed in rod bundles with different pitch-to-diameter (P/D) and wall-to-diameter (W/D) ratios. In these experiments, two components of the fluctuating velocity were measured with hot wires simultaneously at two different locations of a wall subchannel, together with the pressure fluctuations at the wall measured by microphones. The output signals were registered with an analog tape recorder. Afterwards they were digitized and evaluated to obtain spectra as well as auto and cross correlations. The results were analysed to determine the interdependence between pressure and velocity fluctuations. Attention was devoted to the analysis of turbulence spectra and the identification of their specific ranges. The dominant frequency of the turbulent motion, taken from the spectra, was found to be a function of the gap width and of the flow velocity. The corresponding Strouhal number is a geometrical parameter which can be expressed in terms of P/D and W/D. Based on the observation of transit time between the probes, measured with help of cross correlations, on the form and the presence of peaks on spectra, a phenomenological model was developed, to explain the studied phenomenon. The model describes the formation of large eddies near the gaps and their effect on the fluid motion through rod bundles. The relationship between the mixing process and the studied phenomenon was determined.

36034 (WHC-SA–0205) **Fast Flux Test Facility passive safety reactivity feedback measurements.** Knutson, B.J.; Harris, R.A.; Nguyen, D.H.; Omberg, R.P. Westinghouse Hanford Co., Richland, WA (USA). Mar 1988. 9p. Sponsored by DOE Nuclear Energy. DOE Contract AC06-87RL10930. (CONF-880506–29: American Nuclear Society topical meeting on the safety of next generation power reactors, Seattle, WA, USA, 1-6 May 1988). Order Number DE89011857/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A series of experiments conducted in the Fast Flux Test Facility (FFTF) measured the reactivity change between approximately 200 reactor states. The test data have been evaluated to determine the thermal hydraulic parameters of the reactor at those states. Auxiliary measurements have been analyzed to convert the measured control rod position changes to reactivity and to correct for burnup effects. The data are now available for studies of the temperature reactivity feedbacks in liquid metal reactors. Preliminary comparisons with a feedback algorithm developed from normal FFTF operation indicate that the functional form of feedbacks can be extrapolated to offnormal conditions. 1 ref., 6 figs., 3 tabs.

36035 (WHC-SA–0412) **Thermo-plastic analysis of a bowed sodium pump shaft.** Weiner, E.O. Westinghouse Hanford Co., Richland, WA (USA). Mar 1989. 7p. Sponsored by DOE Nuclear Energy. DOE Contract AC06-87RL10930. (CONF-890721–13: Joint ASME/JSME pressure vessel and piping conference, Honolulu, Hawaii, USA, 23-27 Jul 1989). Order Number DE89008798/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A hollow sodium pump shaft was found to have a residual bow sufficient to cause unacceptable vibrations. Investigations suggested that the bow was caused by a sodium overfill event while the pump was shut down and the shaft was not turning. A rising sodium level with natural convection effects could result in local heating of the shaft. Even though the shaft may be essentially free, a local one-sided thermal loading may cause thermal stresses and plastic stains sufficient to give a residual bow when the thermal load is removed. A series of elastic-plastic analyses were carried out to assess the likelihood of the proposed mechanism's causing the residual bow. A special purpose computer program modelled the shaft as a Bernoulli beam. Isotropic hardening was evaluated by successive approximation. For each case studied, a loading sequence was followed by an assumed elastic unloading step, and the thermal loading zone was assumed small compared to the shaft length. These simplifying assumptions allowed parameterization of several variables–yield stress, thermal loading magnitude, extent of the heated zone around the shaft circumference, temperature distribution around the circumference, and shaft unrestrained/restrained conditions. Although the magnitude of the residual bow is not centered with the solution using mean parameters of this study, it is possible that a one-sided combination of parameter values did exist and that such a condition caused the bow under the proposed mechanism. 4 refs., 12 figs.

36036 (WHC-SA–0455) **FFTF metal fuel pin sodium bond quality verification.** Pitner, A.L.; Dittmer, J.O. Westinghouse Hanford Co., Richland, WA (USA). Dec 1988. 6p. Sponsored by DOE Nuclear Energy. DOE Contract AC06-87RL10930. (CONF-890604–5: Annual meeting of the American Nuclear Society, Atlanta, Georgia, USA, 4-8 Jun 1989). Order Number DE89013506/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The Fast Flux Test Facility (FFTF) Series III driver fuel design consists of U-10Zr fuel slugs contained in a ferritic alloy cladding. A liquid metal, sodium bond between the fuel and cladding is required to prevent unacceptable temperatures during operation. Excessive voiding or porosity in the sodium thermal bond could result in localized fuel melting during irradiation. It is therefore imperative that bond quality be verified during fabrication of these metal fuel pins prior to irradiation. This document discusses this verification.

36037 (WHC-SA–0498) **Evaluation of the advanced mixed oxide fuel test FO-2 irradiated in Fast Flux Test Facility.** Gilpin, L.L.; Baker, R.B.; Chastain, S.A. Westinghouse Hanford Co., Richland, WA (USA). May 1989. 25p. Sponsored by DOE Nuclear Energy. DOE Contract AC06-87RL10930. (CONF-890604–7: Annual meeting of the American Nuclear Society, Atlanta, Georgia, USA, 4-8 Jun 1989). Order Number DE89013528/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The advanced mixed-oxide (UO_2-PuO_2) test assembly, FO-2, irradiated in the Fast Flux Test Facility (FFTF), is undergoing postirradiation examination (PIE). This is one of the first FFTF tests examined that used the advanced ferrite-martensite alloy, HT9,

which is highly resistant to irradiation swelling. The FO-2 includes the first annular fueled pins irradiated in FFTF to undergo destructive examination. The FO-2 is a lead assembly for the ongoing FFTF Core Demonstration Experiment (CDE) (Leggett and Omberg 1987) and was designed to evaluate the effects of fuel design variables, such as pellet density, smeared density, and fuel form (annular or solid fuel), on advanced pin performance. The assembly contains a total of 169 fuel pins of twelve different types. The test was irradiated for 312 equivalent full power days (EFPD) in FFTF. It had a peak pin power of 13.7 kW/ft and reached a peak burnup of 65.2 MWd/kgM with a peak fast fluence of 9.9×10^{22} n/cm^2 (E > 0.1 MeV). This document discusses the test and its results. 6 refs., 19 figs., 4 tabs.

2106 Power Reactors, Auxiliary, Mobile, Package, and Transportable

36038 (JAERI-M–89-010) **Study on the optimization with shielding design of marine reactor.** Takeuchi, Kiyoshi; Itoh, Yasuyoshi; Yokomura, Takeyoshi. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1989. 26p. (In Japanese). Order Number DE89790946/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The primary shield should be optimized for the purpose of decreasing the radiation dose to personnel during reactor operation and also shut down. In general, the marine reactor should be designed as small as possible, which requires the minimization of the total space including the reactor and its primary shield. While for the secondary shield, its weight is overwhelmingly heavy and reaches a large percent of the total shield weight, which inevitably forces to minimize its weight. Thus, a proposal is presented for the shielding optimization with taking the respective aim described above for the primary and secondary shield into account. This proposal requires that the target dose-rate level should be set as 1/10 of the usual one behind the primary shield during reactor operation, and that the primary shield and also the shield for equipments should be designed to satisfy this new target level, resulting in that the aim of the secondary shield can be restricted to only the hypothetical accident. Consequently this proposal enables us to consider the shielding design separately for the primary and the secondary shields. On the basis of this idea, a consideration is made for decreasing the secondary shield weight by means of filling water within the container at the time of accidents, which suggests a reasonable means of decreasing the weight, although there remain still several considerations on how to filling water and the time for filling.

36039 (CONF-890470– III.A.1.1-III.A.1.22) **Simulation facility evaluation program.** Hunemuller, N.K. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

As a result of Section 306 of the Nuclear Waste Policy Act of 1982, the NRC developed a requirement for nuclear power plants licensed by the NRC to have a simulation facility appropriate for conducting operator licensing tests. Such simulation facilities would be required to be available by March, 1991. These requirements are included in the revised 10 CFR 55 effective May 1987. Other guidance is located in Reg. Guide 1.149, NUREG-1258 and ANS 3.5, 1985. The evaluation program requires that a plant-referenced simulator be certified to the NRC as meeting the guidance of ANS 3.5, 1985, or that a plan be submitted for a simulation facility using alternative methods to meet the requirements of conducting an operating test. In the case of certifications to ANS 3.5, 1985 the NRC may review these certifications and, if necessary, conduct on site inspections of the simulation facility. Plans for simulation facilities which are not in accordance with ANS 3.5 must be approved by the NRC. Once a facility has a certified or approved simulation facility and an accredited requalification program based on a systems approach to training, they would no longer be required to submit details of an operator licensing applicant's training, experience and education.

36040 (CONF-890470– III.A.3.1-III.A.3.19) **Three alternative simulation systems for training nuclear power plant personnel.** Roman, C.P.; Hine, R.C.; Yeh, S.D. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

Many utilities are purchasing full scope control room simulators for training purposes, but, depending upon training requirements and finances, an alternative to a full scope control room simulator may be a viable option. Westinghouse has built and delivered two styles of alternative simulation systems. Both of these systems provide real-time, plant specific simulation, and the capacity to execute all plant general, emergency, and most off-normal procedures. This paper discusses the design of both of these systems, including the design of a hybrid simulator, presently under construction, which combines features from both of these designs. In addition, some of the training capabilities and limitations for each of these simulations systems is presented.

36041 (CONF-890470– III.A.4.1-III.A.4.17) **Simulator instructor training - a case of utility teamwork.** Swander, A.J. (Virginia Electric and Power Co., Richmond (USA)). Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

To address the complex challenge of simulator instructor training, the training managers in the Southeastern States Nuclear Training Association assigned staff personnel representing each utility to develop initial simulator instructor training materials. The goal was to develop and pilot a simulator instructor training workshop that would: (1) be used by INPO for its initial simulator instructor training; and (2) would be available to all nuclear utilities. The development of training materials on how to use each utility's site-specific simulator was to be the responsibility of each utility. During the course of the year, beginning in March 1987, the team members worked through the process: table-top analysis of instructor skills; curriculum design of key lesson plans needed; the division of the topics for development among each group of participants; cross-company review of materials; editing; rewriting to establish continuity in approach; and finally, in August 1988, a pilot workshop. Nine utilities actively participated in the design and development of the materials. In preparing the abstract, a two-fold topic emerges: (1) the dynamics of the project working group; and (2) the actual finished product - the materials themselves.

36042 (CONF-890470– III.A.5.1-III.A.5.12) **New performance-based examination program for licensed reactor operators.** Cooley, R.A.; Guenther, S. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

Nuclear power plant operators licensed by the US Nuclear Regulatory Commission (NRC) are required to participate in continuing (requalification) training programs sponsored by their facility licensees. The NRC has developed a new performance-based examination methodology to evaluate the proficiency and currency of power plant operators and the effectiveness of the facilities programs. This examination methodology includes an operating test and a written examination, each involving two parts. The operating test allows the examiner to observe the operators actions during simulated accident scenarios and during a plant walk-through. The simulation facility demonstration is designed primarily to evaluate the performance of the combined control room crew, while the plant walk-through evaluates individual operators abilities to correctly perform tasks (Job Performance Measures (JPMs)) that are important to safety. The two-part written examination is conducted in a static simulator and in a classroom. Both parts are administered in an open reference format in which the operators have available to

them the same reference material that they would normally have available in the control room for use in operating the plant. This allows the operators to display their ability to monitor, predict and analyze operational data and to follow procedures for accidents that may exceed the design basis of the plant. This new examination program provides a more realistic operational setting than ever before. Trials of the program were highly successful and full-scale implementation is currently underway.

36043 (CONF-890470– III.A.5.13-II.A.5.19) **Industry activities on operator requalification.** Tipton, T.E. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

The Nuclear Regulatory Commission (NRC) developed a new performance-based exam program for operator requalification exams. Nuclear Management and Resources Council (NUMARC) has worked very closely with the NRC, Institute of Nuclear Power Operation, and the Regional Training Associations during the pilot phase of its development. Guidelines were developed and discussed at four co-sponsored workshops. Additionally, NUMARC sponsored a one-day industry meeting to discuss how utilities can organizationally plan methods of sharing work products to develop the operator requalification examination materials. NUMARC's Operator Issues Working Group has been directly involved in all phases of this issue. The revised requalification program was fully implemented in October 1988. NUMARC will continue to work closely with the NRC to facilitate a smooth transition into the revised process.

36044 (CONF-890470– III.B.2.1-III.B.2.11) **Lessons learned from three years of operator team skills training.** Harrington, D.K. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

It has become increasingly clear that team skills training is not just a training program, but rather an on-going learning process through which nuclear operators become increasingly aware of their behavior in a team and how that behavior either contributes to or detracts from the effectiveness of the team. As the operators continue in that process, they choose to make changes in their behavior that enhance their value to the team. This awareness does not always come easily, and it does not come from the trainer. The awareness comes as a result of the operators observing their own performance of videotape and from experiencing feedback from fellow team members, from knowledgeable facilitators, and from themselves. Team skills is currently in its infancy with many and varied possibilities for the future. While not fully supported today by the entire nuclear industry, the concept is beginning to gain wider recognition as a viable method for improving the performance of control room crews. However, for team skills to have its greatest impact in terms of plant reliability and safety, it must receive support and reinforcement from all levels of management. When the entire plant is operating as a team, everyone wins.

36045 (CONF-890470– III.B.4.1-III.B.4.10) **Frustration, the challenge and the victory of team building.** Brown, M.B. (Northeast Utilities, Springfield, MA (USA)). Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

Traditionally, Team Training has been an exercise in Team Talking. The nuclear industry has never really been known for its team efforts. The Nuclear Regulatory Commission talks about the individual and that person's individual responsibility. Licensing exams evaluate the individual and on a shift basis and not as a member of a larger team. Approximately 80% of the staff functions outside of the control room. Astronauts can only get into space if the team as a whole functions well. It should be noted that those teams train together in mock launches and simulated flight. In the nuclear industry, it is believed that if the control room trains as a team, somehow the remaining 80% of the staff will function as a precision clock. This approach has failed. The time is now to champion a new approach to Team Building based on innovation and creativity.

36046 (CONF-890470– V.A.5.1-V.A.5.19) **Feasibility of quantitative performance measures for evaluating nuclear power plant operators.** Carter, R.J.; Connelly, E.M.; Krois, P.A. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

A more valid measure of team performance in nuclear power plants is needed. A study is described which was oriented towards evaluating the feasibility of synthesizing performance measures by deriving measures for crews responding to an off-normal event in a full-scope simulator. The thesis was that performance assessment is based on the subjective judgment of training instructors. The procedure used to synthesize the performance measure consisted of: identification of the factors believed to be important to performance assessment, development of example crew performances and ratings on each be instructors, and derivation of the measure by capturing the instructors assessment rules. A performance measure was derived which explains nearly all of the variance of the instructors team performance assessments. There is reason to believe that this method of synthesizing measures can be applied to other events.

36047 (EPRI-NP–6295) **Guidelines for quality records in electronic media for nuclear facilities (NCIG-10): Final report.** Domenico, W.F.; Broadus, C.R. Electric Power Research Inst., Palo Alto, CA (USA); Vanguard Technologies, Inc., Ogden, UT (USA). c May 1989. 38p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

This document presents guidelines and supporting information for the creation, storage, retrieval, control and approval of quality records in electronic media for nuclear facilities. The guidelines were developed in response to a rapidly-growing trend toward the storage, maintenance and retrieval of such records on computer systems. They provide a consistent approach to the electronic creation, storage, retrieval, control and approval of quality records, a subject heretofore not addressed by industry standards and regulations. 11 refs., 1 fig.

36048 (NUREG–0750-Vol.29-No.3) **Nuclear Regulatory Commission issuances, March 1989.** Nuclear Regulatory Commission, Washington, DC (USA). Div. of Freedom of Information and Publications Services. Mar 1989. 142p. Sponsored by Nuclear Regulatory Commission. Available from NTIS, PC A07/MF A01 - GPO - OSTI.

This report includes the issuances received during the specified period from the Commission (CLI), the Atomic Safety and Licensing Appeal Boards (ALAB), the Atomic Safety and Licensing Boards (LBP), the Administrative Law Judge (ALJ), the Directors' Decisions (DD), and the Denials of Petitions for Rulemaking (DPRM).

36049 (NUREG–0750-Vol.29-No.4) **Nuclear Regulatory Commission issuances, April 1989.** Nuclear Regulatory Commission, Washington, DC (USA). Div. of Freedom of Information and Publications Services. Apr 1989. 56p. Sponsored by Nuclear Regulatory Commission. Available from NTIS, PC A04/MF A01 - GPO - OSTI.

This report includes the issuances received during the specified period from the Commission (CLI), the Atomic Safety and Licensing Appeal Boards (ALAB), the Atomic Safety and Licensing Boards (LBP), the Administrative Law Judge (ALJ), the Directors' Decisions (DD), and the Denials of Petitions for Rulemaking (DPRM).

36050 (NUREG–1331) **Technical Specifications, Seabrook Station, Unit 1 (Docket No. 50-443): Appendix "A" to License No. NPF-67.** Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation. May 1989. 413p. Sponsored by Nuclear Regulatory Commission. Available from NTIS, PC A18/MF A01 - GPO - OSTI.

The Seabrook Station, Unit 1 Technical Specifications were prepared by the US Nuclear Regulatory Commission to set forth the limits, operating conditions, and other requirements applicable to a

nuclear reactor facility as set forth in Section 50.36 of 10 CFR Part 50 for the protection of the health and safety of the public.

36051 (NUREG–1349) **Compilation of fastener testing data received in response to NRC Compliance Bulletin 87-02.** Cwalina, G.C.; Conway, J.T.; Parker, L.B. (comps.). Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation. Jun 1989. 104p. Sponsored by Nuclear Regulatory Commission. Available from NTIS, PC A06/MF A01 - GPO - OSTI.

On November 6, 1987, the Nuclear Regulatory Commission (NRC) issued Bulletin 87-02, "Fastener Testing to Determine Conformance With Applicable Material Specifications," to all holders of operating licenses or construction permits for nuclear power reactors (licensees). The bulletin was issued so that the NRC staff could gather data to determine whether counterfeit fasteners are a problem in the nuclear power industry. The bulletin requested nuclear power plant owners to determine whether fasteners obtained from suppliers and/or manufacturers for use in their facilities meet the mechanical and chemical specifications stipulated in the procurement documents. The licensees were requested to sample a minimum of 10 safety-related and 10 non-safety-related fasteners (studs, bolts, and/or cap screws) and a sample of typical nuts that would be used with each fastener and to report the testing results to the NRC. The results of this study did not indicate a safety concern relating to the use of mismarked or counterfeit fasteners in the nuclear industry, but they did indicate a nonconformance rate of 8 to 12 percent for fasteners. The NRC staff is considering taking action to improve the effectiveness of receipt inspection and testing programs for all materials at nuclear power plants.

36052 (NUREG–1354) **Fitness for duty in the nuclear power industry: Responses to public comments.** Bush, L.L.; Grimes, B.K. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Reactor Inspection and Safeguards. May 1989. 259p. Sponsored by Nuclear Regulatory Commission. Available from NTIS, PC A - GPO - OSTI.

The Nuclear Regulatory Commission published for public comment a proposed rule concerning the fitness for duty of commercial nuclear power plant workers (53 FR 36795). The proposed rule focused on methods for controlling the use of substances that may affect the trustworthiness and performance of workers. It provides for chemical testing, behavioral observation, employee awareness and education, and employee assistance programs as means for assuring fitness for duty. This report summarizes the comments received on the proposed rule and provides the staff resolutions of the issues raised by the comments. 3 refs.

36053 Organization of Risk Analysis Codes for Living Evaluations (ORACLE). Batt, D.L. (Idaho National Engineering Lab., Idaho Falls (USA)); MacDonald, P.E.; Sattison, M.B.; Vesely, E. v. of Probabilistic safety assessment and risk management PSA '87. Vol. 2. Verl. TUEV Rheinland, Koeln, Germany, F.R. (1987). DOE Contract AC07-76ID01570. (CONF-870820–: PSA 87: international topical meeting on probabilistic safety assessment and risk management, Zurich, Switzerland, 31 Aug - 4 sep 1987).

ORACLE (Organization of Risk Analysis Codes for Living Evaluations) is an integration concept for using risk-based information in United States Nuclear Regulatory Commission (USNRC) applications. Portions of ORACLE are being developed at the Idaho Nationale Engineering Laboratory for the USNRC. The ORACLE concept consists of related databases, software, user interfaces, processes, and quality control checks allowing a wide variety of regulatory problems and activities to be addressed using current, updated PRA information. The ORACLE concept provides for smooth transitions between one code and the next without pre- or post-processing.

36054 (CONF-890470– II.A.4.1-II.A.4.4) **Training: expectations of an operations superintendent.** Sellman, M.B. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

The end product of all nuclear power plant operator training, initial license, and requalification, has to be operators who are able to think through and understand what is required to perform their duties. The key is thinking, and the industry needs to focus on that in operator training during the 1990's. It will take a unified effort by the utilities, INPO, and the NRC, because utilities are forced to tune their training programs to address exam questions and also to attain INPO accreditation. A qualified operator is more than one who has been trained on all of the tasks listed in the Job and Task Analysis. A qualified operator is more than one good at trivial pursuit. A qualified operator is more than one who can follow cookbook Emergency Operating Procedures. A qualified operator is one who can think through and understand what is required to perform his/her duties.

36055 (CONF-890470– II.B.3.1-II.B.3.16) **Training management systems - a comparison.** Waylett, W.J. Jr. (Florida Power and Light Co., Miami (USA)). Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

The rapid growth of training programs in the nuclear utility industry over the past five years has challenged training management personnel to meet their customer's needs for effective training delivered when needed. Simultaneously, nuclear utility executives are concerned that the training process be cost-effective. The result of these forces has been the establishment of two training management systems: (1) a decentralized training management system that report to the site senior manager in order to stay close to customer needs; and (2) a centralized training management system that reports to a corporate training manager in order to be cost effective. This paper will compare the advantages and disadvantages of each training management system and will suggest methods for enhancing each system through the application of quality improvement principles.

36056 (CONF-890470– II.B.5.1-II.B.5.13) **Training management - lessons learned.** Newton, S.L. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

There has been a tremendous emphasis, rightfully so, on the incorporation of lessons learned into nuclear plant training programs for operators, technicians, and maintenance personnel. This paper will provide an opportunity to apply the lessons learned regarding training management based on observations of training organizations at over 40 plants. It will address those traits most commonly exhibited by strong training management and will provide examples of the practical application of those traits. The focus of the paper will be on the training manager and the actions he or she can take to lead an effective training organization. The premise will be developed that, in fact, the effective training manager must be more leader than manager.

36057 (CONF-890470– III.B.6.1-III.B.6.6) **Team maintenance as a result of team training.** Stone, S.K.; Lavender, D.R.; McAnulty, P.C. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

Nuclear station maintenance crews have long confronted complex jobs and adverse conditions. Crews often consist of diverse station and vendor personnel who may never have worked together as a team. They are given highly technical tasks that are further complicated by radiological controls, interfacing station groups, and shift turnovers. These complications, combined with the requirements of high quality and job execution standards, tend to result in extended down-time, increased radiation exposures and considerable stress on maintenance crews. A task involving these complications is the replacement of reactor coolant pump (RCP) seals. The advantages

of reactor coolant pump seal team training are noted as follows: (1) improves job performance and reduces time required to execute seal replace; (2) improves maintenance team cooperation and minimizes inter-personnel conflicts; (3) improves interfacing group relationships and defines responsibilities; (4) improves communication and minimizes non-productive time during shift turnovers; (5) validates procedures; and (6) identifies special tooling.

36058 (CONF-890470– IV.A.3.1-IV.A.3.8) **Performance based training for quality surveillance personnel.** Edelman, G.M. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

Quality surveillance in real-time is a growing industry trend to improve nuclear plant performance. However, training to support this function currently is not structured as systematically as tasking addressed through the INPO-coordinated accreditation program. This paper describes an effort by the ASQC Operations Quality Surveillance Subcommittee to produce a Quality Surveillance Handbook. The handbook will include recommendations for training content based in part on an industry-wide job analysis for the position being conducted by the subcommittee. This paper also describes a methodology for implementing a performance-based, quality surveillance program. The plan by design involves personnel who will be subject to surveillances as well as personnel who will conduct the surveillance. Design that includes both groups is the key to reducing conflict and promoting a consensus approach. Additionally, personnel must have a common process for defining weaknesses/problems and for determining corrective action.

36059 (CONF-890470– IV.A.4.1-IV.A.4.17) **Application of quality principles to training of QA audit personnel.** Glasser, W.J.; Espy, J. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

One of the major demands on nuclear QA audit programs today is their ability to determine and address the effectiveness of the activity being audited. Management wants to know with certainty whether an activity is effective or what must be done to make it effective. This demand stems largely from past experience where highly significant quality problems occurred with little, if any, forewarning by audit results. In many cases, audit results made no attempt to address effectiveness. Concurrently, a similar demand has been placed on training to teach auditors how to determine the effectiveness of an activity. This paper consists of two parts. Part 1 compares an auditor training program, developed in accordance with INPO's Training System Development methodology, with typical auditor training programs considered as satisfying ANSI N45.2.23 requirements. This comparison highlights the need to develop analytical techniques in addition to cognitive knowledge if auditing for effectiveness is to be taught. Part 2 identifies challenges encountered in implementing a skills-oriented training program for QA audit personnel and describes possible approaches for meeting these challenges. Both parts of this paper highlight those fundamental quality principles that should be ingrained into the auditor training program in order to address analytical techniques.

36060 (CONF-890470– IV.A.6.1-IV.A.6.10) **ASQC support of the quality profession in the utility industry - is it sufficient?.** Markowski, R.S. (GPU Nuclear Corp., Parsippany, NJ (USA)). Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

A professional society provides a process and a forum to provide for the recognition, nurturing and maintenance of a profession. Periodically, the professional society should evaluate whether it is providing these supportive roles to the profession as intended. About two years ago, the Education and Training Committee of the Energy Division of the American Society of Quality Control (ASQC) was reactivated. A process for characterizing the certification and/or training support that ASQC should provide to the quality profession in the utility industry is being addressed through a systematic self evaluation. The analysis phase of the Training System Design process is currently being conducted by the Education and Training Committee to formulate the body of knowledge associated with the quality engineering function in the utility industry. Once formulated that body of knowledge will be compared to that represented by the ASQC Quality Engineer and Reliability Engineer Certification Programs. That comparison should provide for a determination of the sufficiency of the ASQC certification and training support of the utility industry or suggest performance based improvements.

36061 (CONF-890470– V.A.2.1-V.A.2.24) **Managing instructor training to achieve excellence.** Norton, R.E. (Ohio State Univ., Columbus (USA)); Williams, T.M. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

The requirements for instructor training in the nuclear electric power industry are clearly set forth in the August 1988 INPO 88-012, Guidelines for Instructor Training and Qualification. To be accredited and re-accredited, companies will need to address the initial and continuing instructional skills development required. The initial training of instructors presents a special challenge since only a few new instructors will be employed by most companies over the next few years. Another challenge that must be dealt with is providing individualized remedial instruction to remove performance deficiencies identified during staff evaluations. This presentation explains how a group of concerned companies formed the Electric Utility Instructor Training Consortium to address this problem in a cost-effective and time-efficient manner. It further explains how these companies collaborated with the Ohio State University to conduct job and task analysis, develop performance-based instructor modules, conduct a field review of the modules, and revise and publish the 18 modules. Further, the presentation explains how companies like Duke Power and Virginia Power have organized their instructor training programs to provide for both effective and efficient initial instructor training, advanced training, and continuing development.

36062 (CONF-890470– VI.A.2.1-VI.A.2.12) **Evaluating learning strategies in operator training programs.** Quinlan, N. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

Effective and efficient operator training depends, to a large degree, on the learning strategies planned and implemented by the instructor. An understanding of recent related instructional design theories and the learning strategies that emerge from them can provide instructors with powerful tools to help operator trainees achieve success with their learning. An overview of three theories is provided. The depth of knowledge available in these theories can also be used to develop evaluation criteria to determine the effectiveness of selected learning strategies before and during lesson delivery.

36063 (IREM–86) **Dutch nuclear programme. Role of the Dutch industry.** Electrowatt Engineering Services Ltd., Zurich (Switzerland); Industriele Raad voor Energie- en Milieutechnologie (IREM), The Hague (Netherlands). Jan 1986. 142p. Order Number DE89617453/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Engineering Services Ltd. has, in fulfillment of its contractual commitment to the Dutch Industrial Council for Energy and Environment Technology (IREM), investigated the broad capability of the Dutch industry in playing a major role in the supply of goods and services for the construction of nuclear plants in the Netherlands. The findings are summarized in this document. 5 tabs.

36064 The economics of nuclear power: further evidence on learning, economies of scale, and regulatory effects. Cantor, R. (Oak Ridge National Laboratory, TN (USA)); Hewlett, J. *Resources and Energy (Netherlands),* 10(4): 315-335 (Dec 1988).

A major reason for the current problems of the nuclear industry is the unprecedented increase in construction costs over time. Cost

and leadtime data on 67 completed and nearly complete nuclear plants are used to examine the underlying sources of cost increases. The study is distinguished from other work on nuclear power costs by the approach used to derive the real, overnight construction costs. The results identify an important and overlooked relationship among size, construction leadtime, and overnight costs. 24 refs., 1 fig., 2 tabs.

22 NUCLEAR REACTOR TECHNOLOGY

36065 (INIS-SU–76) **Physics and technology of atomic reactors. Scientific-technical collection.** Voprosy atomnoj nauki i tekhniki. no. 1. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. 112p. (In Russian). Order Number DE89012164/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

36066 (CONF-890470– VI.B.2.1-VI.B.2.5) **Degree education on-site, on-line, on-time.** Mueller, J.R. (Wisconsin Public Service Corp., Green Bay (USA)); Janke, T.A.; Fisher, J.R. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

Nuclear utilities efforts in response to industry wide pressures to provide operations staff with degree opportunities have encountered formidable barriers. This paper describes the development and operation of the University of Maryland University College (UMUC) special baccalaureate degree program in nuclear science. This program has successfully overcome these barriers to provide degree education on-site, on-line, and on-time.

36067 (CONF-890470– VI.B.5.1-VI.B.5.12) **Simulator application in a nuclear technology degree program.** Sherrard, J.R. (Thames Valley State Technical College, Norwich, CT (USA)); Burchill, W.E. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

Thames Valley State Technical College in Norwich, Connecticut is in its sixth year of providing an Associate's Degree Program in Nuclear Engineering Technology. A major distinguishing characteristic of this program is the use of a fundamentals nuclear reactor training simulator in the sixth (final) quarter of the curriculum. This paper describes the Thames Valley Nuclear Technology Curriculum, the Nuclear Reactor Simulator course in this curriculum, and the importance of the simulator in the application for accreditation of the Nuclear Engineering Technology Program by the Accreditation Board for Engineering and Technology.

36068 (CTA-EAv-CPD-SC–019/81) **Implatation of MC2 computer code.** Seehusen, J.; Nair, R.P.K.; Becceneri, J.C. Centro Tecnico Aeroespacial, Sao Jose dos Campos, SP (Brazil). Inst. de Atividades Espaciais. 5 Oct 1981. 35p. (In Portuguese). Order Number DE89620446/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The implantation of MC2 computer code in the CDC system is presented. The MC2 computer code calculates multigroup cross sections for tipical compositions of fast reactors. The multigroup constants are calculated using solutions of PI or BI approximations for determined buckling value as weighting function. (M.C.K.).

36069 (INIS-SU–76, pp. 20-25) **To the study of dynamics of a homogeneous reactor with circulating fuel.** Zolotarev, S.L. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Physics and technology of atomic reactors. Scientific-technical collection.* Order Number DE89012164/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 1.

Using the BOUND program package, the dynamics of a homogeneous molten salt reactor with circulating fuel is investigated. Besides linear analysis of stability, the character of obtained boundary of stationary mode stability region is considered, and approximate values for auto-oscillations at parameters corresponding to the working mode instability region are calculated. The conclusion is made that the obtained boundary of stability region is safe over the whole considered range of parameter change, which described the distribution of neutron-physical properties of the system. A soft mode of auto-oscillation excitation is observed in the system. 11 refs.; 4 figs.

36070 (INIS-SU–76, pp. 35-41) **Systems with aftereffect in nuclear reactor dynamics.** Goryachenko, V.D. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Physics and technology of atomic reactors. Scientific-technical collection.* Order Number DE89012164/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 1.

A brief review of studies on nonlinear mathematical models of nuclear reactor dynamics as the objects with aftereffect, caused by transport delay and other reasons, is given. Special attention is paid to works on studies of auto-oscillations in reactors. 25 refs.; 5 figs.

36071 (INIS-SU–76, pp. 57-69) **Methods and programs for calculating dynamics of thermal-hydraulics processes in nuclear reactors.** Selivanov, V.M.; Leonchuk, M.P.; Kornienko, Yu.N. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Physics and technology of atomic reactors. Scientific-technical collection.* Order Number DE89012164/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 1.

Modern state and development prospects of model descriptions of the dynamics of thermophysical and hydrodynamic processes in single- and two-phase flows are considered. A brief review of existing methods and programs used in calculations of transient and emergency modes in NPPs, by-channel analysis of reactor cores, and also for solution of three-dimensional problems on determination of nuclear reactor thermohydraulic characteristics on the whole and its elements in particular, is presented. 73 refs.; 3 figs.; 2 tabs.

36072 (INIS-SU–85) **Nuclear reactor physics and technology. Scientific-technical collection.** Voprosy atomnoj najki i tekhniki. no. 2. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. 91p. (In Russian). Order Number DE89012154/JAW. Available from NTIS (US Sales Only), PC A05/MF A01.

Individual papers in this collection are separately indexed.

36073 (INIS-SU–85, pp. 3-10) **Approximation of the slowing-down equation solution by the discontinuous finite element method.** Sataev, E.A.; Vorotyntsev, M.F.; Rinejskij, A.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Nuclear reactor physics and technology. Scientific-technical collection.* Order Number DE89012154/JAW. Available from NTIS (US Sales Only), PC A05/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 2.

Consideration is given to the problem of the slowing-down equation solution approximation employing the discontinuous finite

element method. The theorems on the convergence of the approximate solutions to the exact ones are proved, with the basis functions number being increased in two different ways. The examples of calculations are given. 9 refs.; 4 figs.; 1 tab.

36074 (INIS-SU–85, pp. 16-19) **Technique for multigroup calculation of a two-dimensional reactor in neutron energy slowing-down and thermalization ranges with burnup accounting.** Artem'ev, N.I.; Dekusar, V.M.; Kalashnikov, A.G.; Moseev, A.L. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Nuclear reactor physics and technology. Scientific-technical collection.* Order Number DE89012154/JAW. Available from NTIS (US Sales Only), PC A05/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 2.

Technique for multigroup two-dimensional calculation of a reactor in particular containing strongly shielded burnable poisons taking into account changes in isotope composition as a result of burnup, is considered. Solution of diffusion equation in a group is based on high-efficient modification of the alternative direction method. 7 refs.

36075 (INIS-SU–85, pp. 20-24) **Difference schemes for solving the equation of the discrete ordinate method in the (Δ,Z) geometry.** Suslov, I.R. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Nuclear reactor physics and technology. Scientific-technical collection.* Order Number DE89012154/JAW. Available from NTIS (US Sales Only), PC A05/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 2.

Two difference schemes to solve transport equations using the method of discrete ordinates in (Δ,Z)-geometry are suggested. The first one is based on linear relation between angular fluxes averaged by input and output faces and by the whole calculation cell. The second one is based on the equation integration along characteristics within the calculation cell in the assumption of equality to a constant of angular fluxes on input faces and spatially distributed sources. Results of numerical solution of the model problem show that with the net tightness the error decreases in proportion to the calculated cell side. 7 refs.; 3 figs.

36076 (INIS-SU–85, pp. 24-33) **Use of the Monte Carlo method for verification of the accuracy of modern methods for heterogeneous reactor calculations.** Gomin, E.A.; Majorov, L.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Nuclear reactor physics and technology. Scientific-technical collection.* Order Number DE89012154/JAW. Available from NTIS (US Sales Only), PC A05/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 2.

Numerical analysis of accuracy of the surface flux method, used for the calculation of power reactor heterogeneous lattices, is carried out. Results of the calculations made for model lattices of the WWER-440 type reactors using the Monte Carlo and surface flux methods are compared, and sufficiently high accuracy of balance equations, on which the surface flux method is based, is demonstrated. However, the accuracy depends considerably on the choice of the balance equation coefficients, which in its turn is determined by the quality and detailed character of neutron spectrum apriory description in separated cells. 12 refs.; 3 figs.; 7 tabs.

36077 (INIS-SU–85, pp. 44-54) **On geometric simulating in nuclear reactor calculations by the Monte-Carlo method.** Ostashenko, S.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Nuclear reactor physics and technology. Scientific-technical collection.* Order Number DE89012154/JAW. Available from NTIS (US Sales Only), PC A05/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 2.

Analysis of existing geometric modules makes it possible to reveal their disadvantages and to formulate requirements list, which should be satisfied by any usefull geometry system. Short description of GDL language used for complex reactor systems simulating is given. GDL language applies hierarchical representation scheme to assemblies, which aids to reduce significantly amount of input data. The language is part of GDL geometry system designed for MCU package and implemented on ES computers. 15 refs.; 10 figs.

36078 (INIS-SU–85, pp. 69-70) **ARADAR program abstract.** Glushkov, E.S.; Petushkova, N.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Nuclear reactor physics and technology. Scientific-technical collection.* Order Number DE89012154/JAW. Available from NTIS (US Sales Only), PC A05/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 2.

A description of the ARADAR program for solution of the one-dimensional multigroup equations of reactors (cells) in P_1-approximation for plan, cylindrical and spherical geometry is presented. The program is connected automatically with the 26-group microconstant library including 46 chemical elements. 5 refs.

36079 (INIS-SU–85, pp. 71-72) **Abstract of the RADIKF and RADIKF-ES programs.** Boyarinov, V.F. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Nuclear reactor physics and technology. Scientific-technical collection.* Order Number DE89012154/JAW. Available from NTIS (US Sales Only), PC A05/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 2.

The RADIKF and RADIKF-ES codes for calculation of few-group matrix of the diffusion coefficients in cylindrical reactor cell are shortly described. 9 refs.

36080 (INIS-SU–85, pp. 56-60) **DEMETRA-ES program.** Trukhanov, G.Ya.; Maglevannyj, I.I.; Abdullaev, Kh.Sh. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Nuclear reactor physics and technology. Scientific-technical collection.* Order Number DE89012154/JAW. Available from NTIS (US Sales Only), PC A05/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 2.

The DEMETRA-ES code for the calculation of neutron thermalization in one-dimensional heterogeneous systems for general boundary conditions and arbitrary thermal neutron source by the quasi-diffusion method is shortly described. 13 refs.

36081 Boundary treatment of the diffusion synthetic acceleration method for fixed-source discrete-ordinates problems in x-y geometry. Valougeorgis, D. (9518410). *Nuclear Science and Engineering (USA),* 100(2): 142-148 (Oct 1988).

A study on the development of acceleration equations for boundary cells and the associated boundary conditions for the diffusion synthetic acceleration method of neutron transport problems in x-y geometry is described. Alcouffe's algebraic manipulation of the P_1 equations resulting in a single diffusion equation is modified to obtain explicit acceleration equations for the boundary cells. To accomplish this, the discretization in space is performed according to the ordinary box-centered method. The resulting synthetic computation scheme is linear in its differenced form. The boundary cell difference equations are derived in a manner that exactly parallels the discretization of the diffusion equation for interior mesh cells and that of the transport equation. The importance of these equations in improving overall efficiency without sacrificing stability is discussed, as is the optimum choice of the boundary conditions associated with these equations.

36082 (CONF-890721–11) **An experimental study of the effect of stainless steel cladding on the structural integrity of flawed steel plates in bending.** Iskander, S.K.; Nanstad, R.K.; Robinson, G.C.; Oland, C.B. Oak Ridge National Lab., TN (USA). 1989. 17p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC05-84OR21400. From Joint ASME/JSME pressure vessel and piping conference; Honolulu, Hawaii, USA; 23-27 Jul 1989. Order Number DE89008735/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A small crack near the inner surface of clad nuclear reactor pressure vessels is an important consideration in the safety assessment of the structural integrity of the vessel. Experimental results from tests on large clad and unclad plate specimens with surface flaws have shown that (1) a tough surface layer composed of cladding and/or heat-affected zone has arrested running flaws in clad plates under conditions where unclad plates have ruptured, and (2) the residual load-bearing capacity of clad plates with large subclad flaws significantly exceeded that of an unclad plate. The fracture surfaces of unclad plates suggest that the flaw evolves through alternately tunneling then breaking to the surface. In the case of clad plates, it is hypothesized that the tough, strong surface layer inhibits the tunneled flaw from propagating to the surface.

36083 (CONF-890721–12) **Evaluation of weldment creep and fatigue strength-reduction factors for elevated-temperature design.** Corum, J.M. Oak Ridge National Lab., TN (USA). 1989. 30p. Sponsored by DOE Nuclear Energy. DOE Contract AC05-84OR21400. From Joint ASME/JSME pressure vessel and piping conference; Honolulu, Hawaii, USA; 23-27 Jul 1989. Order Number DE89008242/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

New explicit weldment strength criteria in the form of creep and fatigue strength-reduction factors were recently introduced into the American Society of Mechanical Engineers Code Case N-47, which governs the design of elevated-temperature nuclear plants components in the United States. This paper provides some of the background and logic for these factors and their use, and it describes the results of a series of long-term, confirmatory, creep-rupture and fatigue tests of simple welded structures. The structures (welded plates and tubes) were made of 316 stainless steel base metal and 16-8-2 weld filler metal. Overall, the results provide further substantiation of the validity of the strength-reduction factor approach for ensuring adequate life in elevated-temperature nuclear component weldments. 16 refs., 7 figs.

36084 (CONF-890721–15) **Effect of peak thermal strain on simplified ratchetting analysis procedures.** Sartory, W.K. Oak Ridge National Lab., TN (USA). 1989. 25p. Sponsored by DOE Nuclear Energy. DOE Contract AC05-84OR21400. From Joint ASME/JSME pressure vessel and piping conference; Honolulu, Hawaii, USA; 23-27 Jul 1989. Order Number DE89008745/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Omission of peak strain in the O'Donnell-Porowski simplified ratchetting rules of ASME Code Case N-47, which governs design of elevated-temperature nuclear components, can lead to nonconservatism. The O'Donnell-Porowski method is therefore modified in this paper to include peak strain. The revised technique eliminates nonconservatism that was originally found in comparing the simplified rules with the results of two- and three-dimensional analyses and that was used as a basis for restricting the O'Donnell-Porowski method to one-dimensional geometries. Since the new method is found to be conservative in all the one-, two-, and three-dimensional problems in which it is has been tested, it is under consideration by the code for inclusion in N-47 without restriction as to dimensionality. 7 refs., 5 figs., 2 tabs.

36085 (CONF-890721–29) **Nonlinear behavior of a containment building during an earthquake.** Hsieh, B.J.; Kot, C.A.; Srinivasan, M.G.; Costello, J.F. Argonne National Lab., IL (USA). 1989. 15p. Sponsored by Nuclear Regulatory Commission. DOE Contract W-31109-ENG-38. From Joint ASME/JSME pressure vessel and piping conference; Honolulu, Hawaii, USA; 23-27 Jul 1989. Order Number DE89012428/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The nonlinear behavior of a 1/4-scale containment structure subjected to strong motion earthquake excitation is investigated by analyzing acceleration measurements on the structure and the site/soil surrounding the structure. Acceleration transfer functions obtained from the ratios of Fourier Transforms provide the means to estimate the dynamic characteristics of the soil-structure system. These are compared with results obtained from low-level vibration testing of the structure. Due to strong nonlinear effects during strong-motion excitation the fundamental frequency decreases by about 40% relative to the value obtained in low-level vibration tests (2.3 vs 3.8 Hz). In addition, this frequency as well as the shape of the transfer function moduli vary considerably with time during the strong motion excitation. This preliminary investigation indicates that the analysis of earthquake responses coupled with the results of low level vibration tests provide a means to gain understanding of the nonlinear behavior of soil-structure systems during strong motion, and may lead to the improvement in the modeling of soil-structure interaction phenomenology. 8 refs., 6 figs.

36086 (EPRI-NP–6212-M) **A finite-element model for eddy-current nondestructive evaluation: Final report.** Lord, W. Electric Power Research Inst., Palo Alto, CA (USA); Colorado State Univ., Fort Collins, CO (USA). Dept. of Electrical Engineering. c Jun 1989. 100p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Eddy current nondestructive testing techniques are used widely throughout the utility industry for the early detection of defects in critical power plant components such as steam generator tubing. An important aspect of the testing procedure is the evaluation of the eddy current signals to yield information about defects in the part under test. Research effects are underway to automate this process of defect characterization and hence make it more reliable and faster than currently used techniques involving human operators. One major factor which has limited progress towards development of a viable defect characterization scheme for eddy current testing has been the lack of a general mathematical model capable of predicting the complex electromagnetic field/defect interactions in the part under test. A major objective of this research project has been to develop finite element computer code capable of modeling eddy current NDT phenomena of interest to the utilities. Results of numerical studies are described in this report which clearly show the viability of the finite element technique as a general purpose mathematical model, capable of predicting eddy current probe signals from realistic nondestructive testing situations. 43 refs., 47 figs., 5 tabs.

36087 (INIS-SU–76, pp. 25-35) **Equation derivation and studying the dynamics of NPP cooling systems.** Smirnov, L.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Physics and technology of atomic reactors. Scientific-technical collection.* Order Number DE89012164/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 1.

It is suggested that the apparatus of analytical mechanics for bodies with variable mass should be used to obtain equations of incompressive coolant flow and to study the dynamics of NPP circulation systems. The approach is based on derivation of the Bernoulli equation for unsteady flow from the Lagrangian equation of the second type for a body a variable content like a pipeline. Equations for the main elements of the systems are derived, mathematical model of multiloop circulation system dynamics typical for the WWER reactors is presented and stability of equilibrium mode is studied. Dynamics of flow rate change in the case of switching off and subsequent run-out of one of the operating main circulation pumps (MCP) is considered, and it is shown that at the moment of the MCP cutting-off a rapid flow rate change takes place. 15 refs.; 4 figs.

36088 (INIS-SU–84/A, pp. 19-29) **Method for calculating plane reinforced concrete elements of walls and ceilings in power plant structures under limiting loads.** Smirnov, S.B. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1987. (In Russian). In *Design and construction. Scientific-technical collection.* Order Number DE89012163/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 3.

General method for determining limiting loads on any plane-stressed and plane-deformed element is suggested. It is realized in details for calculating composite parts of NPP walls and ceilings, serving as stif fening diaphragms, short elements and wall beams. The method is based on revealing compressed-extended and other dangerous uniformly stressed zones by construction of equilibrium piecewise-homogeneous stress fields with minimal number of zones. General principles of constructing fields, containing plastic zones, analogous to real dangerous zones, are developed. 8 refs.; 3 figs.

36089 (INIS-SU–84/A, pp. 30-37) **Determining the carrying capability of composite plates in power plant structures taking into account attenuating effect of joints in them.** Smirnov, S.B. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1987. (In Russian). In *Design and construction. Scientific-technical collection.* Order Number DE89012163/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 3.

It is proved that the presence of weak joints showed be taken into account when evaluating overall strength of NPP composite elements. Complicated character of the problem in the general case is shown. Principles and examples of solution are given for the commonest NPP elements, namely composite plates of ceilings. Formulae, enabling to take into account the influence of joint brittleness on carrying capability of such plates, are obtained. 1 fig.

36090 (INIS-SU–84/A, pp. 38-46) **Cracking and rupture of a prestressed reinforced concrete high-pressure vessel.** Nikolaev, Yu.B.; Zertsalov, M.G.; Shargorodskij, M.A.; Shipilov, Yu.Ya. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1987. (In Russian). In *Design and construction. Scientific-technical collection.* Order Number DE89012163/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 3.

Theoretical methods for evaluating cracking in prestressed reinforced concrete high-pressure vessels of reactors are considered. Approximate evaluation of the vessel stressed state is given; possible ways of crack propagation are analyzed. 6 refs.; 4 figs.

36091 (NUREG/CR–5222) **Static load cycle testing of a low-aspect-ratio six-inch wall TRG-type structure TRG-4-6 (1.0, 0.25).** Farrar, C.R.; Bennett, J.G.; Dunwoody, W.E.; Baker, W.E. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Engineering; Los Alamos National Lab., NM (USA). Jun 1989. 23p. Sponsored by Nuclear Regulatory Commission. DOE Contract W-7405-ENG-36. (LA–11422-MS). Available from NTIS, PC A03/MF A01 - GPO - OSTI.

Quasi-static load cycle testing of a 6-in.-thick reinforced concrete shear wall structure is detailed in this report. The background of this program and results that led to this series of experiments are reviewed. Geometry of the tests structure, design parameters, preliminary modal testing and analysis to verify undamaged dynamic properties, material property tests, instrumentation ad results of this data reduction for stiffness, cracking values, and energy losses are given. Results are compared with other investigators' results as well as with the American Concrete Institute 318-349 code predictions. 32 refs., 101 figs., 11 tabs.

2203 Fuel Elements

36092 (INIS-SU–85, pp. 72-73) **ELL program abstract.** Sergeeva, L.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Nuclear reactor physics and technology. Scientific-technical collection.* Order Number DE89012154/JAW. Available from NTIS (US Sales Only), PC A05/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 2.

The ELL code makes it possible to calculate the stressed-strained state in fuel cans both under stationary conditions and during accidents. The calculation is carried out with allowance for an initial ovality and anisotropy of fuel can properties. 5 refs.

36093 (STUDSVIK-STSR–23-Rev.) **Non-destructive examinations of PW 5 rods: The Studsvik Super-Ramp Project.** Bergenlid, U.; Birath, S.; Bivered, B.; Brisling, A.; Lysell, G. Studsvik Energiteknik AB, Nykoeping (Sweden). Dec 1982. 28p. Sponsored by DOE Nuclear Energy. DOE Contract FG06-80ET34032. Order Number DE89013249/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; GPO Dep.

The following non-destructive examinations have been performed on four PW 5 rods: visual inspection, eddy current (EC) testing, dimensional measurement, gamma scanning, and neutron radiography. This document discusses the results of this testing.

2204 Control Systems

36094 (CONF-890673–1) **Supervisory control in a distributed, hierarchical architecture for a multimodular LMR.** Otaduy, P.J.; Brittain, C.R.; Rovere, L.A. Oak Ridge National Lab., TN (USA). 1989. 11p. Sponsored by DOE Nuclear Energy. DOE Contract AC05-84OR21400. From IWGFR specialists meeting on advanced controls for fast reactors; Argonne, IL, USA; 20-22 Jun 1989. Order Number DE89014764/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This paper describes the directions and present status of the research in supervisory control for multimodular nuclear plants being conducted at Oak Ridge National Laboratory (ORNL) as part of US Department of Energy's (DOE) Advanced Controls Program. First, the hierarchical supervisory control structure envisioned for a Power Reactor Inherently Safe Module (PRISM) multimodular LMR is discussed. Next, the architecture of the supervisory module closest to the process actuators and its implementation for demonstration in a network of CPU's are presented. 12 refs., 3 figs.

36095 (EPRI-NP–6067-Vol.2) **Surveillance of instrumentation channels at nuclear power plants: Volume 2, An approach to classifying problems and solutions: Final report.** Thie, J.A. Electric Power Research Inst., Palo Alto, CA (USA); Thie (J.A.), Knoxville, TN (USA). c Jun 1989. 35p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Surveillance activities at nuclear plants, involving-calibrations, functional tests, and simple checks, have many associated problems. These problems are of the following four types: administrative, equipment, human, and systemic. An extensive search of the literature has led to 63 generic classes of problems falling within these types and involving instrumentation department activities. The classification system is that which writers of incidents are essentially using, based on historical traditions, in naming their problems' causes. An interesting finding in the search was the strong correlation of this project to many aspects of industrial safety; technology transfer opportunities from the latter are identified. A survey of plant instrumentation experts was conducted to obtain a ranking of the most important problems. Classes of solutions to these problems are listed and discussed. Outlined is a possible methodoiogy of matching these solutions to problems. Finally applications of this study are listed, and include extensions to training, operations, and maintenance departments of power plants. Appendices give several general examples for each problem class and many specific suggestions from experts on addressing the problems felt to be more important. 15 refs., 2 figs., 6 tabs.

36096 (EPRI-NP–6337) **Vibration monitoring of main coolant pumps: Guideline and reference data: Final report.** Hartlen, R.T. Electric Power Research Inst., Palo Alto, CA (USA); Ontario Hydro Research Div., Toronto, ON (Canada). c May 1989. 103p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

User needs for vibration monitoring and Diagnostics of PWR/BWR Reactor Coolant and Recirculation Pumps were identified by a survey. The required contents for a proposed computer-based

ADVISOR were specified. It addresses instrumentation, data acquisition and analysis; analytical modelling of machine dynamics; test procedures; limits for alert and action; and diagnosis. Heavy emphasis is placed on developing a fault-symptoms matrix specific to machines of the Reactor Coolant/Recirculation pumpset configuration. Also emphasized is the use of actual relevant case histories as the essential data base. Based upon information available, an initial, partial version of the ADVISOR was assembled in hard copy form. Recommendations are made for the further work required to complete the ADVISOR. This report provides the final results for EPRI Project RP1556-4. 3 refs., 1 fig., 1 tab.

36097 (IAE–4557/15) **Support system for loop device operator. Analysis of technological processes.** Yakovlev, V.V.; Mozhaev, A.A.; Lyadin, A.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Inst. Atomnoj Ehnergii. 1988. 32p. (In Russian). Order Number DE89620234/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The paper presents the results obtained from the analysis of controlling the loops of a research reactor. A method of optimized interaction of the operator and hardware of the control system by computeraided identification of the cause of regime violation is considered. The equipment diagnostics based on use of the expert system methods and tuzzy algorithms enables to propose a support system for application in new generation of loops. 11 refs.; 8 figs.; 15 tabs.

36098 (INFO–0247) **Computer software configuration management.** Pelletier, G. Atomic Energy Control Board, Ottawa, ON (Canada). Aug 1987. 57p. Order Number DE89620235/JAW. Available from NTIS (US Sales Only), PC A04/MF A01 - OSTI; INIS.

This report reviews the basic elements of software configuration management (SCM) as defined by military and industry standards. Several software configuration management standards are evaluated given the requirements of the nuclear industry. A survey is included of available automated tools for supporting SCM activities. Some information is given on the experience of establishing and using SCM plans of other organizations that manage critical software. The report concludes with recommendations of practices that would be most appropriate for the nuclear power industry in Canada.

36099 (INIS-SU–76, pp. 42-46) **Dynamics of a reactor with discrete control system under restriction on the control action value.** Postnikov, N.S. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Physics and technology of atomic reactors. Scientific-technical collection.* Order Number DE89012164/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 1.

Algorithm of reactor power control, according to which the control effect is restricted and introduced in discrete time moments ntau, is studied. The value of the reactivity introduced is chosen so as to compensate in the maximum the neutron flux perturbation, appearing to the ntau time moment. It is shown that when tau parameter passes the value tau_{cr}, critical as to stability condition, the stochastic auto-oscillations appear, which are generated by the determinated system when there are no accidental parameters or accidental external perturbations in it. In the reactor parameters space the stochasticity range is determined and the maximum value of neutron flux deviation from the stationary value in the mode of steady oscillations is obtained. 5 refs.; 2 figs.

36100 (INIS-SU–76, pp. 46-57) **Reactor power stabilization using a discrete control system.** Migalov, I.V.; Postnikov, N.S. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Physics and technology of atomic reactors. Scientific-technical collection.* Order Number DE89012164/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 1.

Algorithm of reactor power control, according to which control effect is introduced only in discrete time moments ntau by equal parts $+\Delta R$ or $-\Delta R$, depending on the sign of power deviation from the stationary value, is considered. It is shown that there are restricted motions in control system if the control interval tau does not exceed the critical value tau_{cr} and stochastic auto-oscillations are the only type of unsteady motions. The dependences of tau_{cr} on reactor parameters are obtained. The attracting sets (strange attractors) are obtaied. The maximum amplitude of autooscillations is determined. It is shown that by special choice of tau, ΔR parameters the oscillation amplitude can be reduced below any given value, thus ensuring the attraction region of stationary motions of any required dimensions. In this case the control system considered can be quite acceptable for slow process stabilization in a reactor. 11 refs.; 8 figs.

36101 (INIS-SU–76, pp. 69-70) **Structural redundance of NPPs and diagnostics.** Znyshev, V.V.; Sabaev, E.F. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Physics and technology of atomic reactors. Scientific-technical collection.* Order Number DE89012164/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 1.

A new approach to functional diagnosis of NPP state based on structural redundance, owing to which in major of the facilities there are elements identical as to the structure and operational conditions, is suggested. The difference from zero by the given value for one parameter measured for various identical elements is an indicator of a failed element and a signal for diagnostic analysis. 3 refs.

36102 (INIS-SU–76, pp. 71-76) **On some methods of NPP functional diagnostics.** Babkin, N.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Physics and technology of atomic reactors. Scientific-technical collection.* Order Number DE89012164/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 1.

Methods for NPP functional diagnosis, in which space and time dependences for controlled variable anomalous deviations change are used as characteristic features, are suggested. The methods are oriented for operative recognition of suddenly appearing defects and envelop quite a wide range of possible anomalous effects in an onject under diagnostics. Analysis of transients dynamic properties caused by a failure is realized according to the rules, which do not depend on the character of anomalous situation development. 8 refs.; 1 fig.

36103 (INIS-SU–76, pp. 76-82) **On an approach to NPP diagnostics automation.** Babkin, N.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Physics and technology of atomic reactors. Scientific-technical collection.* Order Number DE89012164/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 1.

A method for early detection of the reasons for suddenly appearing anomalous situations, which unites different methods of functional diagnosis, based on using systems dynamic properties, is suggested. The process of failure recognition, independently of the plant operational conditions and the character of controlled variables change is realized when characteristics features of an anomalous process are revealed by means of three efficiently interacting and complementing each other algorithms, permitting a simple program realization. 5 refs.

36104 (INIS-SU–76, pp. 82-87) **Failed element monitor for a NPP.** Znyshev, V.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In

Physics and technology of atomic reactors. Scientific-technical collection. Order Number DE89012164/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 1.

The problem of failed NPP element identification is interpreted as a typical one for the control theory with required trajectory realization, where possible failures are considered as desired control actions. The design principles of a device, solving the problem for the case of linear mathematical description of dynamics of NPP element controlled values when failures appear, are presented. 10 refs.

36105 (INIS-SU–76, pp. 88-89) **Automation of confidence control for the initial measured data at in-situ level of on-line control system at NPPs with RBMK reactors.** Gorobunov, V.P.; Karpan, N.V.; Saprykin, E.M.; Vorb'ev, V.P. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Physics and technology of atomic reactors. Scientific-technical collection.* Order Number DE89012164/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 1.

A subsystem for an on-line control system of a NPP with RBMK type reactor, designed for queueing automated confidence control of preliminary technological data and the balances of energy and mass exchange in the reactor, is considered. The subsystem solves the following concrete problems: ascertaining of controlled process stationary character and calculation of mathematical expectation and root-mean-square deviation of controlled parameters for each stationary section; tests of primary temperature meters pressure gauges by two independent conditions, evaluation of true values of the main thermal parameters of a power unit, evaluation of summary systematic errors of the corresponding primary measurement devices, control of coolant flowmeters. 2 refs.

36106 (INIS-SU–76, pp. 90-92) **Experience in using the in-situ subsystem providing reactor operation in on-line control system of the Smolensk NPP.** Komarov, V.I.; Isaev, N.V.; Shkurkina, V.M.; Shmonin, Yu.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Physics and technology of atomic reactors. Scientific-technical collection.* Order Number DE89012164/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 1.

The structure and operational experience for a subsystem used in and in-situ on-line control system of NPPs with RBMK type reactors, ensuring physical calculations of the reactor in the process of its operation and planning of continuous and partial refueling an other purposes, are considered. 6 refs.; 1 fig.

36107 (INIS-SU–76, pp. 96-100) **Method for calculating optimal rules of making the decisions about accidents in commercial equipment.** Kozin, I.O.; Ostrejkovskij, V.A.; Sal'nikov, N.L. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Physics and technology of atomic reactors. Scientific-technical collection.* Order Number DE89012164/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 1.

The method suggested is applicable for the equipment, the emergency state of which is controlled by wrong parameters. The problem to be solved is formulated in the following way: how, successively observing the measured process values the problem on the moment of alarm signal begin in the case of an accident but so, that (on the one side) to avoid false alarm and (on the other side) that the time between the moments of alarm signal and the accident will be the minimum one can be solved. The optimal solution on the equipment switching-off is made by the criterion of economic loss minimization due to its realization. It is considered that alarm settings can be the decisive rules for localization of failure point. Wrong recognition of accident point results in economic expenses, which also affect the value of settings. 9 refs.

36108 (INIS-SU–85, pp. 36-43) **Methods of power distribution determination using the signals from out-of-pile detectors.** Dirkov, I.V.; Kaminskij, A.S. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Nuclear reactor physics and technology. Scientific-technical collection.* Order Number DE89012154/JAW. Available from NTIS (US Sales Only), PC A05/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 2.

Taking into account peculiarities of the HTGR type reactors operating according to once-through-then-out principle methods of power density distribution control using the indices of out-of-pile detectors are considered. Methods based on using the detector response functions for single sources are discussed. It is shown that an increase in the detection energy threshold weakens considerably the sensitivity of the detector response function to the reactor parameter variations. During the detection of epithermal and fast neutrons matrix stability for energy release field reconstruction is practically ensured which increases the control efficiency and accuracy. To refine the energy release field the results of gas temperature measurements at the core outlet can be used. 15 refs.; 3 tabs.

36109 Development and application of AI technology to plant operation and support. Sackett, J.I. (Argonne National Lab., Idaho Falls, ID (USA)); Mott, J.E. *Nuclear Engineering and Design (Netherlands),* 113(2): 229-240 (Apr 1989). (CONF-870832–: Topical meeting on artificial intelligence and other innovative computer applications in the nuclear industry: present and future, Snowbird, Utah, USA, 31 Aug - 2 sep 1987).

This paper discusses a framework for the development and application of artificial intelligence (AI) technology in existing nuclear facilities and reviews the status of development. We consider those areas best addressed by AI technology, e.g., equipment diagnostics, sensor validation, and expert systems for procedural response or planning. A brief discussion of work in computer displays is also given.

36110 (CONF-890546–7) **Correlation of recent fission product release data.** Kress, T.S.; Lorenz, R.A.; Nakamura, T.; Osborne, M.F. Oak Ridge National Lab., TN (USA). 1989. 10p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC05-84OR21400. From Seminar on fission product transport processes in reactor accidents; Dubrovnik, Yugoslavia; 22-26 May 1989. Order Number DE89012972/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

For the calculation of source terms associated with severe accidents, it is necessary to model the release of fission products from fuel as it heats and melts. Perhaps the most definitive model for fission product release is that of the FASTGRASS computer code developed at Argonne National Laboratory. There is persuasive evidence that these processes, as well as additional chemical and gas phase mass transport processes, are important in the release of fission products from fuel. Nevertheless, it has been found convenient to have simplified fission product release correlations that may not be as definitive as models like FASTGRASS but which attempt in some simple way to capture the essence of the mechanisms. One of the most widely used such correlation is called CORSOR-M which is the present fission product/aerosol release model used in the NRC Source Term Code Package. CORSOR has been criticized as having too much uncertainty in the calculated releases and as not accurately reproducing some experimental data. It is currently believed that these discrepancies between CORSOR and the more recent data have resulted because of the better time resolution of the more recent data compared to the data base that went into the CORSOR correlation. This document discusses a simple correlational model for use in connection with NUREG risk uncertainty exercises. 8 refs., 4 figs., 1 tab.

36111 (TVA/WR/AB–89/3) **Plankton studies at Sequoyah Nuclear Plant in 1988.** Dycus, D.L. Tennessee Valley Authority, Chattanooga, TN (USA). River Basin Operations/Water Resources. Mar 1989. 67p. Sponsored by Tennessee Valley Authority. Order Number DE89014509/JAW. Available from NTIS, PC A04/MF A01 - OSTI.

Previous studies have indicated Sequoyah Nuclear Plant (SQN) may have a substantial effect on plankton during periods of two unit operation combined with low river flows. Coincidental occurrence of two unit operation and more normal flows was not encountered during previous studies to determine if these effects were observed under less severe conditions. Continued plankton studies are aimed at evaluating the effect of SQN on plankton under full plant operation and river flows more commonly encountered. In August 1985, after the recommendation was made to continue plankton evaluations, both units at SQN were shut down and remained down until 1988. Unit 2 was restarted in April 1988. Unit 1 began intermittent operation late in 1988. In the absence of conditions recommended for continued study, sampling protocols were altered in 1986, 1987, and 1988. Studies conducted in 1986 and 1987 were reported previously (TVA 1988a) and sent to the Tennessee Department of Health and Environment in January 1988 in fulfillment of an agreement to provide an annual status report on the continued plankton studies. Studies conducted in 1988 are summarized herein. These studies emphasized in-plant conditions rather than reservoir conditions to determine the effect on plankton organisms passing through the plant. 3 refs., 17 tabs.

In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

The Department of Energy's (DOE) Advanced Test Reactor (ATR) has been involved in Team and Diagnostic Skills training since the early part of 1988. This training was developed in-house utilizing material from numerous sources. To assist in achieving a high quality program that would be both well received by operations and effective in bringing positive behavior changes, concepts of adult learning were utilized in the development and implementation. This paper states the concepts and discusses how they were and continue to be used to develop, revise, and implement Team and Diagnostic Skills training at ATR.

36113 (CONF-890470– VI.B.3.1-VI.B.3.10) **Developing a performance based retraining program for the advanced test reactor (ATR) reactor operators and supervisors.** Betz, T.L. (EG and G Idaho, Inc., Idaho Falls (USA)). Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

The Department of Energy's (DOE) Advanced Test Reactor (ATR) is operated to support DOE's requirements for fuel and material irradiation data. In addition, limited space is made available to industry for materials irradiation and radioactive isotope production. The 250 MW(th) ATR was designed in the early 1960's, constructed in the mid 1960's and placed in operation in 1967. It has operated successfully for the past 22 years. Several improvements were made to the initial training and retraining programs after the Three Mile Island (TMI) accident to make them comply with DOE Order 5480.6 section 8e, Reactor Personnel Training and Qualification Program. This paper discusses these activities. In formulating the Performance Based Retraining program for ATR reactor operators and supervisors, industry experience, INPO Guidelines, DOE requirements, ANS 3.1, and the experience of 22 years of ATR operation/training were considered. This approach to retraining is consistent with INPO Guidelines and Good Practices, and DOE requirements. This paper addresses the following key elements in the development and implementation of a performance based retraining program: (1) selection of retraining items utilizing task analysis; (2) features of the program; (3) program evaluation; and (4) lessons learned after two years of conduct.

36114 (EGG-M–88332) **Plant life extension program for the Advanced Test Reactor.** Croucher, D.W.; Zeile, H.J. Idaho National Engineering Lab., Idaho Falls, ID (USA). 1989. 5p. Sponsored by DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-890721–17: Joint ASME/JSME pressure vessel and piping conference, Honolulu, Hawaii, USA, 23-27 Jul 1989). Order Number DE89009734/JAW. Available from NTIS, PC A02/MF A01 - OSTI.

The 250 MW_t Advanced Test Reactor (ATR) is a Department of Energy (DOE) facility that has operated successfully for the past 20 years at the Idaho National Engineering Laboratory (INEL) to support DOE's requirements for fuel and material irradiation data. The ATR also produces irradiated material and radioactive isotopes for industry. DOE anticipates that this facility will be needed well beyond the year 2014. To extend the safe operation life of the ATR and maximize its usefulness, researchers at the INEL are implementing an integrated program of (a) system and component aging evaluation, (b) design and safety documentation evaluation against regulatory requirements, and (c) probabilistic risk assessment. It is intended that the ATR Plant Life Extension activities fit within the regulatory framework being developed for utilities by the Nuclear Regulatory Commission. 12 refs., 1 fig., 2 tabs.

36115 (IAEA-R–3512-F) **Calculation analysis of TRIGA MARK II reactor core composed of two types of fuel elements. Final report for the period 1 August 1984 - 31 July 1986.** Ravnik, M. Institut Jozef Stefan, Ljubljana (Yugoslavia); International Atomic Energy Agency, Vienna (Austria). Nov 1988. 103p. (IJS-DP–5041). Order Number DE89618248/JAW. Available from NTIS (US Sales Only), PC A06/MF A01 - OSTI;INIS.

The most important properties of mixed cores are treated for TRIGA MARK II reactor, composed of standard (20% enriched, 8.5w% U content) and FLIP (70% enriched, 8.5w% U content) fuel elements. Large difference in enrichment and presence of burnable poison in FLIP fuel have strong influence on the main core characteristics, such as: fuel temperature coefficient, power defect, Xe and Sm worth, power and flux distributions, etc. They are significantly different for both types of fuel. Optimal loading of mixed cores therefore strongly depends on the loading pattern of both types of fuel elements. Results of systematic calculational analysis of mixed cores are presented. Calculations on the level of fuel element are performed with WIMSD-4 computer code with extended cross-section library. Core calculations are performed with TRIGAP two-group 1-D diffusion code. Results are compared to measurements and physical explanation is provided. Special concern is devoted to realistic mixed cores, for which optimal in-core fuel management is derived. Refs, figs and tabs.

36116 (INIS-mf–11446) **Symposium on HIFAR - construction and initial operation.** Australian Nuclear Association, Sutherland (Australia). 1988. 88p. (CONF-8803221–: Symposium on HIFAR - construction and initial operation, Lucas Heights, Australia, 11 Mar 1988). Order Number DE89620265/JAW. Available from NTIS (US Sales Only), PC A05/MF A01 - OSTI; INIS.

Co-sponsored by the Australian Institute of Nuclear Science and Engineering and the Lucas Heights Scientific Society.

The construction of the HIFAR reactor at Lucas Heights and its early operational history is the subject of these papers which were presented at a symposium to mark the 30th year of HIFAR operation.

36117 (INIS-mf–11446, pp. 12) **HIFAR - project organization design and procurement.** Carr, F.H. Australian Nuclear Association, Sutherland (Australia). 1988. (CONF-8803221–: Symposium on HIFAR - construction and initial operation, Lucas Heights, Australia, 11 Mar 1988). In *Symposium on HIFAR - construction and initial operation.* Order Number DE89620265/JAW. Available from NTIS (US Sales Only), PC A05/MF A01 - OSTI; INIS.

Co-sponsored by the Australian Institute Nuclear Science and Engineering and the Lucas Heights Scientific Society.

The HIFAR reactor and its associated buildings were constructed in a period of two years and seven months, from the date of placing the order in the United Kingdom on the 27 June 1955, to when the reactor was made critical on 26 January 1958. The reactor has operated very satisfactorily in the subsequent thirty year period with its major components intact, and no doubt will continue its safe operation for a number of years to come. The construction of HIFAR was an engineering project undertaken by staff of the AAEC in cooperation with the United Kingdom Atomic Energy Authority (UKAEA). This paper describes the contractual procedures adopted for the supply of the reactor and its assembly; and the involvement of the UKAEA, the main contractor Head Wrightson Processes Ltd., and the staff of the AAEC in the design and procurement of the components for the reactor in the UK.

36118 (INIS-mf–11446, pp. 11) **HIFAR : aspects of construction - United Kingdom and Australia.** Cooke, K.J. Australian Nuclear Association, Sutherland (Australia). 1988. (CONF-8803221–: Symposium on HIFAR - construction and initial operation, Lucas Heights, Australia, 11 Mar 1988). In *Symposium on HIFAR - construction and initial operation.* Order Number DE89620265/JAW. Available from NTIS (US Sales Only), PC A05/MF A01 - OSTI; INIS.

Co-sponsored by the Australian Institute Nuclear Science and Engineering and the Lucas Heights Scientific Society.

This paper discusses aspects of the project management organisation for the construction of the HIFAR research reactor at Lucas Heights. The project was executed from initial contract letting to reactor criticality in less than three years.

36119 (INIS-mf–11446, pp. 17) **Some aspects of HIFAR design.** Carlson, R.W.S. (Australian Nuclear Science and Technology Organisation, Lucas Heights (Australia)); Ebeling, D.R. Australian Nuclear Association, Sutherland (Australia). 1988. (CONF-8803221–: Symposium on HIFAR - construction and initial operation, Lucas Heights, Australia, 11 Mar 1988). In *Symposium on HIFAR - construction and initial operation.* Order Number DE89620265/JAW. Available from NTIS (US Sales Only), PC A05/MF A01 - OSTI; INIS.

Co-sponsored by the Australian Institute Nuclear Science and Engineering and the Lucas Heights Scientific Society.

Some aspects of the HIFAR design and reasons for departing in a few areas from the original DIDO design are described. The HIFAR reactor was able to take advantage of the early operation of DIDO to incorporate some changes before construction had advanced too far.

36120 (INIS-mf–11446, pp. 4) **Instrumentation and control aspects of HIFAR.** Parry, J. Australian Nuclear Association, Sutherland (Australia). 1988. (CONF-8803221–: Symposium on HIFAR - construction and initial operation, Lucas Heights, Australia, 11 Mar 1988). In *Symposium on HIFAR - construction and initial operation.* Order Number DE89620265/JAW. Available from NTIS (US Sales Only), PC A05/MF A01 - OSTI; INIS.

Co-sponsored by the Australian Institute Nuclear Science and Engineering and the Lucas Heights Scientific Society.

It is not possible in a brief review to describe the instrument configuration of HIFAR in detail. The purpose of these notes and the associated discussion is to give some of the historical background to the construction project, to indicate modifications necessary for early low power operation and to offer some comments on the design philosophies of the times.

36121 (INIS-mf–11446, pp. 7) **HIFAR commissioning and operation 1955-1962.** Tingate, G.A. Australian Nuclear Association, Sutherland (Australia). 1988. Co-sponsored by the Australian Institute Nuclear Science and Engineering and the Lucas Heights Scientific Society.

The ANSTO plan of December 1987 defines the corporate environment of HIFAR. Amongst other things, the plan emphasised HIFAR as a key national facility, and identified HIFAR operations and facility upgrading as activities within an outward looking nuclear technology program. This paper outlines the present operation of HIFAR within that program.

36123 (NSB-QRM–1) **First quarterly report of the Nuclear Safety Bureau for the period 19 October 1987 to 18 January 1988.** Australian Nuclear Science and Technology Organisation, Lucas Heights (Australia). Nuclear Safety Bureau. Jan 1988. 9p. Order Number DE89618249/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

Section 25 of the Australian Nuclear Science and Technology Organisation (ANSTO) Act 1987 requires the Board of ANSTO to appoint a Nuclear Safety Bureau which is responsible for monitoring and reviewing the safety of any nuclear plant operated by ANSTO. This first report covers the revision of the authorisation for operation of the HIFAR reactor at Lucas Heights. It reports that there were 8 unusual operating events in the three month period ending 31 December 1987, none of which were categorised as abnormal occurrences. Reports are presented dealing with maintenance, periodic inspection and testing, the HIFAR emergency control room, the HIFAR polar crane, seismic resistance of HIFAR, replacement of the HIFAR electrical power supply system, the reactor MOATA and nuclear safety aspects of reactor fuel storage.

36124 (NSB-QRM–2) **Second quarterly report of the Nuclear Safety Bureau for the period 19 January 1988 to 18 April 1988.** Australian Nuclear Science and Technology Organisation, Lucas Heights (Australia). Nuclear Safety Bureau. Apr 1988. 5p. Order Number DE89618250/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

The Nuclear Safety Bureau is responsible for monitoring and reviewing the safety of any nuclear plant operated by the Australian Nuclear Science and Technology Organisation (ANSTO). The report covers operation of the HIFAR and MOATA reactors at Lucas Heights, including unusual operating events, maintenance, periodic testing, inspection, HIFAR safety documentation, shift staffing, audit of HIFAR staff training and the emergency control room, HIFAR modifications, nuclear safety aspects of reactor fuel storage and the subcritical assembly.

36125 (ORNL/TM–11188) **Bulk Shielding Facility quarterly report, January, February, and March 1989.** Laughlin, D.L.; Hamrick, T.P. Oak Ridge National Lab., TN (USA). May 1989. 15p. Sponsored by DOE Nuclear Energy. DOE Contract AC05-84OR21400. Order Number DE89013757/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This document discusses activities at the Bulk Shielding Facility during this reporting period. The Bulk Shielding Reactor (BSR) remained shut down during January, February, and March. Water-quality control in both the reactor primary and secondary cooling systems was satisfactory. The Pool Critical Assembly (PCA) is shut down for shim-safety rod magnets and associated electronic components upgrading.

36126 (DP-MS–88-143-Rev.1) **Life extension approach to the reactor vessel of a nuclear production reactor: Revision 1.** Sindelar, R.L.; Awadalla, N.G.; Baumann, N.P.; Mehta, H.S. Savannah River Lab., Aiken, SC (USA). 1989. 25p. Sponsored by DOE

Nuclear Energy. DOE Contract AC09-76SR00001. (CONF-890721–10-Rev.1: Joint ASME/JSME pressure vessel and piping conference, Honolulu, Hawaii, USA, 23-27 Jul 1989). Order Number DE89008305/JAW. Available from NTIS, PC A03/MF A01 - OSTI.

The nuclear materials production reactors at the Savannah River Plant have been in service for over 35 years. All the primary components of the reactor system are readily accessible for repair or replacement as needed except for the reactor vessel and thermal shields. The reactor vessel of a Savannah River Plant reactor is a cylindrical tank approximately 16 feet in diameter and 14 feet high and is not pressurized except for a 5 psig helium blanket gas in addition to the hydrostatic head of the heavy water (D_2O) moderator. The vessels are made of American Iron and Steel Institute Type 304 stainless steel fabricated into cylindrical shells with four to six wrought plates per vessel, 1.27 cm (0.5-inches) thick. The shells were made up in flat in two half-sections for later rolling and welding. The vessel bottom section containing the moderator effluent nozzles was welded to the shell in a T-joint configuration. All joining was performed with multipass Metal Inert Gas (MIG) welding. The service life assessment of the reactor vessel addresses the corrosive effects of the D_2O moderator and the degradation of the vessel material properties through exposure of the vessel to neutron irradiation. Potential degradation mechanisms include radiation embrittlement, Intergranular Stress Corrosion Cracking; and Irradiation-Assisted Stress Corrosion Cracking. 15 refs., 11 figs.

36127 (INIS-SU–85, pp. 33-35) **Optimization of the spectrum for target irradiation.** Zaritskaya, T.S.; Kiselev, G.V.; Rudik, A.P. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Nuclear reactor physics and technology. Scientific-technical collection.* Order Number DE89012154/JAW. Available from NTIS (US Sales Only), PC A05/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 2.

Solution of the problem on neutron spectrum optimization in the point where a target is located in an isotope production reactor is considered. The case when the spectrum does not change in the process of irradiation is studied. It is shown that the algorithm of the optimal process general theory with parameters can be used for the problem solution. 5 refs.; 1 fig.

2208 Propulsion Reactors

36128 (BNL–41450) **Small propulsion reactor design based on particle bed reactor concept.** Ludewig, H.; Lazareth, O.; Mughabghab, S.; Perkins, K.; Powell, J.R. Brookhaven National Lab., Upton, NY (USA). 1989. 15p. Sponsored by Department of Defense. DOE Contract AC02-76CH00016. (CONF-890103–11: 6. symposium on space nuclear power systems, Albuquerque, New Mexico, USA, 9-12 Jan 1989). Order Number DE89013569/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In this paper Particle Bed Reactor (PBR) designs are discussed which use ^{233}U and ^{242m}Am as fissile materials. A constant total power of 100MW is assumed for all reactors in this study. Three broad aspects of these reactors is discussed. First, possible reactor designs are developed, second physics calculations are outlined and discussed and third mass estimates of the various candidates reactors are made. It is concluded that reactors with a specific mass of 1 kg/MW can be envisioned of ^{233}U is used and approximately a quarter of this value can be achieved if ^{242m}Am is used. If this power level is increased by increasing the power density lower specific mass values are achievable. The limit will be determined by uncertainties in the thermal-hydraulic analysis. 5 refs., 5 figs., 6 tabs.

36129 (BNL-NUREG–42727) **Development of alternate visual examination requirements for dynamic restraints (snubbers).** Reich, M.; Breidenbach, G.; Grossman, W. Brookhaven National Lab., Upton, NY (USA). 1989. 7p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC02-76CH00016. (CONF-890721–35: Joint ASME/JSME pressure vessel and piping conference, Honolulu, HI, USA, 23-27 Jul 1989). Order Number DE89014711/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Current plant technical specifications require an initial inservice visual examination of safety related equipment dynamic restraints (snubbers) to provide assurance of operability. The time to the next examination is as short as 1 month if 8 or more snubbers are found to be inoperable. Plant operators have observed that as the snubber population of a plant increases, the current plan becomes burdensome by requiring frequent shutdowns for examination of snubbers. The Nuclear Regulatory Commission (NRC) has recognized the need and has sponsored a program to develop alternate visual examination criteria which would require examinations at constant intervals such as at refueling outages. Brookhaven National Laboratories (BNL) was selected by the NRC to conduct this program. Based on the review and evaluation of the information gathered to date, and the conclusions drawn from plant visits and the Snubber Utility Group (SNUG) data base, BNL has developed an alternate statistically-based plan which provides the permissible number of inoperable snubbers for constant and twice constant visual examination intervals for various snubber population groups. 3 refs., 2 figs., 2 tabs.

36130 (CEA-DAS–539e) **International co-operation in the field of operational safety.** Dupuis, M.C. CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. d'Analyse de Surete. Oct 1988. 11p. (CONF-881014–: International European Nuclear Society/American Nuclear Society meeting on thermal reactor safety, Avignon, France, 2-7 Oct 1988). Order Number DE89776470/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

Operational safety in nuclear power plants is without doubt a field where international co-operation is in constant progress. Accounting for over 80 per cent of the 400 reactors in service throughout the world, the menber countries of the OECD Nuclear Energy Agency (NEA) are constantly striving to improve the exchange and use of the wealth of information to be gained not just from power plant accidents and incidents but from the routine operation of these facilities. The Committee on the Safety of Nuclear Installations (CSNI) helps the Steering Committee for Nuclear Energy to meet the NEA's objectives in the safety field, namely: - to promote co-operation between the safety bodies of member countries - to contribute to the safety and regulation of nuclear activities. The CSNI relies on the technical back-up of several different working groups made up of experts appointed by the member countries. For the past three years I have had the honour of chairing Principal Working Group 1 (PWG 1), which deals with operating experience and human factor. It is in this capacity that I will attempt to outline the group's various activities and its findings illustrated by a few examples.

36131 (CEA-DAS–562) **Some aspects of the research and development programmes on the behaviour of containments during severe accidents.** Dufresne, J. CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. d'Analyse de Surete. Jan 1989. 12p. (CONF-8810375–: Reunion de l'AIEA sur le comportement ultime des enceintes, Moscou, USSR, 17-21 Oct 1988). Order Number DE89776469/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The R and D programmes relating to the behaviour of containments during severe accidents cover several domains: .leaktightness of the containment: this programme concerns the mechanical resistance of the concretes and the cracking criteria, on the one hand, and the leak rate through the porosities or cracks, on the other; . gaseous releases inside the containment. In addition to the releases of steam and fission products from the primary circuit, the gaseous H_20 and $C0_2$ releases from the concrete must also be studied: firstly during the corium-concrete interaction, and secondly during the heating of the internal surface of the containment which can be raised to a high temperature on contact with the atmosphere, for example during hydrogen combustion; . the release of fission products during the corium-concrete interactions; . the behaviour of the fission products inside the containment, particularly as regards iodine.

36132 (CNEN-DR-GAPS-RA–01/88) **Use of source term code package in the ELEBRA MX-850 system.** Guimaraes, A.C.F.; Goes, A.G.A. Comissao Nacional de Energia Nuclear, Rio de Janeiro, RJ (Brazil). Dec 1988. 110p. (In Portuguese). Order Number DE89620445/JAW. Available from NTIS (US Sales Only), PC A06/MF A01 - OSTI; INIS.

The implantation of source term code package in the ELEBRA-MX850 system is presented. The source term is formed when radioactive materials generated in nuclear fuel leakage toward containment and the external environment to reactor containment. The implantated version in the ELEBRA system are composed of five codes: MARCH 3, TRAPMELT 3, THCCA, VANESA and NAVA. The original example case was used. The example consists of a small loca accident in a PWR type reactor. A sensitivity study for the TRAPMELT 3 code was carried out, modifying the 'TIME STEP' to estimate the processing time of CPU for executing the original example case. (M.C.K.).

36133 (CONF-890470– II.A.1.1-II.A.1.11) **Research in operations: operator reliability experiments.** Worledge, D.H. (Electric Power Research Institute, Palo Alto, CA (USA)); Joksimovich, V.; Spurgin, A.J. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

The purpose of the EPRI Operator Reliability Experiments (ORE) Project is to collect data for use in reliability and safety studies of nuclear power plant operation which realistically take credit for operator performance in preventing core damage. Three objectives of this work are: (1) to develop a data collection and analysis procedure; (2) to obtain quantitative and qualitative data on operating crew performance in the control room for potential accident sequences using plant simulators; and (3) to test the Human Cognitive Reliability (HCR) correlation.

36134 (CONF-890470– II.A.2.1-II.A.2.18) **Research in operations: lessons learned.** Molden, J.E. (Pacific Gas and Electric, CA (USA)). Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

Over the past several years, increased attention has been focused on control room resource management. Although the need has arisen from a variety of circumstances, the mission has always been clear. The industry must both pursue new methods and continue with existing approaches which will provide measurable improvements in the control room team performance. A key factor in succeeding is the ability to quantify acceptable performance. Once this is achieved, changes needed to make improvements will be better understood. The purpose of this paper is to discuss an Electric Power Research Institute (EPRI) project that Diable Canyon has been involved in which has already resulted in improved team performance.

36135 (CONF-890470– III.B.5.1-III.B.5.6) **Developing a systematic approach to team training for emergency response personnel.** Derrer, Y.E. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

Preparing a group of station employees with diverse expertise and backgrounds to work together as a team during an emergency is a challenge. One that is best addressed by a systematic approach to team training. To provide more effective training the Washington Public Power Supply System's Technical Training Department conducted a job and task analysis. Based on the results the Supply System redeveloped initial training, using a center based concept. This system provided a method to train individuals from different disciplines as a team. To avoid simple repetition of initial concepts and to culture the team approach, a center based continuing training program was developed which focused on the previous year's major exercise scenario. This system allowed all center members the opportunity to interact with each other as a team, learn from any deficiencies identified during the previous year and provide input to enhance center operations. This systematic approach has been accepted by the participants with a positive attitude, has led to closer teamwork and has reduced the number of deficiency findings.

36136 (CONF-890470– IV.A.2.1-IV.A.2.13) **Changing organizational cultures - creating quality achievers through training and teamwork.** Widen, W.C.; Cowell, T.H. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

The author notes several examples of disastrous and near-disastrous occurrences within the chemical, aviation, and nuclear industries to illustrate his discussion of the following topics: man-machine interface: the growing battle of automation complacency; creating quality achievers: a complex issue of changing organizational cultures; creating organizational change through training and teamwork; enhancing professionalism through training: the conduct of operations program; and lessons learned. Specific communications recommendations are given.

36137 (CONF-890470– IV.A.5.1-IV.A.5.18) **Systematic problem solving process (SPSP) - root cause analysis that works.** Kubenka, J.H. (Houston Lighting and Power, TX (USA)). Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

In January, 1988, the South Texas Project Nuclear Training Department began to research a methodology for root cause analysis in response to a Nuclear Safety Review Board (NSRB) request. As a result, the Systematic Problem Solving Process (SPSP) was developed to provide a simple methodology which encompasses all elements needed to perform a competent and thorough problem analysis and to project valid solutions to those problems. The SPSP assumes that errors which result in undesirable events (problems) will be made in a sequence of actions during some work activity. It assumes that the errors will be made by very capable, carefully selected, trained and qualified people who are strongly biased against making errors that have undesirable or dangerous effects. The process also assumes that the organizational system is at fault more often than the individual and tries to find out how the system failed the individual rather than how the individual failed the system. The SPSP training course describes and provides practical exercises in the thought processes and techniques used by experienced accident and incident investigators. The course provides a potential investigator with a tool box which contains all the necessary tools to deal with problems both simple and complex. The course also provides instruction on how to use each of the tools individually and in conjunction with each other to effect reasonable solutions to problems encountered. The techniques are specifically applicable to the nuclear power plant environment and its organization.

36138 (CONF-890470– IV.B.1.1-IV.B.1.8) **Personnel development program (an enhancement to GET).** Patrilla, V. (Iowa Electric Light and Power Co., Cedar Rapids (USA)); Holden, W.A. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

Cooperation, common sense, and training together helped lower the error rate at the Duane Arnold Energy Center. One training activity, procedural awareness training, has been made a badging requirement. Its use is correlated with a significantly reduced rate of certain errors. Iowa Electric Light and Power believes the effectiveness of this class is based on its continually evolving content. The content of the class is defined by the plant supervisors and current site or industry concerns.

36139 (CONF-890470– IV.B.3.1-IV.B.3.16) **Annual critique: an effective program evaluation tool.** Wall, T.J.; McKenzie, L.J. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium

on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

Accreditation by the Institute of Nuclear Power Operations (INPO), indicates a Utility has made a formal commitment to a systematic approach to training. Duke Power Company had implemented INPOs Training System Development (TSD) model to achieve accreditation of its programs in 1986. The last phase of the five step model includes a systematic evaluation of the effectiveness of the training program. This evaluation relies on data collected from the client group, and the training group's ability to respond and affect needed changes to the training program. This paper will discuss using an annual critique to accomplish specialization of on-the-job (OJT) training requirements for the Health Physics discipline at Duke Power Company. The discussion details the feedback process that lead to specialization, the process involved to get changes made, and the cost savings and results of implementing these changes. The paper also addresses the client-training group relationship that created the ability to make this happen.

36140 (CONF-890470– V.B.3.1-V.B.3.29) **Role of environmental qualification training in nuclear plant maintenance.** Krantz, G.W. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

For the next two and one-half decades, the operation of the 111 completed and the nearly completed or near-term operating license (NTOL) plants will predominate. Already, however, there is a rush on extension of life, Nuplex (Nuclear Plant life Extension), of their newly operational plants. Since nuclear safety is paramount, however, they can neither dismiss nor omit the need for the very highest caliber maintenance on that segment of their nuclear plants involved in shutting down the plant and in maintaining safe shutdown in the case of a serious design basis accident. Although the redundant, safety-related, shutdown equipment receives no fanfare for megawatts generated or revenue produced, the equipment must receive the limelight of attention in the ongoing maintenance program throughout the life of the plant. The equipment is required by the NRC to receive special attention from design, through manufacturing, procurement, storage, installation, operation, testing and most importantly - maintenance. This paper deals with the required installation of this equipment in harsh plant environments, the importance placed on maintenance of the equipment, and of the role of training in the maintenance activities.

36141 (CONF-890470– V.B.5.1-V.B.5.12) **Radiation monitoring training system - an aid to performance-based training.** Boudreaux, C.L. Oak Ridge National Lab., TN (USA). Apr 1989. From 8. symposium on training of nuclear facility personnel; Gatlinburg, TN, USA; 23-27 Apr 1989. In *Proceedings of the eight symposium on training of nuclear facility personnel.* Order Number DE89010164/JAW. Available from NTIS, PC A99/MF A01.

This paper covers the use of Waterford-3 plant-specific equipment used for hands-on training of plant personnel. Specifically, the Radiation Monitoring Training System is discussed; however, the application applies to any component or system utilized to support a performance-based training program.

36142 (CONF-890721–31) **A method for three-dimensional structural analysis of reinforced concrete containment.** Kulak, R.F.; Fiala, C. Argonne National Lab., IL (USA). 1989. 10p. Sponsored by DOE Nuclear Energy. DOE Contract W-31109-ENG-38. From Joint ASME/JSME pressure vessel and piping conference; Honolulu, Hawaii, USA; 23-27 Jul 1989. Order Number DE89013306/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A finite element method designed to assist reactor safety analysts in the three-dimensional numerical simulation of reinforced concrete containments to normal and off-normal mechanical loadings is presented. The development of a lined reinforced concrete plate element is described in detail, and the implementation of an empirical transverse shear failure criteria is discussed. The method is applied to the analysis of a 1/6th scale reinforced concrete containment model subjected to static internal pressurization. 11 refs., 14 figs., 1 tab.

36143 (CONF-890721–32) **Comparison of analysis and vibration test results for a multiple supported piping system.** Hsieh, B.J.; Kot, C.A.; Srinivasan, M.G. Argonne National Lab., IL (USA). 1989. 38p. Sponsored by Nuclear Regulatory Commission. DOE Contract W-31109-ENG-38. From Joint ASME/JSME pressure vessel and piping conference; Honolulu, Hawaii, USA; 23-27 Jul 1989. Order Number DE89013191/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The behavior of a nuclear power plant piping system subjected to high level vibrational excitation is investigated experimentally and analytically. The objective is to evaluate the piping analysis method employed in the SMACS computer code. Experimental data are obtained from the Large Shaker Experiments (SHAG) conducted at the HDR Test Facility in Kahl/Main, FRG, in which the dynamic behavior of an in-plant piping system with various support configurations was investigated. Comparisons of calculational results with measured data indicate that the adequacy of the prediction depends primarily on the modeling of boundary conditions and dynamic supports. Treating the latter as rigid and using building motion as input, in general, results in under prediction of piping response. On the other hand when accelerations on the pipe side of the dynamic support attachment are used as input, piping response is highly overpredicted. Also modeling wall/floor component attachments as fixed usually leads to underprediction of amplitude as well as differences in the frequency content of response. 9 refs., 18 figs., 1 tab.

36144 (EGG-M–88406) **Results of the initial phase of the INEL/USNRC large bore hydraulic snubber reliability evaluation program.** Ware, A.G.; Nitzel, M.E.; Rahl, T.E.; Edson, J.L.; Page, J.D. EG and G Idaho, Inc., Idaho Falls, ID (USA). 1989. 10p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC07-76ID01570. (CONF-890721–28: Joint ASME/JSME pressure vessel and piping conference, Honolulu, Hawaii, USA, 23-27 Jul 1989). Order Number DE89011131/JAW. Available from NTIS, PC A02/MF A01 - OSTI.

The reliability of large bore hydraulic snubbers (LBHSs) is a present safety concern in nuclear power plants. LBHSs are used primarily to restrain large components such as steam generators and reactor coolant pumps during seismic events. Initially there were no test machines capable of testing LBHSs for functionality, so they were exempted from surveillance testing prior to 1980. When LBHSs were later tested, numerous deficiencies, many of which would render the LBHSs inoperable, were found. This paper describes the initial phase of the INEL/USNRC LBHS research program whose objective is to assess the need to improve the reliability of LBHSs and to determine what, if any, requirements should be implemented to achieve necessary improvements. The program has assessed the current state of LBHSs, including types and locations of snubbers in plants, operational and maintenance requirements, current in-service inspection tests, and the availability of state-of-the-art testing equipment. Operating experience data, including information contained in the Nuclear Plant Reliability Data System and Licensee Event Reports, have been summarized to determine the modes of snubber failure. 15 refs., 11 figs., 1 tab.

36145 (GAO/NSIAD–88-131BR) **Nuclear power safety.** General Accounting Office, Washington, DC (USA). National Security and International Affairs Div. 1988. 38p. Available from General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

The International Atomic Energy Agency, the organization concerned with worldwide nuclear safety has produced two international conventions to provide (1) prompt notification of nuclear accidents and (2) procedures to facilitate mutual assistance during an emergency. IAEA has also expanded operational safety review team missions, enhanced information exchange on operational safety events at nuclear power plants, and planned a review of its nuclear safety standards to ensure that they include the lessons learned from the Chernobyl nuclear plant accident. However, there appears to be a nearly unanimous belief among IAEA members that may attempt to impose international safety standards verified by an international inspection program would infringe on national sovereignty. Although several Western European countries have proposed establishing binding safety standards and inspections, no

specific plant have been made; IAEA's member states are unlikely to adopt such standards and an inspection program.

36146 (GAO/RCED-88-73) **Nuclear regulation.** General Accounting Office, Washington, DC (USA). Resources, Community and Economic Development Div. 1988. 40p. Available from General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

In December 1986, a pipe rupture at Virginia Electric and Power Company's Surry Unit 2 nuclear power plant injured eight workers; four subsequently died. In July 1987, widespread pipe deterioration was discovered at General Electric's Trojan plant in Oregon. These events raise questions about the long-term safety of pipe systems in nuclear power plants. The Nuclear Regulatory Commision has now required utilities to provide information on the extend of known pipe deterioration at each plant. As of January 1988, NRC staff identified 34 new and mature plants with erosion/corrosion damage. It expects to gather additional information and use it to determine whether specific regulatory action is needed. In addition, a utility industry group has developed a program to help companies detect and repair pipe damage.

36147 (IAEA-TECDOC-503) **Reviewing surveillance activities in nuclear power plants. Supplementary guidance and reference material for IAEA Operational Safety Review Teams (OSARTs).** International Atomic Energy Agency, Vienna (Austria). Mar 1989. 143p. Order Number DE89620240/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

This document provides guidance to Operational Safety Review Teams (OSARTs) for reviewing surveillance activities at a nuclear power plant. In addition, the document contains reference material to support the review of surveillance activities, to assist within the Technical Support area and to ensure consistency between individual reviews. Drafts of the document have already been used on several OSART missions and found to be useful. The document first considers the objectives of an excellent surveillance programme. Investigations to determine the quality of the surveillance programme are then discussed. The attributes of an excellent surveillance programme are listed. Advice follows on how to phrase questions so as to obtain an informative response on surveillance features. Finally, specific equipment is mentioned that should be considered when reviewing functional tests. Four annexes provide examples drawn from operating nuclear power plants. They were selected to supplement the main text of the document with the best international practices as found in OSART reviews. They should in no way limit the acceptance and development of alternative approaches that lead to equivalent or better results. Refs, figs and tabs.

36148 (INIS-mf-11446, pp. 13) **HIFAR refurbishing program.** Allen, M.R. (Australian Nuclear Science and Technology Organisation, Lucas Heights (Australia)). Australian Nuclear Association, Sutherland (Australia). 1988. (CONF-8803221-: Symposium on HIFAR - construction and initial operation, Lucas Heights, Australia, 11 Mar 1988). In *Symposium on HIFAR - construction and initial operation.* Order Number DE89620265/JAW. Available from NTIS (US Sales Only), PC A05/MF A01 - OSTI; INIS.

Co-sponsored by the Australian Institute Nuclear Science and Engineering and the Lucas Heights Scientific Society.

The refurbishing program was originally planned in 1982 to cover a five year period and in view of the limited development of the proposals at this date the progress has been satisfactory. The inclusion of the Cooling Towers and Data Acquisition System in the program has had the effect of extending the required funding and timescale of the program. The investigations of reactor systems which are important to safety have shown that HIFAR does not have significant deficiencies with respect to the basic plant design features with the possible exception of the Electrical Power Supply System and seismic resistance. The radiological consequences of rare event reactor accidents resulting from in-plant causes have been examined for the existing plant and found to be well within the limits of the safety criteria. However, the reactor does contain old equipment in safety related plant and an on-going program of plant monitoring and replacement is essential if HIFAR is to maintain the current safety status, although at a lower level of activity than is current for this refurbishing program.

36149 (INIS-mf-11940) **Reactor safety research results and perspectives.** Banaschik, M. Gesellschaft fuer Reaktorsicherheit m.b.H. (GRS), Koeln (Germany, F.R.). 1988. 14p. (In German). (CONF-881131-: Society for Reactor Safety meeting on research to increase the safety of nuclear power plants, Cologne, Germany, F.R., 3-4 Nov 1988). Order Number DE89788197/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The reactor safety research activities cover many and extensive experiments and the development of theoretical models for verification of the design requirements. The results achieved so far bring in significant information on the safety margins of nuclear installations and their systems, and on potential enhancements of engineered safety. Further activities and developments will be directed towards the design-exceeding incident scenarios, in order to find out appropriate preventive measures and techniques, based on the safety potentials inherent in the conservative design of the operating and safety systems. The R and D activities are intended to yield accident management tools capable of bringing back a plant to safe operating conditions even after a severe accident. This is to be achieved by exploiting the safety margins and using also the operating systems for accident management. Hence the R and D work investigates operating processes and plant-specific conditions. There is a good exchange of experience and knowledge in this field on an international level, due to the great public interest in best possible safety of the peaceful utilization of nuclear energy in any country of the world.

36150 (INIS-mf-11941) **Perspectives of expert systems for nuclear reactor safety.** Bastl, W. Gesellschaft fuer Reaktorsicherheit m.b.H. (GRS), Koeln (Germany, F.R.). 1988. 19p. (In German). (CONF-881131-: Society for Reactor Safety meeting on research to increase the safety of nuclear power plants, Cologne, Germany, F.R., 3-4 Nov 1988). Order Number DE89788198/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

There is a wide range of possible expert system applications in the field of nuclear reactor safety: - in the safety-oriented design review of reactor systems, here particularly for subsequent modifications indicated by operating experience; - for safety analyses, (nuclear plant analyser, fault free analysis); - for operational safety engineering including accident management (diagnostic systems); - for maintenance and training purposes. The potentials of expert systems are based on the following factors: storage of information in the knowledge base, efficient use of extensive data bases, intensive interactive mode operation, rapid development of prototypes.

36151 (INIS-mf-11942) **Large-scale experiments and their significance for development and verification of thermal hydraulics computer codes.** Wolfert, K.; Riegel, B.; Sonnenburg, H.G. Gesellschaft fuer Reaktorsicherheit m.b.H. (GRS), Koeln (Germany, F.R.). 1988. 27p. (In German). (CONF-881131-: Society for Reactor Safety meeting on research to increase the safety of nuclear power plants, Cologne, Germany, F.R., 3-4 Nov 1988). Order Number DE89788199/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

Large scale experiments cover single-effect experiments in a 1:1 scale reactor component mockup facility, and integral experiments in a mockup of the primary and secondary circuit. The single-effect experiments form the basis of a purposeful development and verification of models describing larger range process phenomena to be expected in operation of reactor installations, and integral experiments allow a verification of the interaction of the various single models. The systematic testing procedure set up for development and verification yields a realistic description of the physical phenomena occurring in a reactor facility and allows extensive and comprehensive verification of the entire programme.

36152 (INIS-mf-11943) **ATHLET - an advanced system code for the analysis of thermohydraulic processes.** Teschendorff, V.; Miro, J.; Lerchl, G. Gesellschaft fuer Reaktorsicherheit m.b.H. (GRS), Koeln (Germany, F.R.). 1988. 19p. (In German). (CONF-881131-: Society for Reactor Safety meeting on research to increase the safety of nuclear power plants, Cologne, Germany, F.R., 3-4 Nov 1988). Order Number DE89788200/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The ATHLET computer code is being developed by GRS in order to be able to treat and model LOCA and transient conditions in a

PWR or BWR with just one computer code instead of the hitherto three codes available that are written for different applications. The tasks to be performed cover description of design-exceeding accidents and core meltdown accidents, which are to be calculated and simulated as realistic as possible in order to avoid errors and faulty assessments. For modelling of accidents with core disruption, a code ATHLET-SA ist being developed in cooperation with the IKE. This version also includes models of core meltdown and fission product behaviour. The ATHLET code is intended as a code with uniform program structure covering various models differing in detail treatment. Data input is user friendly and allows visual checking of program input for the plant geometry data by means of a graphic display.

36153 (INIS-mf–11944) **Nuclear plant analyser, a tool for evaluating actions of accident management.** Beraha, D.; Lerchl, G.; Voggenberger, T. Gesellschaft fuer Reaktorsicherheit m.b.H. (GRS), Koeln (Germany, F.R.). 1988. 21p. (In German). (CONF-881131–: Society for Reactor Safety meeting on research to increase the safety of nuclear power plants, Cologne, Germany, F.R., 3-4 Nov 1988). Order Number DE89788201/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The nuclear plant analyser currently developed by GRS and Siemens/KWU allows to use detailed models as well as fast and simple models. The thermofluid codes TRAC and ATHLET are used as process models. Both codes are capable of modelling the effects of accident management actions on the course of events on the 'prevention' level. An extension to the 'mitigation' level is possible by combination with the ATHLET-SA version. The analyser allows extensive simulation of thermohydraulic stand by systems and monitoring and safety systems of a plant in order to obtain a realistic verification of preventive actions and their effects by a description of plant behaviour as exact as possible.

36154 (INIS-SU–85, pp. 74-78) **Method for calculating hydrogen propagation accidents in NPP compartments under accidents.** Budaev, M.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Nuclear reactor physics and technology. Scientific-technical collection.* Order Number DE89012154/JAW. Available from NTIS (US Sales Only), PC A05/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki 231Fizika i metody rascheta yadernykh reaktorov.; no. 2.

A mathematical model and the PROBL-2 the computer code are described, which allows to calculate parameters of containment atmosphere during accidents with respect to hydrogen propagation. 8 refs.; 2 figs.

36155 (INIS-XN–182) **Nuclear Accidents Intervention Levels for Protection of the Public.** Nuclear Energy Agency, 75 - Paris (France). 1989. 97p. Order Number DE89619908/JAW. Available from NTIS (US Sales Only), PC A05/MF A01 - OSTI; INIS.

The impact of the 1986 Chernobyl accident called attention to the need to improve international harmonization of the principles and criteria for the protection of the public in the event of a nuclear accident. This report provides observations and guidance related to the harmonization of radiological protection criteria, and is intended to be of use to national authorities and international organizations examining the issue of emergency response planning and intervention levels.

36156 (JAERI-M–88-271) **Break location effects on PWR small break LOCA phenomena. Inadequate core cooling in lower plenum break test at LSTF.** Suzuki, Mitsuhiro. Japan Atomic Energy Research Inst., Tokyo (Japan). Jan 1989. 208p. Order Number DE89790899/JAW. Available from NTIS (US Sales Only), PC A10/MF A01.

The report presents experimental results of a small lower plenum break test of SB-PV-01 conducted at the large-Scale Test Facility (LSTF) of the Rig-of-Safety Assessment (ROSA)-IV program. This test simulates a loss-of-coolant accident (LOCA) caused by instrument tubes break (break area corresponds to 0.5% of the cold leg flow area) in a Westinghouse-type pressurized water reactor (PWR) assuming both manual actuation for all of the high pressure injection (HPI) systems and failure of the auxiliary feedwater systems. The report clarifies long-term system responses, especially the core cooling conditions related to the primary mass inventory. Also it clarifies break location effects on small break LOCA phenomena by comparing other five similar LOCA tests with break locations at cold leg, hot leg, upper head, pressurizer top (TMI-type) and SG U-tubes. It is coucluded that the lower plenum break is the severest on core heatup due to the highest break flow rate and the least primary mass recovery after the ECCS among the six tests.

36157 (Juel-Spez–477) **On the accident behaviour of the HTR-100. A risk-oriented analysis.** Bongartz, R.; Degen, G.; Hennings, W.; Marx, J.; Mertens, J.; David, P.H.; Jahn, W.; Meister, G.; Rehm, W.; Wolters, J. Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Nukleare Sicherheitsforschung. Dec 1988. 114p. (In German). Order Number DE89788400/JAW. Available from NTIS (US Sales Only), PC A06/MF A01.

The safety concept was analysed with respect to its balance, and the radiological risk was classified and quantified. Transients, leaks at the primary circuit, leaks at the steam generator and earthquakes were taken into account as initiating events. The analysis was performed in close interrelation with the planning process and provided indications of improvements to the accident control concept. Accidents involving loss of afterheat removal only contribute insignificantly to the radiological risk of the HTR-100 since cooling of the fuel elements sufficing to retain fission products is largely self-supporting. Essential contributions are made, on the other hand, by sequences initiated by a leak in a heating tube of the steam generator; its operational plate out activity may in part be released into the environment, possibly accompanied by fission gases from defective fuel particles. Leaks at the primary circuit are of comparable relevance; their radiological source term is significantly lower, but their frequency is higher. The risk contribution possibly caused by earthquakes proved to be negligible. In all cases emissions are so small that calculations of accident consequences do not reveal any lethal doses and practically no stochastic case of death due to cancer, and this without any immediate protection measures, long-term resettlement or decontamination. The integral risk of late fatalities is in the order of 10^{-7} per plant year; a number of sufficiently rare accident sequences provide contributions of the same order of magnitude. The doses from sequences possibly to be defined as design basis accidents remain far below the corresponding accident planning values.

36158 (LA-UR–89-1178) **Safety testing program for the Galileo mission radioisotope thermoelectric generator.** Cull, T.A. Los Alamos National Lab., NM (USA). 1989. 15p. Sponsored by DOE Nuclear Energy. DOE Contract W-7405-ENG-36. (CONF-890780–1: 9. international system safety conference, Long Beach, California, USA, 17-20 Jul 1989). Order Number DE89011192/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The major design requirement for any space nuclear power system is to minimize the potential for interaction of the radioactive materials with Earth's population and environment. All previous space power systems were launched on expendable launch vehicles (ELVs), so the design emphasis for the GPHS was on surviving the most severe ELV accident environments (launch pad explosion and solid propellant fire) and on surviving accident environments resulting from spacecraft failure (reentry and land impact). 14 refs., 4 figs., 2 tabs.

36159 (NUREG/CR–3469-Vol.4) **Occupational dose reduction at nuclear power plants: Annotated bibliography of selected readings in radiation protection and ALARA: Volume 4.** Khan, T.A.; Baum, J.W. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Regulatory Applications; Brookhaven National Lab., Upton, NY (USA). Jun 1989. 121p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC02-76CH00016. (BNL-NUREG–51708-Vol.4). Available from NTIS, PC A06/MF A01 - GPO - OSTI.

This report is the fourth in the series of bibliographies supporting the efforts at the Brookhaven National Laboratory on dose reduction at nuclear power plants. Abstracts for this bibliography were selected from proceedings of technical meetings, journals, research

reports and searches of the DOE's Energy Data Base. The abstracts included in this report to operational health physics as well as other subjects which have a bearing on dose reduction at nuclear power plants, such as stress corrosion, cracking, plant chemistry, use of robotics and remote devices, etc. Material on improved design, materials selection, planning and other topics which are related to dose reduction efforts are also included. The report contains 327 abstracts as well as subject and author indices. All information in the current volume is also available from the ALARA Center's bulletin board service which is accessible by personal computers with the help of a modem. The last section of the report explains the features of the bulletin board. The bulletin board will be kept up-to-date with new information and should be of help in keeping people current in the area of dose reduction.

36160 (NUREG/CR–4409-Vol.3) **Data base on dose reduction research projects for nuclear power plants: Volume 3.** Khan, T.A.; Baum, J.W. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Regulatory Applications; Brookhaven National Lab., Upton, NY (USA). May 1989. 181p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC02-76CH00016. (BNL-NUREG–51934-Vol.3). Available from NTIS, PC A08/MF A01 - GPO - OSTI.

This is the third volume in a series of reports that provide information on dose-reduction research and health physics technology for nuclear power plants. The information is taken from data base maintained by Brookhaven National Laboratory's ALARA Center for the Nuclear Regulatory Commission. This report presents information on 80 new projects, covering a wide area of activities. Projects on steam generator degradation, decontamination, robotics, improvement in reactor materials, and inspection techniques, among others, are described in the research section. The section on health physics technology includes some simple and very cost-effective projects to reduce radiation exposures. Collective dose data from the United States and other countries are also presented. In the conclusion, we suggest that although new advanced reactor design technology will eventually reduce radiation exposures at nuclear power plants to levels below serious concern, in the interim an aggressive approach to dose reduction remains necessary. 20 refs.

36161 (NUREG/CR–4961) **A summary of hydrogen-air detonation experiments.** Guirao, C.M.; Knystautas, R.; Lee, J.H. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Systems Research; Sandia National Labs., Albuquerque, NM (USA); McGill Univ., Montreal, PQ (Canada). Dept. of Mechanical Engineering. May 1989. 78p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC04-76DP00789. (SAND–87-7128). Available from NTIS, PC A05/MF A01 - GPO - OSTI.

Dynamic detonation parameters are reviewed for hydrogen-air-diluent detonations and deflagration-to-detonation transitions (DDT). These parameters include the characteristic chemical length scale, such as the detonation cell width, associated with the three-dimensional cellular structure of detonation waves, critical transmission conditions of confined detonations into unconfined environments, critical initiation energy for unconfined detonations, detonability limits, and critical conditions for DDT. The detonation cell width, which depends on hydrogen and diluent concentrations, pressure, and temperature, is an important parameter in the prediction of critical geometry-dependent conditions for the transmission of confined detonations into unconfined environments and the critical energies for the direct initiation of unconfined detonations. Detonability limits depend on both initial and boundary conditions and the limit has been defined as the onset of single head spin. Four flame propagation regimes have been identified and the criterion for DDT in a smooth tube is discussed. 108 refs., 28 figs., 5 tabs.

36162 (NUREG/CR–5227-Suppl.1) **Fitness for duty in the nuclear power industry: A review of technical issues.** Moore, C.; Barnes, V.; Hauth, J.; Wilson, R.; Fawcett-Long, J.; Toquam, J.; Baker, K.; Wieringa, D.; Olson, J.; Christensen, J. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Reactor Inspection and Safeguards; Pacific Northwest Lab., Richland, WA (USA); Battelle Human Affairs Research Center, Seattle, WA (USA). May 1989. 174p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC06-76RL01830. (PNL–6652-Suppl.1;BHARC–700/88/018-Suppl.1). Available from NTIS, PC A08/MF A01 - GPO - OSTI.

This report presents information gathered and analyzed in support of the US Nuclear Regulatory Commission's (NRC's) efforts to develop a rule that will ensure that workers with unescorted access to protected areas of nuclear power plants are fit for duty. This report supplements information previously published in NUREG/CR-5227, Fitness for Duty in the Nuclear Power Industry: A Review of Technical Issues (Barnes et al., 1988). The primary potential fitness-for-duty concern addressed in both of these reports is impairment caused by substance abuse, although other fitness concerns are discussed. This report addresses issues pertaining to workers' use and misuse of alcohol, prescription drugs, and over-the-counter drugs as fitness-for-duty concerns; responds to several questions raised by NRC Commissioners; discusses subversion of the chemical testing process and methods of preventing such subversion; and examines concerns about the urinalysis cutoff levels used when testing for marijuana metabolites, amphetamines, and phencyclidine (PCP).

36163 (NUREG/CR–5252) **Aerosol sampling and Transport Efficiency Calculation (ASTEC) and application to surtsey/DCH aerosol sampling system: Code version 1.0: Code description and user's manual.** Yamano, N.; Brockmann, J.E. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Systems Research; Sandia National Labs., Albuquerque, NM (USA). May 1989. 147p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC04-76DP00789. (SAND–88-1447). Available from NTIS, PC A - GPO - OSTI.

This report describes the features and use of the Aerosol Sampling and Transport Efficiency Calculation (ASTEC) Code. The ASTEC code has been developed to assess aerosol transport efficiency source term experiments at Sandia National Laboratories. This code also has broad application for aerosol sampling and transport efficiency calculations in general as well as for aerosol transport considerations in nuclear reactor safety issues. 32 refs., 31 figs., 7 tabs.

36164 (NUREG/CR–5291) **Closeout of IE Bulletin 80-09: Hydramotor actuator deficiencies.** Foley, W.J.; Dean, R.S.; Hennick, A. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Operational Events Assessment; Parameter, Inc., Elm Grove, WI (USA). Jun 1989. 13p. Sponsored by Nuclear Regulatory Commission. (PARAMETER/IE–182). Available from NTIS, PC A03/MF A01 - GPO - OSTI.

Documentation is provided in this report for the closeout of IE Bulletin 80-09 on the safety-related subject of ITT General Controls (ITT-GC) Hydramotor actuators models AH-90 and NH-90. The problems reported about inadequate springs and faulty sizing could affect the operation of safety-related equipment installed in nuclear power facilities. Closeout is based on the implementation and verification of actions required by this bulletin. It is concluded that the concerns of the bulletin have been resolved. Evaluation of utility responses and NRC/Region inspection reports indicates that the bulletin is closed for all of the 119 nuclear power reactor facilities in operation or under construction.

36165 (NUREG/CR–5347) **Recommendations for resolution of public comments on USI [Unresolved Safety Issues] A-40, "Seismic Design Criteria".** Philippacopoulos, A.J. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Safety Issue Resolution; Brookhaven National Lab., Upton, NY (USA). Jun 1989. 151p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC02-76CH00016. (BNL-NUREG–52191). Available from NTIS, PC A08/MF A01 - GPO - OSTI.

In June 1988 the Nuclear Regulatory Commission (NRC) issued for public comment the proposed Revision 2 of the Standard Review Plan (SRP) Sections 2.5.2, 3.7.1, 3.7.2. and 3.7.3. Comments were received from six organizations. Brookhaven National Laboratory (BNL) was requested by NRC to provide expert consultation in the seismic and soil-structure interaction areas for the review and resolution of these comments. For this purpose, a panel of consultants was established to assist BNL with the review and evaluation of the public comments. This review was carried out during the period of October 1988 through January 1989. Many of the suggestions given in the public comments were found to be significant and

a number of modifications to appropriate SRP sections are recommended. Other public comments were found to have no impact on the proposed Revision 2 of the SRP. Major changes are recommended to the SRP sections dealing with (a) Power Spectral Density (PSD) and ground motion requirements and (b) soil-structure interaction requirements. This report contains specific recommendations to NRC for resolution of the public comments made on the proposed Revision 2 of the SRP.

36166 (NUREG/CR–5379-Vol.1) **Nuclear plant service water system aging degradation assessment: Phase 1.** Jarrell, D.B.; Johnson, A.B. Jr.; Zimmerman, P.W.; Gore, M.L. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Engineering; Pacific Northwest Lab., Richland, WA (USA). Jun 1989. 75p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC06-76RL01830. (PNL–6560-Vol.1). Available from NTIS, PC A04/MF A01 - GPO - OSTI.

The initial phase of an aging assessment of nuclear power plant service water systems (SWSs) was performed by the Pacific Northwest Laboratory to support the Nuclear Regulatory Commission Nuclear Plant Aging Research (NPAR) program. The SWS was selected for study because of its essential role in the mitigation of and recovery from accident scenarios involving the potential for core-melt. The objectives of the SWS task under the NPAR program are to identify and characterize the principal aging degradation mechanisms relevant to this system and assess their impact on operational readiness, and to provide a methodology for the mitigation of aging on the service water aspect of nuclear plant safety. The first two of these objectives have been met and are covered in this Phase 1 report. A review of available literature and data-base information indicated that motor operated valve torque switches (an electro-mechanical device) were the prime suspect in component service water systems failures. More extensive and detailed data obtained from cooperating utility maintenance records and personnel accounts contradicted this conclusion indicating that biologic and inorganic accumulation and corrosive attack of service water on component surfaces were, in fact, the primary degradation mechanisms. A review of the development of time dependent risk assessment (aging) models shows that, as yet, this methodology has not been developed to a degree where implementation is reliable. Improvements in the accuracy of failure data documentation and time dependent risk analysis methodology should yield significant gains in relating aging phenomena to probabilistic risk assessment. 23 refs., 8 figs., 10 tabs.

36167 (ORNL/FTR–3093) **[International conference on Thermal reactor safety, October 2-7, 1988, Avignon, France]: Foreign trip report.** Malinauskas, A.P. Oak Ridge National Lab., TN (USA). 27 Oct 1988. 10p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC05-84OR21400. Order Number DE89014752/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The traveler presented an invited paper entitled "Chemical Factors Affecting Fission Product Release and Transport" at the International Conference on Thermal Reactor Safety that was held October 2-7, 1988, in Avignon, France, and participated in the conference as a member of the technical program committee. The traveler also agreed to summarize the conference for the journal Nuclear Safety. This report is a presentation of that summary.

36168 Application of probabilistic fracture mechanics to the pressurized-thermal-shock issue. Ball, D.G. (Computing and Telecommunications Div., Martin Marietta Energy Systems, Inc., Oak Ridge, TN (US)). v.v of Proceedings of the eighteenth national symposium on fracture mechanics. Read, D.T.; Reed, R.P. ASTM, Philadelphia, PA (1988). (CONF-850679–: 18. American Society for Testing and Materials national symposium on fracture mechanics, Boulder, Colorado, USA, 25-27 Jun 1985).

As a part of the Nuclear Regulatory Commission (NRC) effort to obtain a resolution to the pressurized water reactor (PWR) pressurized-thermal-shock (PTS) issue, a probabilistic approach has been applied that includes a probabilistic fracture-mechanics (PFM) analysis. The PFM analysis is performed with OCA-P, a computer code that performs thermal, stress, and fracture-mechanics analyses and estimates the conditional probability of vessel failure, P(F vertical bar E), using Monte Carlo techniques. The stress intensity factor (K_I) is calculated for two- and three-dimensional surface flaws using superposition techniques and influence coefficients. Importance-sampling techniques are used, as necessary, to limit to a reasonable value the number of vessels actually calculated. Analyses of three PWR plants indicate that the critical initial flaw depth is very small (5 to 15 mm), the benefit of warm prestressing and the role of crack arrest are transient dependent, crack arrest does not occur for the dominant transients, and the single largest uncertainty in the overall probabilistic analysis is the number of surface flaws per vessel.

36169 Overview of the development of seismic safety assessment techniques for nuclear power plants. Cummings, G.E. (Lawrence Livermore National Lab., CA (USA)); Murray, R.C. v. of Probabilistic safety assessment and risk management PSA '87. Vol. 1. Verl. TUEV Rheinland, Koeln, Germany, F.R. (1987). (CONF-870820–: PSA 87: international topical meeting on probabilistic safety assessment and risk management, Zurich, Switzerland, 31 Aug - 4 sep 1987).

Seismic safety of nuclear power plants has been a concern for a number of years and in some cases has had a strong influence on plant design. To put into proper perspective the earthquake risk from nuclear plants and the elements of the design which contribute to that risk, seismic risk assessment techniques have been developed and utilized. This paper describes some of these seismic risk assessment techniques and presents results of their application to two nuclear power plants. From the results of these and other seismic risk assessments, information was developed to make possible an efficient method for assessing safety margins at nuclear plants with respect to earthquakes. This method and the results from using the method are also described.

36170 Seismic margin screening insights for light water reactors. Prassinos, P.G. (Lawrence Livermore National Lab., CA (USA)); Cummings, G.E.; Amico, P.J. v. of Probabilistic safety assessment and risk management PSA '87. Vol. 1. Verl. TUEV Rheinland, Koeln, Germany, F.R. (1987). (CONF-870820–: PSA 87: international topical meeting on probabilistic safety assessment and risk management, Zurich, Switzerland, 31 Aug - 4 sep 1987).

A study of the results of several seismic PRAs was performed to develop a screening approach for the assessment of the seismic margin of nuclear power plants. This screening approach combines both systems insights and fragility information to simplify the margin review process. The purpose of this paper is to present the basis and method used for the development of the systems screening portion of the seismic margin review methodology.

36171 Seismic risk of a BWR. Wells, J.E. (Lawrence Livermore National Lab., CA (USA)); Murray, R.C. v. of Probabilistic safety assessment and risk management PSA '87. Vol. 1. Verl. TUEV Rheinland, Koeln, Germany, F.R. (1987). (CONF-870820–: PSA 87: international topical meeting on probabilistic safety assessment and risk management, Zurich, Switzerland, 31 Aug - 4 sep 1987).

The simplified seismic risk methodology developed in the U.S. NRC Seismic Safety Margins Research Program (SSMRP) was demonstrated by its application to the Zion power plant (PWR). This simplified seismic risk methodology was applied to the LaSalle nuclear power plant, a BWR to demonstrate its applicability, and if possible, to provide a basis of comparison of seismic risk between a PWR and a BWR when analyzed with comparable methodology and assumptions. This paper describes the seismic risk assessment methodology used to assess the LaSalle nuclear power plant. (orig./HSCH).

36172 Precracking and computerized single-specimen J_{Ic} determination for irradiated three-point bend specimens. Haggag, F.M. (Oak Ridge National Lab., Oak Ridge, TN (US)); Richardson, A.K. v.v of Proceedings of the eighteenth national symposium on fracture mechanics. Read, D.T.; Reed, R.P. ASTM, Philadelphia, PA (1988). (CONF-850679–: 18. American Society for Testing and Materials national symposium on fracture mechanics, Boulder, Colorado, USA, 25-27 Jun 1985).

An experimental procedure is described for precracking and computerized single-specimen J_{Ic} testing of irradiated three-point bend specimens. The specimens were automatically precracked in cantilever bending at constant deflection. The J_{Ic} values determined by

the single-specimen unloading compliance technique were found to be in close agreement with multiple-specimen values. The J_{Ic} testing system comprised a three-point bend fixture and a furnace mounted on a screw-driven Instron testing machine, a Hewlett-Packard computer, and a data acquisition system. This procedure was found to be successful and cost effective in precracking and J_{Ic} testing of the irradiated specimens.

36173 Accident sequence precursor program: Methods improvements and current results. Minarick, J.W. (Science Applications International Corp., Oak Ridge, TN (USA)); Manning, F.M.; Harris, J.D. v. of Probabilistic safety assessment and risk management PSA '87. Vol. 1. Verl. TUEV Rheinland, Koeln, Germany, F.R. (1987). (CONF-870820–: PSA 87: international topical meeting on probabilistic safety assessment and risk management, Zurich, Switzerland, 31 Aug - 4 sep 1987).

Changes in the U.S. NRC Accident Sequence Precursor program methods since the initial program evaluations of 1969-81 operational events are described, along with insights from the review of 1984-85 events. For 1984-85, (1) the number of significant precursors was consistent with the number observed in 1980-81, (2) dominant sequences associated with significant events were reasonably consistent with PRA estimates for BWRs, but lacked the contribution due to small-break LOCAs previously observed and predicted in PWRs, and (3) the frequency of initiating events and non-recoverable system failures exhibited some reduction compared to 1980-81. Operational events which provide information concerning additional PRA modelling needs are also described.

36174 Microcomputer-based systems and plant analyses - the IRRAS and SARA systems. Sattison, M.B. (Idaho National Engineering Lab., Idaho Falls (USA)); Russell, K.D.; Van Siclen, V.S.; Henry, D.M.; Cathey, N.G. v. of Probabilistic safety assessment and risk management PSA '87. Vol. 1. Verl. TUEV Rheinland, Koeln, Germany, F.R. (1987). (CONF-870820–: PSA 87: international topical meeting on probabilistic safety assessment and risk management, Zurich, Switzerland, 31 Aug - 4 sep 1987).

The Integrated Reliability and Risk Analysis System (IRRAS) and the System Analysis and Risk Assessment (SARA) system are microcomputer-based programs developed for the USNRC. These two software packages form the backbone of the USNRC's plan for risk-based decisionmaking and safety goal implementation. They are designed to provide the probabilistic risk assessment (PRA) analyst with a set of tools for analysis as well as to give the regulator the means of quickly assessing the impact on plant risk of changes in the design or operation of a plant due to proposed regulation. (orig./HSCH).

36175 Evaluation of SCC test methods for Inconel 600 in low-temperature aqueous solutions. Newman, R.C. (Corrosion Science Group, Dept. of Nuclear Energy, Brookhaven National Lab., Upton, NY (US)); Roberge, R.; Bandy, R. v.v of Environment-sensitive fracture: Evaluation and comparison of test methods. Dean, S.W.; Pugh, E.N.; Ugiansky, G.M. ASTM, Philadelphia, PA (1984). (CONF-820495–: ASTM symposium on environment sensitive fracture: evaluation and comparison of test methods, Gaithersburg, MD, USA, 25-28 Apr 1982).

In late 1981, widespread leakage was encountered in Alloy 600 steam generator tubing at the Three Mile Island Unit 1 nuclear power plant. The phenomenon was identified as low-temperature intergranular stress-corrosion cracking (SCC) initiated from the inner surfaces of the tubes exposed to the primary coolant. A testing program was initiated to examine the material and environmental factors relevant to these failures, which were found to be associated with sensitization of the material and contamination of the coolant by air and sodium thiosulfate. The test solutions contained 1.3% boric acid with various additions of sulfur compounds and lithium hydroxide. Constant extension rate testing was used as the primary tool to examine environmental effects such as the inhibition of cracking by lithium hydroxide. Important effects of crack initiation frequency on the specimen potential (and therefore crack velocity) are demonstrated. In some of these tests, straining was interrupted following crack initiation, and the effects of further environmental additions were monitored by following the load decay at constant total strain. This procedure generally resulted in a different ranking of the environments. U-bend tests showed that the ranking of different sulfur-containing environments was also highly dependent on the metal heat treatment.

36176 Improved reliability of residual heat removal capability in pressurized water reactors. Chu Tsonglun (Brookhaven National Lab., Upton, NY (USA)); Fitzpatrick, R.; Yoon, W.H. v. of Probabilistic safety assessment and risk management PSA '87. Vol. 2. Verl. TUEV Rheinland, Koeln, Germany, F.R. (1987). (CONF-870820–: PSA 87: international topical meeting on probabilistic safety assessment and risk management, Zurich, Switzerland, 31 Aug - 4 sep 1987).

Operational experience of U.S. PWRs indicates that numerous loss of Residual Heat Removal (RHR) events have occurred during plant shutdown. Of particular significance is the loss of RHR suction due to the inadvertent closure of the RHR suction/isolation valves or an excess lowering of the water level in the reactor vessel. In the absence of prompt mitigative action by the operator, the core may become uncovered. Various design/operational changes have been proposed. The objective of this paper is to estimate the improvement in the RHR reliability and the risk reduction potential provided by those proposed RHR design/operational changes. The benefits of those changes are expressed in terms of the reduction in the frequence of loss-of-cooling events and the frequency of core damage. (orig./HSCH).

36177 NUREG-1150 risk assessment methodology and results. Benjamin, A.S. (Sandia National Labs., Albuquerque, NM (USA)); Boyd, G.J.; Lewis, S.R.; Amos, C.N.; Cunningham, M.A.; Murphy, J.A. v. of Probabilistic safety assessment and risk management PSA '87. Vol. 2. Verl. TUEV Rheinland, Koeln, Germany, F.R. (1987). DOE Contract AC04-76DP00789. (CONF-870820–: PSA 87: international topical meeting on probabilistic safety assessment and risk management, Zurich, Switzerland, 31 Aug - 4 sep 1987).

NUREG-1150 constitutes a full-scope reassessment of the risks to the public from several light water reactor plants with various containment types. Emphasis has been placed on determining the magnitude and character of the uncertainties, rather than focusing upon a point estimate. The risk-reduction potential of proposed plant modifications (backfits and procedural changes) has also been studied, and their costs and benefits have been evaluated. It has been found that the risks from internal events are generally lower than previously evaluated in the Reactor Safety Study (RSS). However, certain unresolved phenomenological issues cause the tops of the uncertainty bands to appear at levels that are comparable to or higher than the RSS point estimates. The issues that are important vary from plant to plant. Most of the postulated plant modifications do not appear to be cost-effective, although a few procedural changes are possible exceptions. Several reviews of this work are in progress, and a second iteration is being performed to include external events, incorporate new technical information, and address comments.

36178 Interfacing systems LOCAs at boiling water reactors. Chu Tsonglun (Brookhaven National Lab., Upton, NY (USA)); Fitzpatrick, R.; Stoyanov, S. v. of Probabilistic safety assessment and risk management PSA '87. Vol. 2. Verl. TUEV Rheinland, Koeln, Germany, F.R. (1987). (CONF-870820–: PSA 87: international topical meeting on probabilistic safety assessment and risk management, Zurich, Switzerland, 31 Aug - 4 sep 1987).

The Reactor Safety Study identified an interfacing system LOCA in a PWR as a significant contributor to risk from accidents that result in severe core damage. For BWRs, interfacing LOCA have typically either not been considered in probabilistic risk analyses, or if considered, were judged to contribute little to the risk estimate because of their perceived low frequency of occurrence. However, recent operating experience indicates that the pressure isolation valves (PIVs) in BWRs may not adequately protect against overpressurization of low pressure systems. In fact, four events of overpressurization of low pressure systems have already occurred at BWRs. The objective of this paper is to present the results of a study which analyzed interfacing system LOCA at several BWRs. The BWRs were selected to best represent a spectrum of BWRs in service using industry operating event experience and plant-specific information/configurations. The results presented here include some

possible changes in test requirements/practices as well as an evaluation of their reduction potential in terms of core damage frequency (CDF). (orig./HSCH).

36179 Generic safety insights for inspection of boiling water reactors. Higgins, J.C. (Brookhaven National Lab., Upton, NY (USA)); Hillmann, B.M. v. of Probabilistic safety assessment and risk management PSA '87. Vol. 2. Verl. TUEV Rheinland, Koeln, Germany, F.R. (1987). (CONF-870820–: PSA 87: international topical meeting on probabilistic safety assessment and risk management, Zurich, Switzerland, 31 Aug - 4 sep 1987).

Generic safety insights, to aid in the inspection of U.S. Boiling Water Reactors (BWRs), are developed using existing BWR Probabilistic Risk Assessment (PRAs). These generic insights can be used directly to inspect BWRs without PRAs or to develop detailed plant specific inspection guides for those plants without PRAs. Methodology as well as some examples of the generic insights are presented.

36180 DOE advanced reactor severe accident program (ARSAP) - an overview. Fontana, M.H. (IT Corp., Oak Ridge, TN (USA)); Buhl, R.; Copp, R.D. v. of Probabilistic safety assessment and risk management PSA '87. Vol. 3. Verl. TUEV Rheinland, Koeln, Germany, F.R. (1987). (CONF-870820–: PSA 87: international topical meeting on probabilistic safety assessment and risk management, Zurich, Switzerland, 31 Aug - 4 sep 1987).

The U.S. DOE has implemented the Advanced Reactor Severe Accident Program (ARSAP) to assure resolution of severe accident related issues and to support industry efforts to certify standardized advanced light water reactors. This paper provides an overview of the program. (orig./HSCH).

36181 Application of generic PRA insights to NRC inspection. Fisher, J.E. (Idaho National Engineering Lab., Idaho Falls (USA)); Gregg, R.E.; Hinton, M.F.; Wright, R.E.; Hillman, B.M. v. of Probabilistic safety assessment and risk management PSA '87. Vol. 3. Verl. TUEV Rheinland, Koeln, Germany, F.R. (1987). DOE Contract AC07-76ID01570. (CONF-870820–: PSA 87: international topical meeting on probabilistic safety assessment and risk management, Zurich, Switzerland, 31 Aug - 4 sep 1987).

The NRC has developed a program that uses probabilistic risk assessment (PRA) results to produce plant specific inspection guidelines for use by NRC inspectors. Because only about one-quarter of the operating United States (U.S.) plants have PRAs, a generic methodology has been proposed for the production of inspection guidelines for plants without PRAs. The first application of this proposed generic method was to a plant which has a PRA, so a comparison of the inspection guidance produced by the PRA-based and generic methods could be made. An evaluation of the comparison from that application is provided. (orig./HSCH).

36182 PRISIM - a plant risk status information management system for NRC inspectors. Reilly, H.J. (Idaho National Engineering Lab., Idaho Falls (USA)); Glynn, J.C.; Campbell, D.J. v. of Probabilistic safety assessment and risk management PSA '87. Vol. 3. Verl. TUEV Rheinland, Koeln, Germany, F.R. (1987). DOE Contract AC07-76ID01570. (CONF-870820–: PSA 87: international topical meeting on probabilistic safety assessment and risk management, Zurich, Switzerland, 31 Aug - 4 sep 1987).

The Plant Risk Status Information Management System (PRISIM) is a microcomputer program that presents results of probabilistic risk assessments (PRAs), and related informations, for use by US-NRC decisionmakers. Plant-specific PRISIMs have been developed for three nuclear plants in the United States. The usefulness of PRISIM for these plants is now under evaluation, and an improved PRISIM is being developed. (orig./HSCH).

36183 Chernobyl-4 accident analysis. Purvis, E.E. (Department of Energy, Washington, DC (USA)); Spencer, B. v. of Probabilistic safety assessment and risk management PSA '87. Vol. 3. Verl. TUEV Rheinland, Koeln, Germany, F.R. (1987). (CONF-870820–: PSA 87: international topical meeting on probabilistic safety assessment and risk management, Zurich, Switzerland, 31 Aug - 4 sep 1987).

The U.S. Department of Energy formed a team of experts in July of 1986 to better understand the Chernobyl-4 accident. The team's analyses confirmed the plausibility of the results of Soviet analyses presented at the Chernobyl-4 Post-Accident Review meeting held 1986 in Vienna, Austria. The accident was a loss of flow induced (by flow reduction) transient overpower (LOF TOP) excursion that took place in two stages. This paper will concentrate on the accident energetics and, in particular, on some new information. (orig./HSCH).

36184 Characterization and chemistry of fission products released from LWR fuel under accident conditions. Norwood, K.S. (Oak Ridge Nat. Lab., Oak Ridge, TN (US)); Collins, J.L.; Osborne, M.F.; Lorenz, R.A.; Wichner, R.P. v.v of Proceedings of the American Nuclear Society meeting on fission-product behaviour and source term research. American Nuclear Society, La Grange Park, IL (1985). (CONF-8507160–: ANS meeting on fission product behaviour and source term research, Snowbird, Utah, USA, 15-19 Jul 1985).

Segments from commercial LWR fuel rods have been tested at temperatures between 1400 and 2000^{0}C in a flowing steam-helium atmosphere to simulate severe accident conditions. The primary goals of the tests were to determine the rate of fission product release and to characterize the chemical behavior. This paper is concerned primarily with the identification and chemical behavior of the released fission products with emphasis on antimony, cesium, iodine, and silver. The iodine appeared to behave primarily as cesium iodide and the antimony and silver elements, while cesium behavior was much more complex.

36185 Mass spectrometric study of the release of volatile fission products from irradiated LWR fuel. Johnson, I. (Argonne Nat. Lab., Argonne, IL (US)); Steidl, D.V.; Johnson, C.E. v.v of Proceedings of the American Nuclear Society meeting on fission-product behaviour and source term research. American Nuclear Society, La Grange Park, IL (1985). (CONF-8507160–: ANS meeting on fission product behaviour and source term research, Snowbird, Utah, USA, 15-19 Jul 1985).

The chemical form and rate of release of volatile fission products (i.e., Xe, Kr, Cs, Te, I,...) effused from a section of an irradiated LWR fuel pin are being studied using quadrupole mass spectrometry. The released volatile fission products must effuse through a hole drilled in the cladding to reach the ionizer of the mass spectrometer. Experiments to a temperature of 1450^{0}C have identified krypton, xenon, cesium, tellurium, and atomic iodine (very weak signal) as the species released from the fuel. The source of the atomic iodine, i.e. dissociation of cesium iodide or dissociation of molecular iodine, has yet to be resolved. The observed rate of release of xenon is several orders of magnitude lower than previously reported. In complimentary experiments on nonradioactive material, the reaction of tellurium with the Zircaloy cladding was found to hinder its release. Above 1200^{0}C, gaseous SnTe was observed; its formation is attributed to reaction of the tin (in the cladding) with $ZrTe_2$.

36186 Iodine volatility. Beahm, E.C. (Oak Ridge Nat. Lab., Oak Ridge, TN (US)); Shockley, W.E. v.v of Proceedings of the American Nuclear Society meeting on fission-product behaviour and source term research. American Nuclear Society, La Grange Park, IL (1985). (CONF-8507160–: ANS meeting on fission product behaviour and source term research, Snowbird, UT, USA, 15-19 Jul 1985).

The authors are carrying out a program, the ultimate aim of which is to couple experimental aqueous iodine volatiles to a fission product release model. Iodine partition coefficients for inorganic iodine have been measured during hydrolysis and radiolysis. The hydrolysis experiments have illustrated the importance of reaction time on iodine volatility. However, radiolysis effects can override hydrolysis in determining iodine volatility. In addition, silver metal in radiolysis samples can react to form silver iodide accompanied by a decrease in iodine volatility. The authors are presently engaged in the process of coupling experimental data to an iodine transport and release model.

36187 LWR aerosol containment experiments (LACE) program and initial test results. Muhlestein, L.D. (Westinghouse Hanford Co., Richland, WA (US)); Hilliard, R.K.; Bloom, G.R.; McCormack, J.D.; Rahn, F.J. v.v of Proceedings of the American Nuclear Society meeting on fission-product behaviour and source term research. American Nuclear Society, La Grange Park, IL

(1985). (CONF-8507160–: ANS meeting on fission product behaviour and source term research, Snowbird, Utah, USA, 15-19 Jul 1985).

The LWR aerosol containment experiments (LACE) program is described. The LACE program is being performed at the Hanford Engineer Development Laboratory (operated by Westinghouse Hanford Company) and the initial tests are sponsored by EPRI. The objectives of the LACE program are: to demonstrate, at large-scale, inherent radioactive aerosol retention behavior for postulated high consequence LWR accident situations; and to provide a data base to be used for aerosol behavior . Test results from the first phase of the LACE program are presented and discussed. Three large-scale scoping tests, simulating a containment bypass accident sequence, demonstrated the extent of agglomeration and deposition of aerosols occurring in the pipe pathway and vented auxiliary building under realistic accident conditions. Parameters varied during the scoping tests were aerosol type and steam condensation.

36188 A sensitivity of aerosol agglomeration and deposition using the MAEROS model. Leigh, C.D. (Sandia Nat. Lab., Albuquerque, NM (US)); Helton, J.C. v.v of Proceedings of the American Nuclear Society meeting on fission-product behaviour and source term research. American Nuclear Society, La Grange Park, IL (1985). (CONF-8507160–: ANS meeting on fission product behaviour and source term research, Snowbird, Utah, USA, 15-19 Jul 1985).

In support of the MELCOR program, a study of the sensitivities and uncertainties associated with MAEROS aerosol code predictions has been performed for TMLB accident conditions using Latin hypercube sampling techniques and regression analysis methods. Agglomeration and deposition in the reactor containment of two aerosol components, and in-vessel aerosol and an ex-vessel aerosol, were examined by varying the values of 24 code input parameters that defined containment geometry, containment thermal-hydraulic conditions, aerosol source characteristics, and agglomeration and deposition rate constants. Twenty aerosol size sections, spanning the size range of 0.01 to 200 μ were used to develop the sensitivities and uncertainties associated with code predictions of the total suspended mass, the time to 90 percent deposition, and the total integrated gas borne mass density of each aerosol component. These sensitivities and uncertainties were found to depend principally on the following four input parameters: the source strength of the ex-vessel aerosol, the agglomeration shape factor, the turbulent energy dissipation rate, and the particle mass density.

36189 Phenomenological uncertainties in the suspended radionuclide concentrations in containment during severe LWR accidents. Williams, D.C. (Sandia Nat. Labs., Albuquerque, NM (US)); Murata, K.K.; Tills, J.L. v.v of Proceedings of the American Nuclear Society meeting on fission-product behaviour and source term research. American Nuclear Society, La Grange Park, IL (1985). (CONF-8507160–: ANS meeting on fission product behaviour and source term research, Snowbird, Utah, USA, 15-19 Jul 1985).

CONTAIN, a code for integrated analysis of containment phenomenologies in complex LWR sever accident sequences, is being applied in a program for evaluating the uncertainties in USNRC-sponsored efforts to better define LWR accident source terms. The Surry TMLB sequence is studied in detail. Aerosol agglomeration uncertainties are found to contribute about an order of magnitude to the overall uncertainty in suspended radionuclides (almost entirely downward uncertainty; i.e., downward with respect to current base case estimates such as BMI-2104). Containment compartmentalization effects contribute substantial uncertainties in either direction, while effects due to complex multicomponent aerosol compositions contribute lesser, but still potentially significant uncertainties (mostly downward). Incomplete treatment of radionuclide decay chains can contribute factor-of-two upward uncertainties.

36190 Fission product behaviour during the TMI-2 accident. Tooper, F.E. (USDOE, Washington, DC (US)). v.v of Proceedings of the American Nuclear Society meeting on fission-product behaviour and source term research. American Nuclear Society, La Grange Park, IL (1985). (CONF-8507160–: ANS meeting on fission product behaviour and source term research, Snowbird, Utah, USA, 15-19 Jul 1985).

An overview of the TMI-2 accident analysis and fission product behavior research activities performed for the DOE is presented. Included in the overview are the latest results from the TMI-2 accident sequence assessment. Concomitant implications related to fission product transport, deposition, and retention mechanisms for core metal dominant accident sequences are also discussed. Other areas are being addressed as part of the TMI-2 accident sequence assessment, such as core degradation phenomena including debris bed coolability. A summary of observation is provided.

36191 TMI-2 core debris analytical methods and results. Akers, D.W. (EG and G Idaho Inc., Idaho Falls, ID (US)); Cook, B.A. v.v of Proceedings of the American Nuclear Society meeting on fission-product behaviour and source term research. American Nuclear Society, La Grange Park, IL (1985). (CONF-8507160–: ANS meeting on fission product behaviour and source term research, Snowbird, Utah, USA, 15-19 Jul 1985).

A series of six grab samples was taken from the debris bed of the TMI-2 core in early September 1983. Five of these samples were sent to the Idaho National Engineering Laboratory for analysis. Presented is the analysis strategy for the samples, and some of the data obtained from the early stages of examination of the samples (i.e., particle size-analysis, gamma spectrometry results, and fissile/fertile material analysis).

36192 TMI-2 leadscrew radionuclide deposition and characterization. Vinjamuri, K. (EG and G Idaho Inc., Idaho Falls, ID (US)); Akers, D.W.; Hobbins, R.R. v.v of Proceedings of the American Nuclear Society meeting on fission-product behaviour and source term research. American Nuclear Society, La Grange Park, IL (1985). (CONF-8507160–: ANS meeting on fission product behaviour and source term research, Snowbird, Utah, USA, 15-19 Jul 1985).

Two leadscrews, H8 and B8, from the TMI-2 reactor were examined by EG and G Idaho Inc., at the Idaho National Engineering Laboratory. Metallography, hardness measurements, and chemical and radiological analyses were conducted on samples cut from the leadscrews. Hardness measurements and microstructure analysis suggest that a significant temperature gradient existed between the portions of the leadscrews closest to the core and the portions near the top of the upper plenum, and leadscrew B8 experienced a slower cooling rate than H8. Chemical analyses indicate that UO_2 and Zr were deposited on surfaces closer to the core. Radiological analyses suggest that a majority of the H8 radionuclides are insoluble in strong acid solutions. In contrast, the majority of the B8 radionuclides are soluble in strong acidic solutions. Significant radioactivity is associated with the smallest size ($\leq$0.45 μm) brush off debris. The greatest activity was found close to the top of the upper plenum.

36193 Radionuclide distribution in TMI-2 reactor building basement liquids and solids. Horan, J.T. (EG and G Idaho Inc., Idaho Falls, ID (US)); Keefer, D.G.; McIsaac, C.V. v.v of Proceedings of the American Nuclear Society meeting on fission-product behaviour and source term research. American Nuclear Society, La Grange Park, IL (1985). (CONF-8507160–: ANS meeting on fission product behaviour and source term research, Snowbird, Utah, USA, 15-19 Jul 1985).

Large quantities of radioactive water and some core debris solids were released to the reactor building basement during the March 1979 accident at Three Mile Island Unit 2 (TMI-2). A reactor building basement sampling and analysis program is underway to support fission product mass balance and source term studies, TMI-2 accident analysis, and decontamination planning. Liquid and solid samples were collected from a variety of locations to determine the composition, quantity, and distribution of the debris and fission products released to the basement environment. Basement water sources, sample history, and sampling techniques are discussed. Fuel, radionuclide content and elemental composition of liquid and solid samples are presented. Conclusions are presented on the partitioning of fission products within liquids and solids and on the transport paths within the basement area.

36194 Results of surface activity and radiation field measurements made during surface decontamination experiments

conducted at TMI-2. McIsaac, C.V. (EG and G Idaho Inc., Idaho Falls, ID (US)); Davis, C.M.; Horan, J.T.; Keefer, D.G. v.v of Proceedings of the American Nuclear Society meeting on fission-product behaviour and source term research. American Nuclear Society, La Grange Park, IL (1985). (CONF-8507160–: ANS meeting on fission product behaviour and source term research, Snowbird, Utah, USA, 15-19 Jul 1985).

The loss of coolant accident at TMI-2 exposed about 22000 square meters of concrete and metal surfaces within the reactor building to liquid and vapor-phase radionuclide contamination. During the course of the accident, floors and walls of the auxiliary fuel handling building were also contaminated. Since 1981 the decontamination of these surfaces has been conducted using water spray, strippable coating, and scabbling techniques. These decontamination studies have helped determine the distribution of radionuclides on building surfaces and the nature of the radionuclide penetration into surface coatings. In addition, in situ radiological surveys of decontamination effectiveness were performed. This paper reviews the results of these surface decontamination studies and presents conclusions on the nature and extent of reactor building contamination as a consequence of the TMI-2 accident.

36195 **Effects on consequences of the high steam content in LWR accident releases.** Spulak, R.G. Jr. (Sandia Nat. Labs., Albuquerque, NM (US)); Boughton, B.A.; Williams, D.C.; Cummings, J.C.; Alpert, D.J.; Richards, C.N.; Dunn, W.E. v.v of Proceedings of the American Nuclear Society meeting on fission-product behaviour and source term research. American Nuclear Society, La Grange Park, IL (1985). (CONF-8507160–: ANS meeting on fission product behaviour and source term research, Snowbird, UT, USA, 15-19 Jul 1985).

This research has addressed the possibility that condensation of steam during the release of containment gases and aerosol particles to the atmosphere after a coremelt accident could deposit a significant fraction of the radioactive material near the plant. This paper describes the modeling of accident releases including this 'rainout' and discusses the impact of the findings on risk predictions. The models include details of the hydrodynamics of the flow from containment, thermodynamics of the release mixture, explicit consideration of condensation on the radioactive aerosols, turbulent agglomeration of aerosols and water droplets, buoyant plume physics, and the dispersion and deposition of drops. The authors discuss the initial and boundary conditions which lead to significant rainout.

36196 **Sensitivity/uncertainty analysis for free-in-air tissue kerma due to initial radiation at Hiroshima and Nagasaki.** Lillie, R.A. (4832000); Broadhead, B.L.; Pace, J.V. III. *Nuclear Science and Engineering (USA)*, 100(2): 105-124 (Oct 1988).

Uncertainty estimates and cross correlations by range/survivor have been calculated for the Hiroshima and Nagasaki free-in-air (FIA) tissue kerma obtained from two-dimensional air/ground transport calculations. The uncertainties due to modeling parameter and basic nuclear transport data uncertainties were calculated for 700-, 1000-, and 1500-m ground ranges. Only the FIA tissue kerma due to initial radiation was treated in the analysis; the uncertainties associated with terrain and building shielding and phantom attenuation were not considered in this study. Uncertainties of –20% were obtained for the prompt neutron and secondary gamma kerma and 30% for the prompt gamma kerma at both cities. The uncertainties on the total prompt kerma at Hiroshima and Nagasaki are –18 and 15%, respectively. The estimated uncertainties vary only slightly by ground range and are fairly highly correlated. The total prompt kerma uncertainties are dominated by the secondary gamma uncertainties, which in turn are dominated by the modeling parameter uncertainties, particularly those associated with the weapon yield and radiation sources.

36197 (DOE/IR/05106–T54) **Thermal energy storage: An application guide for local governments.** Teji, D.S. Urban Consortium for Technology Initiatives (USA). Energy Task Force. Feb 1988. 63p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract FG02-78IR05106. Order Number DE89014913/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

Thermal energy storage technology is a comparatively new technology that is receiving attention throughout the United States and the world. The main object of this strategy is to lower the peak electricity demand by shifting the peak demand (KW) and energy use (KWH) from high demand hours to low demand hours. This strategy is receiving favor from the utility industry, with special rebates often available to those who install thermal energy storage systems. In 1985, the Urban Consortium Energy Task Force formally approved funding for a project proposed by the City of Phoenix. The project selected was Thermal Storage Strategies For Energy Cost Reduction. This project was successfully completed with very interesting results and many lessons learned as a sideline. This project was implemented as a retrofit to the existing air conditioning system at the Century Branch Library of the City of Phoenix. In the conduct of this project, elaborate research on the technology was supported. Publications describing the latest relevant technology were studied, and several existing sites with similar applications were visited. There are jurisdictions where the potential for similar applications exist, but practical implementation is constrained by the lack of guidelines and experience. The purpose of this project is to provide other jurisdictions with ready-to-use guidelines applicable to their own specific situations.

36198 (ITL–8509, pp. 218-221) **An evaluation of solar heating systems with seasonal storage in New England. Systems using duct storage in rock and heat pump.** Breger, D.S. (Argonne National Lab., Argonne, IL, USA); Michaels, A.I. Intertask Ltd., Ottawa, ON (Canada). 1985. (In English and French). (CONF-850905–: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG–89-00267). In *Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This evaluation focuses on the New England region of the United States, and considers seasonal storage of solar energy using duct storage in rock and a heat pump. Adequate bedrock for large scale storage is available in the New England region and the climate, which includes cold, relatively cloudy winters and summers with substantial insolation, makes seasonal storage technology of particular interest. The general results of the analysis indicate that the optimized systems provide 75-80% of the low temperature demand load and 60-65% of the high temperature demand load with solar energy, with the remaining portion coming primarily from the heat pump electrical input energy. The annualized cost of the energy supplied by the system to the distribution network using the base case economic scenario is $44-52/MWh and $58-62/MWh for the low and high temperture loads, respectively. Energy costs in the New England area are comparable to these values. 3 refs., 4 figs., 1 tab.

36199 (ITL–8509, pp. 249-253) **Transient response of an in-ground vertical cylindrical heat exchanger. Thermal characterization of the soil.** Leroy, G. (Univ. de Nantes, Nantes Cedex, France). Intertask Ltd., Ottawa, ON (Canada). 1985. (In French). (CONF-850905–: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG–89-00267). In *Enerstock 85. 3rd international conference on energy storage for building heating and cooling. Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON,

Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

A bidimensional, transitional model is presented of coupled heat transfers between a heat exchanger, consisting of two coaxial cylindrical tubes, and the soil. The model was used to study the influence of the nature of the walls, the thermal resistance of the exchanger-soil contact, the inertia of the heat transfer fluid and the walls, the flow regime, and the thermal characteristics of the ground, on the performance of the heat exchanger. The sensitivity of the model to conductivity, diffusivity, and thermal resistance of the exchanger-soil contact is tested. 5 refs., 4 figs., 1 tab.

36200 (ITL–8509, pp. 202-207) **Ground heat technology in Sweden.** Andersson, S. (AIB Consulting Engineers, Solna, Sweden). Intertask Ltd., Ottawa, ON (Canada). 1985. (In English and French). (CONF-850905–: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG–89-00267). In *Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Ground heat storage in Sweden normally refers to heat storage in rock, clay or peat. Bedrock suitable for different concepts of borehole heat stores is accessible in most parts of the country, whereas clay and peat in settled areas are concentrated in specific regions. A number of ground heat storage projects have been implemented during the last years in rock as well as in clay and peat. The projects are in different stages of follow up and evaluation. Other projects are planned or under design. The paper deals with technical solutions, environmental aspects, economy and potential for the different storage concepts. 7 refs., 5 figs., 1 tab.

36201 (ITL–8509, pp. 268-271) **System design for borehole heat stores, general aspects and operational experience from the store at Lulea, Sweden.** Nordell, B. (Lulea Univ. of Technology, Lulea, Sweden); Sehlberg, T.; Abyhammar, T. Intertask Ltd., Ottawa, ON (Canada). 1985. (In English and French). (CONF-850905–: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG–89-00267). In *Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Heat storing is not only a matter of heat capacity and losses. It is of great economical importance that charging and discharging can take place in a controlled, planned, and optimal way. In this paper the interface between the storage and the distribution system is analyzed generally and specifically for borehole stores. The design of and operational experience from the 2 GWh Lulea storage for industrial waste heat at 70^{0}C are presented. Discharge is carried out with a combined direct heat-exchanger and heat pump system operating in three modes. Heat is supplied to one large building with district heating back-up. Experience from two cycles, 1983-1985, is presented. 2 refs., 4 figs.

36202 (ITL–8509, pp. 279-283) **Capacity of saturated or unsaturated soil to restore calories by gelation.** Saix, C. (Lab. de Genie Civil, Montpellier, France); Jouanna, P. Intertask Ltd., Ottawa, ON (Canada). 1985. (In English and French). (CONF-850905–: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG–89-00267). In *Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The efficiency of off-season storage of solar energy in saturated or unsaturated soils may be greatly increased by the possibility of using such soils as a cold heat pump source below 0^{0}C. The attraction of this energy recovery form lies in the use of the latent heat of phase change of the water in the soil. However, there are still some unknowns concerning the soil types best suited to this process and possible risks or operational problems essentially related to the behavior of the soil in the vicinity of the heat exchanger. The parameters studied in laboratory and field experiments are: power and energy; range of soil temperatures; capillary suction in the soil; swelling or compaction at the soil surface; and cracking of the soil. The analysis of the experimental results; leading to a classification of soils studied in terms of their capacity to restore calories by gelation, depends essentially on examination of changes in the different parameters with time, in oreder to determine invariance or variance in energy recovery. 4 refs., 6 figs.

36203 (ITL–8509, pp. 284-289) **Thermal conductivity of rock and soil.** Sundberg, J. (Chalmers Univ. of Technology, Goeteborg, Sweden). Intertask Ltd., Ottawa, ON (Canada). 1985. (In English and French). (CONF-850905–: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG–89-00267). In *Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The thermal parameters of soil and rock have been examined for several years, in connection with projects using ground as a heat source or as an energy storage. In rock, about 3000 samples form the basis for an extensive statistical study of thermal conductivity for different rock types in Sweden. In soil, a large number of thermal conductivity measurements have been carried out in connection with determinations of water content, density, water retention curve, and for some samples also the mineral content. Diagrams for the thermal conductivity of different Swedish soil types have been established. 10 refs., 7 figs.

36204 (ITL–8509, pp. 337-340) **Cooling with ice. Canadian progress.** Morofsky, E. (Public Works Canada, Ottawa, ON, Canada). Intertask Ltd., Ottawa, ON (Canada). 1985. (In English and French). (CONF-850905–: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG–89-00267). Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

A fully automated ice formation, storage, and utilization method has now been developed, using a layer-by-layer method of building an ice block from the bottom up and an energy extraction technique based on direct contact between water and ice. The system has been tested over several years and applied to both building cooling and to the chilling of vegetable crops. Evaluation of the cost-effectiveness of specific design applications is now underway. 17 refs.

36205 (ITL–8509, pp. 341-344) **Ice production using ambient winter temperatures.** Vigneault, C. (Engineering and Statistical Research Inst., Agriculture Canada, Ottawa, ON, Canada); Lemieux, M. Intertask Ltd., Ottawa, ON (Canada). 1985. (In English and French). (CONF-850905–: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG–89-00267). In *Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

In 1982, Agriculture Canada undertook studies aimed at reintroducing the utilization of ice, wherever it proves economical, as a means of storing winter coldness. The ice-making system produces a block of ice by adding successive thin layers of water to the floor

of an insulated storage shed, and freezing them by cold outside air introduced via a ventilation system. An air distribution system has been developed as well as a water spray nozzle that satisfies all the requirements for the distribution of water in the production of ice by layers. An ice-level detector has also been developed to control the lift mechanisms for the air and water distribution systems. The average coefficient of performance value of the system was about 21, which is a substantial improvement over that of conventional refrigeration systems (2 to 4). 4 refs., 3 figs.

36206 (ITL–8509, pp. 375-395) **Seasonal storage of heat for district heating in Sweden.** Sabel, H. (The Swedish District Heating Association, Sweden). Intertask Ltd., Ottawa, ON (Canada). 1985. (In English and French). (CONF-850905–: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG–89-00267). In *Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

District heating has a relatively long tradition and is widely employed in Sweden. Since the end of the 1940s, district heating systems have been built in approximately 140 municipalities. New techniques, such as heat pumps, could easily be introduced into the district heating systems. Energy storage may be an attractive future alternative in the energy supply of the municipalities. This claim is based on the favourable experience of the demonstration plants built so far. This paper explains the following benefits of energy storage: the evening-out of the variations in load reduced investments; the utilisation of temporary surpluses of energy reduced fuel consumption; the creation of temporary heat drops increased electric power generation; and the utilisation today of the energy which is only available during the summer. 11 refs., 11 figs., 2 tabs.

36207 (ITL–8509, pp. 300-304) **Development of heat storage systems with vertical pipes in earth and rock.** Wilen, P. (Chalmers Univ. of Technology, Goeteborg, Sweden); Rhen, I.; Baeckstroem, B. Intertask Ltd., Ottawa, ON (Canada). 1985. (In English and French). (CONF-850905–: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG–89-00267). Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

In the last ten years different methods for energy storage in the subsurface have been investigated. This study deals with heat storage systems with vertical boreholes or pipes (ducts) as heat exchangers in the ground. In Sweden these systems are today economical to use only in some cases, but if the investment cost can be reduced the demand for heat storage will increase. The aim of the project is to investigate the possible cost reductions that can be gained by developing the technique of heat storage constructions. Experience from fullscale projects and new construction ideas are considered. The study includes drilling methods and costs, properties of vertical heat exchangers, calculations of heat transfer, and economic considerations. 12 refs., 5 figs.

36208 (ITL–8509, pp. 307-315) **The "Fabrikaglace" process to make and store natural ice.** Buie, S. (Centre de recherche industriel du Quebec, Sainte-Foy, PQ, Canada). Intertask Ltd., Ottawa, ON (Canada). 1985. (In English and French). (CONF-850905–: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG–89-00267). In *Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This paper details the construction and use of a small shelter called "Fabrikaglace" that fabricates a block of ice during winter to be used for air conditioning in summer. The ice is formed due to an exchange of energy with the cold outside air brought in by a forced circulation system that distributes the air evenly over the surface of the ice. The city water is sprayed automatically as a function of the outside temperature by a motorized revolving sprinkler in a 2 mm thick layer. The air and water distribution systems are gradually raised as the ice grows to maintain a constant distance above the ice. The water distribution and the lifting mechanism are under microprocessor control based on accumulated degree minutes of freezing. Underneath a large scale "Fabrikaglace", a cold air circulation system is installed underneath the base slab and controlled to maintain the temperature between -1 to -4^{0}C. To transfer the reject heat from the air conditioning system to the block of ice, the melt water is used in open circuit piping along with a heat exchanger, a spraying device, and a circulating pump controlled by an aquastat immersed in the chilled water of the air conditioning system. 12 figs.

36209 (ITL–8509, pp. 316-320) **An annual storage ice system for summer cooling.** Francis, C.E. (Illinois State Univ., Normal, IL, USA). Intertask Ltd., Ottawa, ON (Canada). 1985. (In English and French). (CONF-850905–: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG–89-00267). In *Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The cold air of winter is used for producing relatively large amounts of ice in long-term underground storage. The stored cooling capacity of the ice is recovered during the following summer. Initial research indicates that in regions where the winter is sufficiently cold and of sufficient duration, this type of system could provide summer air conditioning, refrigeration, or process cooling. A water-saturated earth storage mass of 113 cubic meters was frozen after 589 hours of system operation beginning December 19, 1984. During the 1984 cooling recovery operation, the system ran for a total of 32 days. During this period, 2613 kWh were recovered with an estimated 5 to 8% of the stored cooling capacity remaining. However, all of the ice had been melted. 3 refs., 4 figs., 3 tabs.

36210 (ITL–8509, pp. 499-504) **Presentation of a software package for automated evaluation of soil heat storage projects.** Sauty, J.P. (Bureau de Recherches Geologiques et Minieres Orleans, France); Ausseur, J.Y. Intertask Ltd., Ottawa, ON (Canada). 1985. (In French). (CONF-850905–: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG–89-00267). In *Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The Bureau de Recherches Geologiques et Minieres (France) has been working for almost ten years in the field of soil heat storage by injection of hot water into an aquifer or by circulation of water in a closed loop in buried heat exchanger. With the benefit of this experience, the authors have compiled the various simplified formulas and charts in a publication soon to be completed. A computerized version of this manual is being prepared in 1985, used in conversational mode: the various climatic, thermal, hydraulic and financial parameters are requested of the user and default values are proposed. A description of the problems and decisions to be taken are clearly displayed on the screen at the appropriate mement. In output, the software displays the recovery rate of stored calories, the changes in energy levels and the thermal impact on the subsoil; coverage of surface requirements and evaluation of investments and operating costs appear opposite the quatities of energy conserved and transferred. Finally, this software package processes not only heat storage, but also direct use without thermal replenishment (heat pumps using ground water or soil-to-water heat pumps). 12 refs., 6 figs.

36211 (ITL–8509, pp. 494-498) **Energy storage by adsorption of water on zeolite for building heating.** Restuccia, G. (CNR Inst. for Transformation and Storage of Energy, Messina, Italy); Cacciola, G.; Recupero, V.; Di Leonardo, R. Intertask Ltd., Ottawa, ON (Canada). 1985. (In English and French). (CONF-850905–: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG–89-00267). In *Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

In this paper, the possible applications for civil uses of a a machine based upon the adsorption/desorption process of water vapour on zeolite is discussed. The paper describes the design of a satisfactory heat transfer model with emphasis on the description of the shell and finned-tube heat exchanger located in the zeolite bed. A summary of work done on the plant assembly and the experimental results are given. Possible applications of the system to the civil sector are discussed. Zeolites are solids with very low thermal conductivity. heat transfer toward thermal source and load is the limiting factor for high specific power and economic feasibility of the system. The zeolite-water adsorption heat storage is a closed-loop cycle where the mass transfer depends upon the differential vapour pressure between the water and the zeolite so that there is little pressure drop due to the zeolite packed bed or to the plant configuration, reducing the problem created by mass transfer. 7 refs., 6 figs.

36212 (ITL–8509, pp. 490-493) **A HVAC system based on seasonal heat storage.** Oestensson, B. (Scandenergy, Nykoeping, Sweden). Intertask Ltd., Ottawa, ON (Canada). 1985. (In English and French). (CONF-850905–: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG–89-00267). In *Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

In October 1984, a new heating, ventilation and air conditionig system was put into operation at Viberga supermarket in Finspong, Sweden. The system includes a heat storage where waste heat from freezers and from air conditioning is stored during summer. The storage consists of rock surrounding 24 drilled holes each of which is 110 m deep. The rock is heated to approximately 25^{0}C. In winter, the supermarket is heated with stored heat via a heat pump. Together with waste heat from freezers this heat covers 90% of the total heat demand of 1200 MWh. The last 10% is covered by a peak load oil burner. The system was built by SCANDENERGY on a purely commercial basis, with a pay off time for the investment of five years. This paper presents system design and experiences from construction and operation. 3 figs.

36213 (ITL–8509, pp. 485-489) **The borehole heat store at Lulea, Sweden.** Nordell, B. (Lulea Univ. of Technology, Lulea, Sweden). Intertask Ltd., Ottawa, ON (Canada). 1985. (In English and French). (CONF-850905–: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG–89-00267). In *Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

In 1982-83, the first large-scale borehole heat store was constructed at Lulea University of Technology, Sweden. The main part of the seasonal heat storage system is a rock volulme of 100,000 m^3. The store is utilized for heating of one of the university buildings, with a heat demand of 2 GWh. This demand corresponds to the need of 100 one-family-houses in northern Sweden. The store is connected to the district heating system. The heat is produced by surplus gas from the local steel plant. During May to October the store is heated to 65^{0}C. During November to April the store is discharged, and the temperature is lowered to about 30^{0}C. The store has been in operation since July 1983. Heat input and output have varied considerably during the operation. When charging, the variations depend on temperature fluctuations in the district heating net. Heat output variations depend on a varying heat demand of the building. The operation of the heat store has been simulated by Hellstroem, Lund Institute of Technology. The calculated rock temperatures and the leaving water temperature were in good agreement with measured data. Other observations of importance are the bedrock up-lift as a consequence of thermal expansion. It was found that the maximum up-lift was 18 mm, compared to a theoretical value of 25 mm for a homogenous rock volume at actual temperature increase. The following subjects are dealt with in the paper: design and construction, research program, thermal functioning, and costs. 6 refs., 7 figs., 1 tab.

36214 (ITL–8509, pp. 480-484) **Storage of off-peak electrical energy in building floors with particular reference to resistance heating and heat pump systems.** Monaghan, P.F. (Univ. College, Galway, Ireland); O'Donnell, G.N. Intertask Ltd., Ottawa, ON (Canada). 1985. (In English and French). (CONF-850905–: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG–89-00267). In *Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This paper deals with storage of heat generated by off-peak electricity in concrete floors of buildings. Resistance heating cables and hot water piping are both considered. One- and two-dimensional finite difference models are used together with the ESP building energy simulation program to quantify the effects of: concrete thickness; position of heat generation cables or pipes; underfloor insulation; building thermal capacity; and floor coverings. Also considered are the effects of the off-peak charge period on energy storage, transient heat transfer to the building, concrete, cable and pipe temperatures, and heat loss to the ground. The major results are: both floor heating systems can provide adequate heat input to give recognized comfort levels in low energy buildings; and the parameters listed above can be manipulated to give different heat release cycles. In conclusion, the two off-peak electrical systems studied provide viable alternatives to conventional heating systems for low energy buildings. 8 refs., 7 figs.

36215 (ITL–8509, pp. 461-465) **Thermal energy storage in the energy ecosystem.** Hausz, W. (Eco-Energy Associates, Santa Barbara, CA, USA). Intertask Ltd., Ottawa, ON (Canada). 1985. (In English and French). (CONF-850905–: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG–89-00267). In *Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Thermal energy storage can reduce the cost of peaking equipment needed to produce, transport, and use each form of energy by matching the demand and supply for each energy form to reduce the peak output required, providing that the capital and operating costs of thermal energy storage are less than those of peaking equipment. Fuel costs may also be reduced when nuclear and coal fuels replace the alternative of using oil or gas. Thermal energy storage also facilitates serial use of energy when the several serial energy forms do not match in supply and demand. In late 1971, electric utilities faced increasing concern over increasing environmental problems and costs. Novel forms of energy generation, transport, storage, and use were evaluated to select promising technologies that should be developed. This project was the first to seriously suggest that aquifer thermal energy storage was a promising technology for seasonal storage. This paper is a resume and

re-appraisal of the role of thermal storage in these technologies and the potential benefits of their implementation. 11 refs., 2 figs.

36216 (ITL–8509, pp. 404-408) **Study of cool storage using refrigerant gas hydrate.** Akiya, T. (National Chemical Lab. for Industry, Yatabe, Ibaraki, Japan); Owa, M.; Nakaiwa, M.; Kawasaki, S.; Ishibashi, Y.; Ando, Y. Intertask Ltd., Ottawa, ON (Canada). 1985. (In English and French). (CONF-850905–: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG–89-00267). In *Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The aim of this study is to obtain basic data to develop a cool storage system that shifts the electrical demand for residential air-conditioning to off-peak period. At first, pressure-temperature phase diagrams of three refrigerant gas hydrates were determined. From the phase diagrams, the critical decomposition conditions and the heats of formation were calculated. Tests of formation-decomposition of gas hydrates were also carried out. From these test results it was found that the degree of supercooling for formation of hydrate depended on the previous heat treatment of the refrigerant-water mixtures. On the basis of these results, the cool storage system was designed conceptually. 11 refs., 11 figs., 2 tabs.

36217 (ITL–8509, pp. 426-431) **Analysis of a thermochemical energy storage system with liquid absorbents.** Bugaj, A.H. (Technical Univ. of Wroclaw, Wroclaw, Poland); Hahne, E. Intertask Ltd., Ottawa, ON (Canada). 1985. (In English and French). (CONF-850905–: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG–89-00267). In *Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This paper examines the use of liquid absorbents as a thermochemical storage medium. Parametric studies employed a model of simultaneous heat and mass transfer occuring in the system and an overall model of the system itself. During heat discharging operation the optimized energy turnover can easily exceed the value of 95%. The efficiency and energy storage density of the liquid absorbent/water system depends on the chosen operating concentrations of absorbent, which in turn depend on the input, output, charging, and discharging temperatures. Energy storage density ranges up to 1000 kJ/kg of solution. Charging operation of the particular system considered to the maximum concentration takes 200 hours with input energy being at 1000 kWh/ton of salt anhydrate. The useful heat energy extracted from the concentrated solution depends strongly on the temperature and humidity of discharging air stream. The practical energy storage density of the absorbent solution under the chosen conditions is 800 kWh/ton of salt anhydrate. 3 refs., 5 figs.

36218 (PNL–6797) **The aquifer chill storage project at the University of Alabama, Tuscaloosa: Progress report for 1985 and 1986.** Schaetzle, W.J.; Brett, C.E. Pacific Northwest Lab., Richland, WA (USA); Alabama Univ., University, AL (USA). May 1989. 75p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC06-76RL01830. Order Number DE89013764/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

Aquifer thermal energy storage (ATES) is predicted to be the most cost-effective technology for seasonal storage of low-grade thermal energy. Approximately 60% of the US is underlain with aquifers potentially suitable for underground energy storage. Under sponsorship of the US Department of Energy (DOE), Pacific Northwest Laboratory (PNL), which is operated by Battelle Memorial Institute, has managed numerical modeling, laboratory studies, evaluation of environmental and institutional issues, and field testing of ATES at several sites. This report describes the monitoring and evaluation (under the auspices of PNL) of an ATES chill system constructed and operated by the University of Alabama at Tuscaloosa, Alabama. The system is the first such system to be monitored in a comprehensive manner. Results support both the promise and problems likely to be encountered in such systems. Chill ATES has the potential to substantially reduce energy consumption and, especially, summer peak cooling electrical demand. However, the geohydrologic environment that the system will use must be a major element in system design and operation. 9 refs., 25 figs., 10 tabs.

36219 (AD-A–204877/5/XAB) **Investigation of polymeric solid-electrolyte cells, carried out during a nominal three-year period, focused on the rechargeable lithium battery. Final report, 15 July 1985-30 October 1988.** Owens, B.B. Minnesota Univ., Minneapolis, MN (USA). Corrosion Research Center. 23 Jan 1989. 5p. Available from NTIS, PC A02/MF A01.

The present study investigated solid state secondary lithium cell systems, especially Li/PEO,$LiCF_3SO_3$/V_6O_{13}. The material necessary to fabricate thin film (100-200 micron) cells were characterized and the behavior of the cells was investigated as a function of cycle number, humidity, overcharge, temperature and rate. Cell performance looked promising with continued cycling. Results were reported in twenty-one technical publications.

36220 (AD-A–204965/8/XAB) **Introduction to lithium batteries. General document.** Garrard, W.N. Materials Research Labs., Ascot Vale (Australia). Sep 1988. 14p. (MRL-GD–0018). Available from NTIS, PC A03/MF A01.

Lithium batteries are being introduced into all three services in the Australian Defence Force. However, general information concerning lithium batteries is not available in a condensed form. This review examines various aspects of lithium batteries, including battery technology, safety aspects, purchasing, packaging, transport, storage, and disposal.

36221 (CONF-8905175–1) **Accelerated life evaluation of valve-regulated lead-acid batteries.** DeLuca, W.H.; Miller, J.F. Argonne National Lab., IL (USA). 1989. 9p. Sponsored by EPRI;OUS. DOE Contract W-31109-ENG-38. From International lead-acid zinc research seminar; Orlando, FL, USA; 4-5 May 1989. Order Number DE89012429/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Valve-regulated lead-acid (VRLA) batteries are primarily used in standby and uninterruptable power source applications at present. Manufacturers expect these and/or similar VRLA batteries to provide a life of 1000–1500 cycles with deep discharging at operating temperatures of ~25°C. However, insufficient data are available to determine their suitability and life in such repetitive cycling applications. Argonne National Laboratory (ANL) has developed and initiated an accelerated life evaluation of VRLA batteries to acquire this data. The objectives of the ANL accelerated life evaluation are (1) to use accelerated testing techniques to obtain supporting evidence within 6 months that VRLA batteries have an expected life of more than 500 cycles in deep-discharge applications, and (2) to determine VRLA battery life within a 2–3 year time period under conditions (temperature and depth-of-discharge) that simulate those encountered in a utility operating environment. 3 tabs.

36222 (PB–89-166771/XAB) **Electrode-induced beta battery degradation. Final report.** Roberts, R.; Browall, K.W. General Electric Co., Schenectady, NY (USA). Corporate Research and Development Center. Nov 1983. 37p. Available from NTIS, PC A03/MF A01.

This report describes an investigation of sodium and sulfur electrode effects on beta-alumina ceramic electrolyte degradation. Specifically, four aspects were examined: (1) sulfur-electrode resistance contribution to overall cell resistance over time; (2) effects of calcium and potassium impurities in the sodium electrode on performance and cell life; (3) effect of air contamination on cell performance; and (4) evaluation of the sulfur electrode's chemical corrosivity on the ceramic. Calcium levels in excess of several hundred ppm led to severe pitting of the beta-ceramic. Addition of dry oxygen to the sodium compartment led to sodium oxide formation and a reduction in cell capacity, while wet oxygen introduction

caused rapid deterioration in cell performance and life. Dry nitrogen addition to the sodium compartment had no effect on either performance or resistance, while wet nitrogen had an effect similar to wet oxygen. Finally, it was found that preferential cycling in either the one- or two-phase region had no influence on beta-alumina surface degradation.

36223 **Electrode materials and processes for energy conversion and storage.** Srinivasan, S.; Wagner, S.; Wroblowa, H. 628p. The Electrochemical Society, Pennington, NJ (1987). (CONF-8705216–: 2. symposium on electrode materials and processes for energy conversion and storage, Philadelphia, PA, USA, 11-15 May 1987).

This book contains 47 selections. Some of the titles are: Towards new materials in energy conversion; Monte Carlo simulation of the electrochemical faceting mechanism; Alternating current electrolysis at semiconductor electrodes; Materials for fuel cells, 1977-1997; Analysis and interpretation of AC impedance data for porous electrodes; and Fuel cells for extraterrestrial and terrestrial applications.

29 ENERGY PLANNING AND POLICY

36224 (HQ–1988-VA) **Hydro-Quebec development plan, 1988-1990. 1997 outlook. Abridged version.** Hydro-Quebec, Montreal (Canada). 1988. 43p. (In French). (MICROLOG–89-01196). Available from Hydro-Quebec, Centre de diffusion, 75, boul. Dorchester ouest, 14e etage, Montreal, PQ, Canada H2Z 1A4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Hydro-Quebec, a Crown corporation incorporated in 1944, provides Quebec with electric power. It has 19,000 employees and $31 billion worth of assets. Its 80 power plants have a total capacity of 24.5 GW. In 1987, it sold 153 billion kWh of electricity, including 29 billion outside Quebec. This report is aimed at the shareholders, the main partners, and the employees of Hydro-Quebec, which defines the orientations, objectives, and strategies of the company. It deals with the coming ten years, but mainly with the decisions to be made during the next three years. The report summarizes the recovery measures of recent years, and discusses the condition of Quebec and external markets, the operation and development of installations, the management of human resources, the development of new technologies, and financial management. Also discussed are the interactions between the various strategies of Hydro-Quebec and the impacts of the company's activities on its partners and on the community. 12 figs., 12 tabs.

36225 (HQ–1988-VI) **Hydro-Quebec development plan, 1988-1990. 1997 outlook. Full-length version.** Hydro-Quebec, Montreal (Canada). 1988. 151p. (In French). (MICROLOG–89-01196). Available from Hydro-Quebec, Centre de diffusion, 75, boul. Dorchester ouest, 14e etage, Montreal, PQ, Canada H2Z 1A4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This plan is aimed at the shareholders, the main partners, and the employees of Hydro-Quebec. It defines the orientations, objectives, and strategies of the company and is intended to encourage co-operation for the beneficiation of hydroelectric energy in Quebec. Though it covers a 10-year span, the plan concentrates on the actions to be undertaken during the first three years, including the strengthening of the recovery actions that began in 1982. The objectives and strategies are essentially the same as in the previous plan. As previously, several scenarios of development have been considered. The uncertainties of the future of the economy, of the exchange rates of the Canadian dollar, and of petroleum prices illustrate the risks involved. The report first draws up a summary of the actions of the last years and of the "external context". It then discusses the marketing actions on Quebec markets and the resulting target of electricity demand, the strategies of external markets development, and the operation and development of installations. It gives an account of Hydro-Quebec's prospects in the fields of technology development and international affairs. It discusses human resource and financial management, especially the financial framework of the years 1988-1990. Finally, the report discusses the impacts of the considered strategies on Hydro-Quebec's partners. 33 figs., 35 tabs.

2901 Energy Analysis and Modeling

Refer also to citation(s) 36229, 36231, 36263, 36264, 36265, 36267, 36268, 36274, 36393

36226 (PNL–6920) **Review of second law analysis techniques applicable to the Energy Conversion and Utilization Technologies Thermal Sciences Program.** Drost, M.K.; Zaworski, J.R. Pacific Northwest Lab., Richland, WA (USA). Jun 1989. 30p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC06-76RL01830. Order Number DE89014580/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report describes a review of second law analysis emphasizing techniques applicable to basic research in the thermal sciences. Second law analysis is a class of thermodynamic analysis techniques that has become increasingly popular in the design of thermal systems. Pacific Northwest Laboratory conducted this review in 1987 for the US Department of Energy's (DOE) Energy Conversion and Utilization Technologies (ECUT) Program. The primary goal is to determine whether second law techniques can be used in guiding or contributing to basic research in the thermal sciences. 35 refs.

36227 (STC/SA–11) **Energy analysis of Canadian external trade, 1971 and 1976.** Hamilton, K.E. Statistics Canada, Ottawa, ON (Canada). Structural Analysis Div. 1988. 46p. (In English and French). (MICROLOG–89-02307). Available from Statistics Canada, Library, R.H. Coates Bldg., Tunney's Pasture, Ottawa, ON, Canada K1A 0T6; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Methodology and results are presented to show that Canadian exports (dominated by raw and semi-finished goods) were significantly more energy intensive than imports (dominated by manufactured goods) in both 1971 and 1976. The net surplus of export energy requirements over import energy requirements totaled 9% of domestic use of energy in 1971. Canadian intensiveness of energy use, as measured by the aggregate energy/GDP ratio, changed little over this period. Decomposition of commercial energy requirements per dollar of GDP reveals that final consumption patterns and direct energy use coefficients (the use of energy per constant dollar of production in each commercial sector) moved in the direction of increased energy intensity between 1971 and 1976; these effects were largely counteracted by shifts in the pattern of trade. 10 refs., 1 fig., 8 tabs.

36228 (DEA–1989) **Canada's new free trade agreement. Energy.** Department of External Affairs, Ottawa, ON (Canada). [1989]. 8p. (In English and French). (MICROLOG–88-01806). Available from Canada Dept. of External Affairs, Lester B. Pearson Bldg., 125 Sussex Dr., Ottawa, ON, Canada K1A 0G2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This pamphlet presents a brief overview of the economic impact of the energy industry in 1985, the future interaction between Canada and the United States under the Free Trade Agreement, and the methods used to deal with shortages, if they develop. It also addresses energy sovereignty, and the regional and national advantages of the agreement to the energy industry.

36229 (MU/ES–EC88-01) **General economic stimulation and energy indicators for capital investment initiatives in various transportation modes.** Allen, B.L.; Butterfield, D.W.; Kliman, M.L.; Kubursi, A.A.; Welland, J.D.; Kazakov, A. McMaster Univ., Hamilton, ON (Canada). Inst. for Energy Studies. 1988. 122p. (MICROLOG–89-02354). Available from Ont. Min. of Transportation and Communications, R & D Branch, 1201 Wilson Ave.,

Downsview, ON, Canada M3M 1J8; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

While capital spending by the Ontario Ministry of Transportation provides new and expanded transportation services and aids in maintaining the quality of the services already provided, it also has as secondary effects the generation of tax revenue and employment, the use of energy resources, and the production of income, both inside and outside the province. This report describes the development of a Transport Impact Model (TRIM), a comprehensive analytical tool to provide the Ministry with indicators of the secondary effects of its programs. TRIM is a self-contained, user-friendly program that runs on any IBM-compatible personal computer. The present version views the impacts of 35 pre-defined typical projects, either individually or in combination; provides adjustments of the assumptions made; and enables the user to insert specially defined projects. A given spending project is evaluated via a list of the goods and services that will be used in the project; this is entered into the model, which then calculates the effects of the project expenditures on a series of variables relating to the Ontario economy. The report also describes the thinking behind the model, sets out the variables that are calculated as indicators, and describes how the data that define a simulated project are constructed and entered into the model. Examples of the application of the model are also presented. The relationship between TRIM and MIES (Micro-Economic Impact Evaluation System), an earlier model, is also given. 15 tabs.

36230 (OME–1988, pp. 9) **Transferring technology. A social marketing perspective.** Lalungpa, S.D. (Passmore Associates International). Ontario Ministry of Energy, Toronto, ON (Canada). 1988. (CONF-880711–: Small hydro '88: international conference and trade show, Toronto, Canada, 4-9 Jul 1988;MICROLOG–89-02657;CE–02581). In *Small hydro '88. An international conference and trade show. Proceedings, vol. 2.* Available from Ontario Ministry of Energy, Communications Services Group, 62 Wellesley St., West, Main Floor, Toronto, ON, Canada M7A 2B7; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Given that small hydro offers itself as a small, community friendly, environmentally benign technology with considerable possibilities for decentralization, it may be useful to tap the body of knowledge and experience now available on development and technological transfer. The ideological basis for modernization has often been an enlightened paternalism, with development priorities set by donor organizations or central governments with little regard for the communities affected. The realization that the tools of marketing could be used to promote socially desirable ends is now defined as social marketing. According to Kotter, social marketing utilizes the concepts of market segmentation, consumer research, idea configuration, communication, facilitation incentives and exchange theory to maximize target response. Participation is recommended as promoting the triad of efficiency, equity and enprowerment.

36231 (SC/SES–23F) **Energy typologies. Energy expenditures of Canadians, 1969-1982.** Heslop, L.A. Statistics Canada, Ottawa, ON (Canada). Social and Economical Studies Div. 1986. 62p. (In French). (MICROLOG–89-02446). Available from Statistics Canada, Library, R.H. Coates Bldg., Tunney's Pasture, Ottawa, ON, Canada K1A 0T6; $5.00 CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

In order to deal with energy use patterns and lifestyles as a set of consumption decisions, an energy typology matrix was developed by dividing in-home and gasoline energy expenditures into high, medium and low levels. Data from the 6 Family Expenditure Surveys from 1969-82 are used to study the lifestyles of the occupants in each of 9 energy expenditure cells. These cells incorporate both expenditure categories and demographic characteristics. Further analysis of energy expenditures on a per capita, a per room and per room per 1000 degree day basis, and an analysis of insulation expenditures, provide information on the nature of energy expenditure increases and efforts to restrain them. The sample included only full-year households who were owners and renters of houses - detached, semi-detached, row, town - and who made payments directly for their energy. Energy conservation efforts are most evident among those with higher education levels and higher energy use levels. However, those with more limited resources have experienced larger relative increases in energy expenditures. 2 refs., 10 tabs

36232 (EPS–1988) **Reporting for the domestic substances list.** Environment Canada, Ottawa, ON (Canada). Environmental Protection Service. 1988. 111p. (In French). (MICROLOG–89-00931). Available from Environment Canada, Library Services, Terrasses de la Chaudiere, 10 Wellington St., Ottawa, ON, Canada K1A 0H3; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Within the framework of the "from cradle to grave" method of managing toxic substances, the provisions of the Canadian Environmental Protection Act pertaining to substances that are new in Canada ensure that no new toxic substance shall be introduced on the Canadian market before an assessment of its toxicity has been made by the appropriate ministries. For this purpose are established an interior list of substances, as well as an exterior list of substances that are used for commercial purposes in the rest of the world, though not yet in Canada. This report indicates which substances are to be declared, how to declare them, and what information is to be provided, in particular, place of manufacture and types of uses (fuel, fuel additive, etc). The report also lists the available documentary sources and discusses the questions pertaining to the confidentiality of the chemical formulation of a product. Appendices give a glossary of terms and a 7-page list of the most common chemical groups. 5 tabs.

36233 (UCRL–21175) **Lawrence Livermore National Laboratories Environmental Protection Department 1988 California legislative highlights.** Kahl Associates, Sacramento, CA (USA). Mar 1989. 12p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE89014806/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report contains a summary of state legislative activity that might impact on the environmental activities of the Lawrence Livermore National Laboratory. Topics include air quality, hazardous materials handling, liability, fees, and various legislative proposals. (TEM)

2904 Natural Resources

36234 (AE–1-252) **Alberta's energy and mineral resources.** Alberta Energy, Edmonton, AB (Canada). [1989]. 19p. (MICROLOG–89-02077). Available from Alberta. Dept. of Energy, Information Centre, Petroleum Plaza Tower, 9915-108 St., Edmonton, AB, Canada T5K 2C9; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This booklet outlines briefly the history, nature, and scope of conventional crude oil, heavy oil, oil sands, natural gas, coal, and other minerals, as well as the principles of resource management. Also included are a glossary of terms and significant dates in the development of the province's energy resources. 2 figs.

36235 (EC–1988) **Perspectives on land modelling. Workshop proceedings.** Gelinas, R. (ed.); Bond, D. (ed.); Smit, B. (ed.). Environment Canada, Ottawa, ON (Canada). 1988. 244p. (CONF-8611291–: Perspectives on land modelling, Toronto, Canada, 17-20 Nov 1986;MICROLOG–88-06350). Available from Environment Canada, Library Services, Terrasses de la Chaudiere, 10 Wellington St., Ottawa, ON, Canada K1A 0H3; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

A workshop was held to facilitate an exchange of information on the use of land modelling and the development of new modelling techniques, and to review progress in the field to date. A series of presentations on models in land resource planning and management stressed an integrated modelling approach. Presentations that concerned modelling the effects of climate change on the land resource base tended to focus on future trends and possibilities, while some presentations in the field of acid deposition impact assessment demonstrated how models can be used to fill information gaps and help understand what is occurring. Other areas covered included temporal and spatial models for natural resource management; land modelling applications; and priority issues, methods, and applications. Separate abstracts have been prepared for four papers from this workshop.

36236 (LA-UR–89-1605) **Central American resource studies.** Van Eeckhout, E.; Laughlin, A.W. Los Alamos National Lab., NM (USA). 1989. 12p. DOE Contract W-7405-ENG-36. (CONF-8903135–2: Costa Rica symposium, San Jose, Costa Rica, 6-9 Mar 1989). Order Number DE89012616/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Los Alamos National Laboratory has been working with five Central American countries to assist in the development of their energy and mineral resources. Since 1985, mineral resources in Costa Rica, peat resources in Costa Rica and Panama, geothermal energy resources in Honduras and Guatemala, and geothermal field development in El Salvador and Costa Rica have been topics of study. This paper presents an overview of this work – within these proceedings are papers that deal with specific aspects of each topic, and these will be duly noted. 15 refs., 4 figs.

36237 (PB–89-168462/XAB) **Potential supply of minerals from the White Mountains National Recreation Area and Part of the North Steese National Conservation Area Alaska. Appendix A- potential mineral supply analysis methodology.** White, B.A.; Gunther, T.M.; Johnson, R.; Adams, R.L. Bureau of Mines, Washington, DC (USA). Feb 1989. 376p. (BUMINES-OFR–12-89). Available from NTIS, PC A17/MF A01.

This report combines geologic, engineering, and economic analysis to estimate the quantity and value of minerals in undiscovered deposits in the White Mountains National Recreation Area and the Steese National Conservation Area in Alaska. The study was performed at the request of the Steese-White Mountains District Office, Bureau of Land Management, and will be used in a re-evaluation of current Resource Management Plans (RMP's). It was prepared by the Bureau of Mines, with geologic assessments from the U.S. Geological Survey, the Alaska Division of Geological and Geophysical Surveys, and the Bureau of Mines. The current RMP's restrict or prohibit access to eight types of mineral deposits. At mid-1987 prices, the effect of the RMP's is to reduce the expected quantity of gold produced by 112,000 ounces, with a market value of $50 million.

36238 (ACERR–1989) **Alberta/Canada Energy Resources Research Fund annual review, 1987-1988.** Alberta/Canada Energy Resources Research Fund, Edmonton, AB (Canada). 1989. 40p. (In English and French). (MICROLOG–89-02997;CE–02590). Available from Alberta Energy and Natural Resources, Information Centre, 9920-108 St., Edmonton, AB, Canada T5K 2M4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The Alberta/Canada Energy Resources Research Fund was created in 1976 between the governments of Alberta and Canada to promote and support the development and efficient use of Alberta's existing and potential energy resources to meet the province's and Canada's medium- and long-term energy needs; and to encourage the development of scientific and technical expertise in energy research, development and demonstration in Alberta. The program includes the production, transportation, conservation and utilization of both renewable and nonrenewable (fossil fuel) resources, generally excluding oil sands and heavy crude oil. This review highlights the research activities undertaken during the year. These include recovery of waste heat produced by the refrigeration system of a cattle-slaughtering and meat-packing operation, resulting in a payback period of only 15 months and substantial cost savings; installation of a heat recovery and water recycling system in two Calgary launderies, causing natural gas use to decline by up to 50%; the use of coal rather than natural gas as a fuel in steam operations in several oil sand/heavy oil regions of Alberta; and research programs at the Coal Research Centre at Devon, Alberta, the principal centre for coal research in Western Canada. A financial statement is included.

36239 (CANMET–87-8) **CANMET review 1986-1987.** Canada Centre for Mineral and Energy Technology, Ottawa, ON (Canada). 1988. 151p. (In English and French). (MICROLOG–89-01008). Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The Canada Centre for Mineral and Energy Technology conducts and supports research and development in the fields of mining and processing of minerals, coal, and oil sands, and their utilization. Technology transfer, information services, and support services are also part of the Centre's activities. This report reviews activities related to mining in general, coal and oil sands mining and preparation, mineral processing, fuels technology (including bitumen and heavy oil recovery, upgrading, and conversion of energy sources such as coal, natural gas, and biomass), and metals and materials. 14 figs., 1 tab.

36240 (CANMET–SP88-19) **CANMET Catalogue of publications, 1984/1985.** Canada Centre for Mineral and Energy Technology, Ottawa, ON (Canada). 1988. 95p. (In English and French). (MICROLOG–89-00959). Available from Canada Centre for Mineral and Energy Technology, Technical Information Division, 555 Booth St., Rm. 342, Ottawa, ON, Canada K1A 0G1; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

A comprehensive listing is provided of a total of 735 reports, journal articles, texts of oral presentations, and monographs related to research done or contracted by the Canadian Centre for Mineral and Energy Technology (CANMET) during 1984/85. The list is arranged into sections including CANMET reports, contract reports, and reports of CANMET divisions: Coal Research Laboratories, Energy Research Laboratories, Mining Research Laboratories, Mineral Sciences Laboratories, Office of Technology Transfer, and Physical Metallurgy Research Laboratories. Indexes are provided of authors, contractors, and subjects.

36241 (CONF-890659–1) **Negotiating a license to government technology.** Soderstrom, E.J. Oak Ridge National Lab., TN (USA). 1989. 10p. Sponsored by DOE Energy Research. DOE Contract AC05-84OR21400. From 14. annual meeting and international symposium of the Technology Transfer Society; Oak Ridge, Tennessee, USA; 13-16 Jun 1989. Order Number DE89014770/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This paper discusses reasons and methods for the commercialization of government research programs. Also covered are ideas expressing why a competitive edge is necessary for the USA in the world market place. (JEF)

36242 (CONF-890659–2) **Marketing for Oak Ridge technology transfer.** Prosser, G.A. Oak Ridge National Lab., TN (USA). 15 Jun 1989. 14p. Sponsored by DOE Energy Research. DOE Contract AC05-84OR21400. From 14. annual meeting and international symposium of the Technology Transfer Society; Oak Ridge, Tennessee, USA; 13-16 Jun 1989. Order Number DE89014766/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Martin Marietta Energy Systems, Inc., which manages major research and production facilities in Oak Ridge, Tennessee for the Department of Energy, has implemented a systematic approach to marketing for technology transfer. Unique mechanisms have been

created to address the need for market research and analysis, strategy formulation, and the execution of plans designed to engender the broadest commercial use of government-funded technologies. Establishment of formal ties with the University of Tennessee Graduate School of Business has resulted in an expanded role for marketing in support of the Oak Ridge program. The creation of graduate research positions has enabled MBA students to contribute to, and learn from, a program which is at the forefront of an important national initiative.

36243 (ITL–8509, pp. 396-403) **Heat storage R&D in The Netherlands.** van Mourik, G.J. (Management Office for Energy Research, Utrecht, The Netherlands). Intertask Ltd., Ottawa, ON (Canada). 1985. (In English and French). (CONF-850905–: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG–89-00267). In *Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Recently, the management structure of the R&D programs on energy conservation and renewables in The Netherlands has been changed. At present, a new-founded management office is responsible for all R&D programs. Energy storage is part of the geothermal energy and energy storage program. A detailed program to develop heat storage in aqifers is presently being undertaken. This paper discusses program funding and cost goals. 1 tab.

36244 (NRC–9014514) **Frontiers in chemical engineering: Research needs and opportunities.** National Research Council, Washington, DC (USA). Committee on Chemical Engineering Frontiers-Research Needs and Opportunities. 1989. 219p. Sponsored by DOE Fossil Energy. DOE Contract FG01-85FE60847. Order Number DE89014514/JAW. Available from NTIS, PC A11/MF A01 - OSTI; GPO Dep.

This report demonstrates that chemical engineering research will continue to address the technological problems most important to the nation. In the chapters that focus on these problems, many of the discipline's core research areas (e.g., reaction engineering, separations, process design, and control) will appear again and again. The committee hopes that by discussing research frontiers in the context of applications, it will illustrate both the intellectual excitement and the practical importance of chemical engineering. The research frontiers discussed in this report can be grouped under four overlapping themes: starting new technologies, maintaining leadership in established technologies, protecting and improving the environment, and developing systematic knowledge and generic tools.

36245 (ORNL–6541/V1) **Energy technology R and D: What could make a difference?: A study by the staff of the Oak Ridge National Laboratory: Part 1, Synthesis report: Volume 1.** Fulkerson, W.; Auerbach, S.I.; Crane, A.T.; Kash, D.E.; Perry, A.M.; Reister, D.B.; Hagan, C.W. Jr. (ed.). Oak Ridge National Lab., TN (USA). May 1989. 184p. Sponsored by DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89014568/JAW. Available from NTIS, PC A09/MF A01 - OSTI; GPO Dep.

The objective of this study was to survey both energy technologies and crosscutting areas of science and technology in order to identify important R and D needs and opportunities in the context of the US and world energy situations. The imperative for R and D was judged against its potential for fixing current energy system problems; for providing a robust set of options for coping with, taking advantage of, or encouraging future energy circumstances; and for creating unanticipated opportunities. 103 refs., 36 figs., 22 tabs.

36246 Providing incentives for effective technology transfer. Soderstrom, E.J. (Martin Marietta Energy Systems, Inc. Oak Ridge, TN (USA)); Prosser, G.A. *Forum for Applied Research and Public Policy (Knoxville, Tennessee)(USA),* 3(4): 6-14 (Win 1988).

Historically, attempts to transfer technology from the public to private sector have not worked well because individuals and institutions have not been motivated to make it work. While legislative acts and presidential decrees have created a more favorable legal/political environment, government research institutions must take initiatives to transform the intent of such actions into reality. Such initiatives must recognize that technology transfer is not a unidirectional transaction, but an exchange between two parties-one that enables each to benefit or profit. To motivate properly, the profit incentive must produce a tangible return on the investments made by both parties. Such an approach is consonant with the profit motive that undergirds the US economy. It is the basis for a technology-transfer program implemented by Martin Marietta Energy Systems, Inc. (Energy Systems), which manages and operates major research and production facilities in Oak Ridge, Tennessee, for the US Department of Energy. 22 references.

36247 (Juel-Spez–479) **Non-proliferation regime, vertical proliferation and the interests of the Federal Republic of Germany.** Fischer, W. Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Programmgruppe Technik und Gesellschaft; Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Forschungsgruppe Wirtschaft, Energie, Investitionen. Dec 1988. 171p. (In German). Order Number DE89788286/JAW. Available from NTIS (US Sales Only), PC A08/MF A01.

The disarmament orientation of the NPT, which stands beside the central aim of avoiding horizontal proliferation, raises a question: Does a compatibility exist between the non-proliferation policy of the Federal Republic and its security policy, which has its basic pillar in the nuclear deterrence strategy? Critics of this deterrence policy therefore, hinting to the disarmament determination of the NPT, demand that the Federal Republic should exercise its influence for the conclusion of a 'Comprehensive Test Ban Treaty' (CTBT), the establishment of a 'Nuclear-Weapons-Free-Zones' (NWFZ) in Europe, a 'No First Use'-Treaty (NFU) and finally the abolishment of all atomic weapons ('Zero Solution'). According to them such disarmament 'remedies' can reestablish or assure the waning or damaged international consensus for horizontal non-proliferation. This is a contribution for the establishment of a stable world order and will smooth the way for a prolongation of the NPT in the year 1995. An analysis of the history and the structure of interests shows that the policy of the Federal Republic of Germany is deeply rooted in the NPT and that a prolongation of the treaty and its own membership is a substantial object of the foreign and security policy. Consequently the Federal Republic has to face the demands for an intensification of 'anti-nuclear measures' and has to examine their acceptability and their usefulness with respect to non-proliferation. The structure of the problem encloses the following aspects: The security conception of the Federal Republic with its military-strategic essence; the provisions in article VI NPT for negotiations with the object of a world free of atomic weapons; the derived disarmament 'remedies' for strengthening the consensus for horizontal non-proliferation and, finally, the real interface between horizontal and vertical proliferation.

36248 (LBL-PUB–625-Vol.1) **Journal of Glenn T. Seaborg, Chairman of the US Atomic Energy Commission, 1961–1971: Volume 1, February 1, 1961–June 30, 1961.** Seaborg, G.T. Lawrence Berkeley Lab., CA (USA). c Jan 1989. 529p. Sponsored by DOE Energy Research. DOE Contract AC03-76SF00098. Available from Glenn T. Seaborg, Lawrence Berkeley Lab., Mail Stop 70-A-3307, 1 Cyclotron Rd., Berkeley, CA 94720.

This introduction to my journal of 1961–1971, covering my years of service as Chairman of the US Atomic Energy Commission, is written from the perspective of 1971, in order to reflect the attitudes expressed in my journal, which was written on a daily basis during that period. Thus, I express the points of view of that time rather than those of today (1988), which might occasionally be somewhat different. The journal consists of 25 volumes, averaging 700 pages each. This comprises about 15,000 items consisting of the approximately 4000 daily entries and the average of about three attachments per day. The journal has three sections corresponding to each of the three presidents I served as chairman of the Atomic Energy Commission – the first six volumes covering the John F. Kennedy years (February 1, 1961–November 22, 1963), the next 11

volumes covering the Lyndon B. Johnson years (November 22, 1963–January 20, 1969) and the final eight volumes, the Richard M. Nixon years and a few months of post-AEC chairman activities in Washington (January 20, 1969–November 6, 1971.)

36250 (EPRI-CU–6332, pp. 8.1-8.17) **Cogeneration in Europe.** van den Berg, J.M. Electric Power Research Inst., Palo Alto, CA (USA); Pacific Consulting Services, Berkeley, CA (USA). Apr 1989. (CONF-8804269–: International workshop on innovative DSM techniques, Palo Alto, CA, USA, 5-6 Apr 1988). In *International workshop on innovative DSM (demand-side management) techniques. Proceedings.* Order Number DE89011265/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Cogeneration is an interesting issue. Nearly all over the world, organizations in the electric power sector are concerned with aspects of cogeneration. Governments and regulators pay a great deal of attention to cogeneration, and as a consequence of the wishes and requirements of the governments, the electric utilities are involved in the issue as well. Nevertheless, the share of self-generation and cogeneration in electricity production is declining all over Europe, except in the Netherlands. The expectations for Europe are not very optimistic. As the combined production of heat and power can be an important long-term energy saving option, it is paradoxical that the prospects of introducing more cogeneration are so limited. Actually, these prospects are quite different for the various countries, and largely depend on the typical situation in each country. The possibilities for cogeneration to compete with the public sector are discussed.

36251 (EPRI-CU–6332, pp. 9.1-9.12) **Development of and outlook for cogeneration in the United States.** Gransell, H. Electric Power Research Inst., Palo Alto, CA (USA); Pacific Consulting Services, Berkeley, CA (USA). Apr 1989. (CONF-8804269–: International workshop on innovative DSM techniques, Palo Alto, CA, USA, 5-6 Apr 1988). In *International workshop on innovative DSM (demand-side management) techniques. Proceedings.* Order Number DE89011265/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

During the past decade, installation of cogeneration systems and other small power production facilities has increased rapidly in the United States. One significant piece of legislation, the Public Utility Regulatory Policies Act of 1978 (PURPA), had a tremendous impact on the development of this market. Through the federal government, PURPA mandated that electric utilities must purchase the energy produced from these cogenerators and small power producers at prices equal to their own avoided costs. In addition, PURPA removed several regulatory and institutional obstacles to developing cogeneration and small-power production, and provided economic incentives for equipment investment. As a result of PURPA, it became economically feasible for some commercial and industrial customers to generate electricity to meet their own needs, and where avoided costs are high, even sell electricity to local utilities. Most of the cogeneration (and small power production) projects implemented as a result of PURPA produce high thermal loads, which are very efficient and generally quite profitable. In some areas of the country, however, a different strategy has been adopted - one that takes advantage of utilities' high avoided costs. In these areas, cogeneration facilities that maximize electricity sales to utilities have been designed and implemented. These are often known as PURPA machines. The development of cogeneration facilities in the USA is discussed.

36252 (AD-A–205051/6/XAB) **Technology selection criteria and methodology for prioritizing energy research and development programs. Final report.** Windingland, L.M.; Teagan, P.; Frantzis, L. Army Construction Engineering Research Lab., Champaign, IL (USA). Jan 1989. 40p. (CERL-TR-E–89/06). Available from NTIS, PC A03/MF A01.

The U.S. Army Construction Engineering Research Laboratory (USACERL) has conducted an investigation into the development of an optimal strategy for selecting and prioritizing energy research and development (R&D) projects. This work is part of an ongoing effort to ensure that USACERL's R&D program includes an appropriate combination of new technologies for both short and longer term return on investment. The R&D goal is to provide the Army with the most-effective equipment and processes for conserving energy. Energy R&D work being conducted by various Governmental and private firms was reviewed and the methodologies for selection and prioritization of projects were analyzed. The processes require making judgments on key issues such as: probability of achieving performance goals; probable cost structures; commercial interest; status of competing technologies; and potential application of the technology. The existing approach taken at USACERL was compared with project selection methods of other Government and private organizations. Recommendations were developed for improving the selection criteria and methodology at USACERL.

36253 (DOE/IR/05106–T52) **Energy Task Force status report for first quarter year ten.** Urban Consortium for Technology Initiatives (USA). Energy Task Force. 1989. 152p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract FG02-78IR05106. Order Number DE89014845/JAW. Available from NTIS, PC A08/MF A01 - OSTI; GPO Dep.

This group of papers from the Urban Consortium Energy Task Force includes the following topics: community and economic development; energy and waste management; renewable energy sources; and alternate fuels for vehicles. (JEF)

36254 (DOE/IR/05106–T81) **Computer-assisted control for municipal water systems: Phase II, Implementation of a computer-assisted energy management program.** Lederer, C.C.; Thomas, A.H.; Davanzo, A.C. Urban Consortium for Technology Initiatives (USA). Energy Task Force. Jul 1988. 59p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract FG02-78IR05106. Order Number DE89013845/JAW. Available from NTIS, PC A04/MF A01 - OSTI.

This Phase II report will provide valuable input to both the Computer Control and Operation and Maintenance Manual projects in the areas of energy efficiency as it relates to the water distribution system. Based on examination of the current water distribution system layout, high lift pumping equipment performance and system control capabilities, three potential strategies for implementing energy conservation measures through computer assisted control were identified in the Phase I report. These strategies included preferential pump operation, redistribution of pressure districts and reduction of peak electrical demands.

36255 (NOVA–1989) **Community energy planner.** Diamond, L.; Cole, R.J.; Cooper, K.; Millbank, N. Nova, an Alberta Corp., AB (Canada). [1989]. 131p. (CE–02650). Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $ PRICES UPON REQUEST, FUNDS CAN.

This guide was written to help those who live in Canada's remote communities beyond a hydroelectric grid or natural gas line. The guide gives information on organizing for an energy plan; auditing the community for heat and electricity use; assessing available energy alternatives; and designing, installing, and operating the chosen energy systems. Case studies of various types of communities are included. Methods of measuring head and streamflow for small hydro installations are given, as well as solar and wind data. Suggested alternatives include the use of wood heat, passive solar heating, solar water heating, and the generation of electricity using small scale hydro installations, wind power, and photovoltaic installations.

36256 (DOE/EIA–0527(89)) **Assumptions for the annual energy outlook 1989.** USDOE Energy Information Administration, Washington, DC (USA). Office of Energy Markets and End Use. 23 Jun 1989. 51p. Sponsored by DOE Management & Administration. Order Number DE89014111/JAW. Available from NTIS, PC A04/MF A01 - GPO - OSTI; GPO Dep.

The purpose of this report is to present important quantitative assumptions, including world oil prices and macroeconomic growth, underlying the AEO forecasts. The report has been prepared in response to external requests, as well as analyst requirements for background information on the AEO and studies based on the AEO forecasts. 16 tabs.

36257 (EPRI-CU–6400) **Information and automation technology: Serving electric utility customers in the 1990s: Conference proceedings.** Electric Power Research Inst., Palo Alto, CA (USA); Policy Research Associates, Inc., Reston, VA (USA). c Jun 1989. 532p. Sponsored by Electric Power Research Institute. (CONF-881294–: Information and automation technology: serving electric utility customers in the 1990's, Scottsdale, AZ, USA, 5-7 Dec 1988). Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

These Proceedings contain written papers submitted by the speakers at the December 5–7, 1988 EPRI-sponsored conference Information and Automation Technology: Serving Electric Utility Customers in the 1990s. The purpose of the conference was to provide electric utilities with an overview of applications that rely on new and emerging information to enhance the value of electric service. There are 53 papers, organized into 10 subject areas corresponding to the sessions at the conference covering a broad range of information and communication technologies and electric utility applications. Three Appendices contain the conference agenda, the list of participants, and the list of exhibitors.

36258 (LBL–26260) **Proceedings of the Chinese-American symposium on energy markets and the future of energy demand.** Meyers, S. (ed.). Lawrence Berkeley Lab., CA (USA). Nov 1988. 275p. Sponsored by DOE Management & Administration. DOE Contract AC03-76SF00098. (CONF-8806261–: Chinese/American symposium on energy markets and the future of energy demand, Nanjing, China, 22-24 Jun 1988). Order Number DE89012862/JAW. Available from NTIS, PC A12/MF A01 - OSTI; GPO Dep.

The Symposium was organized by the Energy Research Institute of the State Economic Commission of China, and the Lawrence Berkeley Laboratory and Johns Hopkins University from the United States. It was held at the Johns Hopkins University Nanjing Center in late June 1988. It was attended by about 15 Chinese and an equal number of US experts on various topics related to energy demand and supply. Each presenter is one of the best observers of the energy situation in their field. A Chinese and US speaker presented papers on each topic. In all, about 30 papers were presented over a period of two and one half days. Each paper was translated into English and Chinese. The Chinese papers provide an excellent overview of the emerging energy demand and supply situation in China and the obstacles the Chinese planners face in managing the expected increase in demand for energy. These are matched by papers that discuss the energy situation in the US and worldwide, and the implications of the changes in the world energy situation on both countries. The papers in Part 1 provide historical background and discuss future directions. The papers in Part 2 focus on the historical development of energy planning and policy in each country and the methodologies and tools used for projecting energy demand and supply. The papers in Part 3 examine the pattern of energy demand, the forces driving demand, and opportunities for energy conservation in each of the major sectors in China and the US. The papers in Part 4 deal with the outlook for global and Pacific region energy markets and the development of the oil and natural gas sector in China.

36259 (NEB–23-15) **Canadian energy supply and demand, 1987-2005.** National Energy Board, Ottawa, ON (Canada). 1988. 429p. (MICROLOG–89-01285). Available from National Energy Board, Trebla Bldg., 473 Albert St., Ottawa, ON, Canada K1A 0E5; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This report presents projections of energy supply and demand, based on consultations with all provincial governments and a wide variety of industry and other interested parties, including utilities, associations, companies, research institutes, and various federal government departments and agencies. The consultations concerned methodology, assumptions as to world oil prices and economic growth, and preliminary projections. The report provides detailed information on the assumptions, methodology, and results of the analysis of supply and demand for natural gas, electricity, crude oil and equivalent, natural gas liquids, and coal. Details are given on resources and reserves, prices and costs, domestic demand, exports, production, and imports, as well as end use energy demand by sector and by fuel and region. A summary is included. Definitions, abbreviations, and terms used are also given. 79 figs., 104 tabs.

36260 (NEB–23-15) **Canadian energy supply and demand, 1987-2005.** National Energy Board, Ottawa, ON (Canada). 1988. 461p. (In French). (MICROLOG–89-01284). Available from National Energy Board, Trebla Bldg., 473 Albert St., Ottawa, ON, Canada K1A 0E5; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This report presents projections of energy supply and demand, based on consultations with all provincial governments and a wide variety of industry and other interested parties, including utilities, associations, companies, research institutes, and various federal government departments and agencies. 36261 (PB–89-161160/XAB) **Energy in West and Central Africa: issues, problems, and donor activities. Final report.** RCG/Hagler, Bailly, Inc., Washington, DC (USA). Jul 1988. 92p. (HBI-REF–88-4204). Available from NTIS, PC A05/MF A01.

Also pub. as Agency for International Development, Washington, DC. Office for Energy rept. no. REPT-88-12B.

The report is divided into four sections. Section 1 is the introduction. Section 2 presents an overview of the energy situation in the region and summarizes the key energy issues and problems that emerged from the literature review. Section 3 discusses the energy-assistance programs of major bilateral and multilateral donors. Section 4 makes some very preliminary and general recommendations for targeting A.I.D.'s energy activities in West and Central

Africa. A bibliography of sources consulted to prepare the report and a brief summary of the energy situation in individual countries for which information was available are included. These country summaries are generally based upon the ESMAP energy assessments.

36262 (PB–89-173264/XAB) **GRI (Gas Research Institute) baseline projection summary. Final report.** Yanchar, J.M. Data Resources, Inc., Lexington, MA (USA). Oct 1982. 127p. Available from NTIS, PC A07/MF A01.

The GRI annual baseline projection of U.S. energy supply and demand provides a consistent framework of data which is used in planning GRI's R&D program. The summary of the baseline projection to the year 2000 discusses energy prices (oil, natural gas, coal and electricity) and energy demands in the residential and industrial sectors (including life-cycle costs, new investments and stocks, and energy consumption). Numerous tables provide detailed energy supply and demand data broken down by factors such as energy types, demand sectors, and geographical regions.

36263 (PB–89-180962/XAB) **GRI (Gas Research Institute) 1983 baseline projection forecast summary. Final report.** Yanchar, J.; Wright, C. Data Resources, Inc., Lexington, MA (USA). U.S. Energy Service. Dec 1983. 92p. Available from NTIS, PC A05/MF A01.

See also PB–89-138622 and PB–89-180996.

The Gas Research Institute (GRI) annual baseline projection of U.S. energy supply and demand provides a consistent framework of data which is used in planning GRI's R and D program. The summary of the baseline projection to the year 2000 discusses the macroeconomic outlook, energy prices (oil, natural gas, coal, and electricity) and energy demands (residential, commercial, industrial, transportation, and electric utility). Numerous tables provice detailed energy supply and demand data broken down by factors such as energy types, demand sectors, and geographic regions.

36264 (PB–89-180970/XAB) **GRI (Gas Research Institute) 1983 baseline project forecast methodology and assumptions. Final report, November 1983.** Yanchar, J. Data Resources, Inc., Lexington, MA (USA). U.S. Energy Service. Nov 1983. 113p. Available from NTIS, PC A06/MF A01.

See also PB–89-181002.

The Gas Research Institute (GRI) annual baseline projection of U.S. energy supply and demand provides a consistent framework of data which is used in planning GRI's R and D program. The report discusses the forecast assumptions and model methodology used in generating the 1983 baseline projection. Included is an explanation of the DRI Energy/Economic Modeling System, which is composed of five models: DRI Macroeconomic Model of the U.S. Economy, DRI World Oil Model, DRI Energy Core Model, DRI/Zimmerman Coal Supply and Distribution Model, and DRI Drilling Model.

36265 (PB–89-180988/XAB) **DRI (Data Resources Inc.) Energy Model/GRI (Gas Research Institute) Hydrocarbon Model and IFCAM linkage. Final report, September 1983.** Yanchar, J.M.; Smalley, G. Data Resources, Inc., Lexington, MA (USA). U.S. Energy Service. Sep 1983. 35p. Available from NTIS, PC A03/MF A01.

See also PB–89-181010.

The Gas Research Institute (GRI) annual baseline projection of U.S. energy supply and demand provides a consistent framework of data which is used in planning GRI's R&D program. The report discusses two procedures which were used in generating the 1983 baseline projection: (1) natural gas availability and pricing data derived within the DRI Energy Model based upon production and price inputs from the GRI Hydrocarbon Model; and (2) fuel price and industrial production forecasts generated by the DRI Energy Model/ IFCAM Linkage.

36266 (PB–89-180996/XAB) **GRI (Gas Research Institute) 1984 baseline projection forecast summary. Final report.** Yanchar, J.; Wright, C. Data Resources, Inc., Lexington, MA (USA). U.S. Energy Service. Feb 1985. 99p. Available from NTIS, PC A05/MF A01.

36269 (DOE/IG–0008/10-7) **Office of Inspector General semiannual report to the Congress, October 1, 1988–March 31, 1989.** USDOE Office of Inspector General, Washington, DC (USA). May 1989. 35p. Sponsored by DOE Management & Administration. Available from OSTI.

The semiannual report of the Office of Inspector general for the 6-month period ending March 31, 1989, meets the requirements of Section 208(c) of Public Law 95-91, as amended. Our audit, inspection, and investigative activity during this period continued to focus on identifying opportunities to enhance the effectiveness, efficiency, and integrity of the Department of Energy's programs and operations. Special emphasis was given to the planning and initiation of projects to review and evaluate the Department's activities relating to environmental, safety and health matters. Implementation of corrective action on the conditions summarized in our reports should help in achieving improvements throughout the Department. On reports where a final Departmental position was received, management committed to more efficient use of funds totaling $309.5 million. The report details the accomplishments of OIG for the first half of Fiscal Year 1989. The report is organized into four major sections. The first section presents an organizational overview of the varied missions and functions of the Department of Energy. The second section describes the significant operational results of our audit, investigative, and inspection activity. The third section discusses the OIG actions during the past 6 months to support Presidential and congressional concerns, and the final section presents an organizational overview of the Office of Inspector General and describes the major management initiatives within our office to build on past accomplishments and to increase the effectiveness and efficiency of our operations.

36270 (OE–1987) **A Citizen's guide to environmental assessment.** Ontario Ministry of the Environment, Toronto, ON (Canada). 1987. 16p. (MICROLOG–89-03973). Available from Ontario Government Publications, 880 Bay St., 5th Floor, Toronto, ON, Canada M7A 1N8; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This guide offers a general introduction to environmental assessment in Ontario. It explains the requirements of the Environmenal Assessment Act and its implications, as well as the opportunities for public involvement throughout the process. Explanations are given for individual environmental assessments, hearings, class environmental assessments, exemptions, designations, and the Environmental Assessment Advisory Committee. A list of contacts and resources relating to the Act is also given. 8 refs.

36271 (SEEDS-DP–39) **Energy privatisation.** Littlechild, S.; Price, C.; Robinson, C.; Sykes, A. Surrey Univ., Guildford (UK) . Energy Economics Centre. Jun 1988. 18p. (CONF-8803164–: Conference on energy privatisation, Guildford, UK, 2 Mar 1988). Available from British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

This report consists of two full papers and two summaries of papers presented at a conference which examined the already accomplished and prospective privatization of the energy industries in the United Kingdom. The areas covered in the papers are the general principles of privatization, an evaluation of the success of British Gas, a critique of the proposals for electricity privatization and an examination of the case for coal privatization. A common thread running through the papers is the perceived desirability of introducing competition into naturally monopolstic enterprises and discussion of the mechanisms for achieving this. (U.K.).

36272 (SEEDS-DP–39, pp. 1-7) **Why British coal should be privatised.** Robinson, C. (Surrey Univ., Guildford (UK)). Surrey Univ., Guildford (UK) . Energy Economics Centre. Jun 1988. (CONF-8803164–: Conference on energy privatisation, Guildford, UK, 2 Mar 1988). In *Energy privatisation.* Available from British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

It is argued that liberalization rather than privatization per se should be the priority of a denationalization programme. A change from state to private ownership may provide a measure of capital market discipline for management which may be more effective than government control, but this alone is likely to have only a modest effect. Competition is an essential element in any ownership scheme in order to establish efficiency standards and to stimulate changes which, in general, are of benefit to the consumer. The substitution of a private monopoly for a state monopoly in the coal industry would produce few, if any, gains for consumers. In the light of what has already happened in the gas industry, what is proposed for the electricity supply industry and the implication for the closely linked coal industry, there is a danger that the United Kingdom government's energy privatization programme will merely result in the substitution of three private monopolies for three state monopolies. (U.K.).

36273 (SEEDS-DP–39, pp. 8-15) **Lessons from gas privatisation.** Price, C. (Leicester Univ. (UK)). Surrey Univ., Guildford (UK) . Energy Economics Centre. Jun 1988. (CONF-8803164–: Conference on energy privatisation, Guildford, UK, 2 Mar 1988). In *Energy privatisation.* Available from British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

The structure of the privatized British gas industry and the regulatory rules under which it operates are examined and evaluated against the yardstick of managerial and economic efficiency. The broad conclusions reached are that the monopolistic character of the structure of British Gas and the partial aspects of the chosen regulatory scheme, make the maximization of efficiency unlikely. In the light of experience it is suggested that more time should have been allowed for the discussion of structure and the regulatory regime. The industry should have been privatized as a number of smaller local monopolies with all their activities subject to regulation. Such a horizontal split of the industry would have generated some within industry competition and tighter regulation based on more information could have provided greater managerial efficiency. (U.K.).

2960 Electric Power

Refer also to citation(s) 35874, 36250, 36251, 36256, 36257, 36344

36274 (CONF-8906146–1) **The value of marginal analysis in electric power system operations.** Katzman, M.T.; Shelton, R.B. Oak Ridge National Lab., TN (USA). 1989. 15p. DOE Contract AC05-84OR21400. From 21. Latin American conference on rural electrification; Guatemala City, Guatemala; 5-6 Jun 1989. Order Number DE89013550/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Electric utilities have traditionally based their calculation of costs and derived prices on the basis of averages. Marginal analysis provides an alternative method of costing and price setting. Not only does marginal analysis yield different computations, it can lead to different and more efficient decisions. This point is illustrated by the evaluation of biomass cogeneration to a utility and the costing of rural extensions. 7 refs., 3 figs., 3 tabs.

36275 (EPRI-CU–6300, pp. 1-5) **Pricing electric power and services in a dynamic marketplace.** LeBlanc, W.; Smith, W.; Chamberlin, J. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Innovative pricing arrangements to sell electric power and services are discussed. Innovative pricing embraces the idea of offering flexible services that reflect a dynamic business environment. Pricing is one of the most powerful tools that a company can use to promote its overall marketing strategy. Utilities can no longer consider pricing as simply a means to gather necessary revenue. Marginal, avoided, outage, and competitor costs, customer value tradeoffs, and load shape objectives all must play a major role in new pricing strategies. Many utilities are already experimenting with forms of innovative pricing, such as negotiated and unbundled rates. This reflects the significant changes occurring in the electric industry. With downward pressure on fossil fuel prices and increased competition, customers are demanding more flexible energy supplies; improvements in cogeneration technology are making self-supply an option for more customers; and gas deregulation and price restructuring are increasing the competitiveness of gas with electricity for many traditional electric only markets. From the utility's standpoint, many objectives can be addressed through pricing strategies. These pricing strategies are discussed.

36276 (EPRI-CU–6300, pp. 7-14) **Innovative pricing of electricity.** Kahn, A.E. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Historically, public utility regulation has given primary attention to the total revenues that the utility companies were entitled to receive – to defining the rate base and ascertaining the proper rate of return. Specific rates tended to be based on averages, on full allocations of aggregate revenue requirements, with a large component of embedded costs – in all of these respects diverging widely from what either profit maximization or economic efficiency would have dictated. An innovative method for pricing electricity is described.

36277 (EPRI-CU–6300, pp. 15-16) **From rates to prices: the emerging concepts.** Smith, W.M. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Contemporary influences on the electric utility business environment call for an evolution of thought and perspective regarding the pricing of electric service. Factors like unregulated suppliers of electricity, natural gas deregulation, demand forecasting uncertainties, and risks associated with large capital purchases require increased flexibility in utility business planning and operations, and greater focus on the customer as a key element in electric supply and demand. While the traditional cost basis (embedded, marginal, etc.) must still play a major role, the use of prices as a tool to effect greater market penetration and customer response to a utility's selection of electric services has begun to emerge as a key element in utility planning. New pricing methods offer tremendous potential for utilities to effectively address the needs of the electric marketplace. By concentrating on particular customer circumstances, instead of on rates set solely upon cost factors, great strides in increased service value and efficient utilization can be realized. Some emerging concepts on the pricing of electricity are discussed.

36278 (EPRI-CU-6300, pp. 17-20) **Electricity pricing: a new role for an old concept.** Endries, J.M. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323--: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Some thoughts on how Niagara Mohawk views innovative pricing are presented. There are greater pressures today to develop better ways to package and price electric power. Many of the same economic arguments were advanced in the late 1970s when utilities were ordered to implement marginal cost pricing to promote efficiency in the production and consumption of electric power. Foremost among these forces of change is increasing competition in electricity markets. What's new about innovative pricing and making the transition from rates to prices are discussed.

36279 (EPRI-CU-6300, pp. 23) **New dimensions in marginal cost concepts.** Hanser, P. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323--: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Although utilities have calculated marginal costs even before the advent of the Public Utilities Regulatory Policy Act (PURPA), they have not been thought of as particularly useful. Utilities cannot make profitable pricing decisions without a clear understanding of costs, particularly incremental, or marginal, costs. Good managers know how costs will change with the changes in sales that result from pricing decisions. The key is identifying the relevant costs. The important costs are those that are forward-looking, incremental, and avoidable, i.e., marginal costs. However, in practice, an identification based on these criteria can be difficult. The development of marginal cost pricing concepts is discussed.

36280 (EPRI-CU-6300, pp. 25) **Customer outage costs: their role in system planning and pricing.** Kirsch, L.D. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323--: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Customer outage costs are very important. One reason is they provide a measure of the benefits of investments that improve the reliability of electric service. A second reason is that they are essential for estimating the costs that customers impose on other customers during periods when power systems may be unreliable. How accurate outage cost measurement can improve system planning processes; and why it is efficient for customers to pay electricity prices that are partly based on the costs that customers themselves incur during outages are explained.

36281 (EPRI-CU-6300, pp. 35-36) **Marginal operating costs: is system lambda enough?.** Stremel, J. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323--: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Hourly marginal costs play an important role in ratemaking and in other pricing policies for electric utilities. Measurements of hourly system lambdas often play an important role in determining costs for pricing policies. How system lambda is measured and its implications are discussed.

36282 (EPRI-CU-6300, pp. 39) **Competitive pricing and regulatory reform.** Willig, R.D. (Princeton Univ., NJ (USA)). Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323--: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Utility ratemaking has historically been based upon embedded accounting costs. But it is widely recognized that embedded accounting costs often do not follow closely the cyclical patterns of current marginal costs. Current competitive pressures on the industry are forcing a fresh look at innovative pricing proposals that give less weight to embedded costs and more to marginal costs. The benefits of moving toward innovative pricing based on marginal costs are reviewed and some regulatory approaches to the challenges that lie in the path to implementation of innovative pricing in the electric utility industry are discussed.

36283 (EPRI-CU-6300, pp. 41) **Price differentiation by time and by service.** Chao, H. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323--: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The two broad thrusts of innovative pricing are compared, i.e., pricing by time, which includes a variety of options from standard TOU to spot pricing and pricing by service quality, which includes the full range of price differentiation by attributes such as reliability and quality. Taken together, time and service differentiation generate a menu of offerings that provides the basis for enhancing customer and utility value. Such a menu approach to time and service differentiation is the subject of a multidisciplinary EPRI study, referred to as Priority Service Methods, or PRISM. This presentation, which lays the framework for subsequent sessions, identifies the principles that distinguish time and service differentiation, discusses some examples of each, and comments on current research.

36284 (EPRI-CU-6300, pp. 43) **Strategic integration of pricing and demand-side management.** Chamberlin, J.H. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323--: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The increasing interest in developing rate structures and strategies for use as tools to influence customer actions raises concerns about consistency between rates and demand-side management (DSM) programs. Rates do not just provide incentive customers to shift load or adopt new technologies. They also strongly influence the attractiveness to both customers and the utility of other DSM efforts. The role of rate structure in DSM cost-effectiveness analysis is discussed. For several of the major cost-effectiveness tests, rate structures have a major influence in the selection of particular programs. Improper rate structures can lead to the selection and design of DSM programs which do not further the interests of either the utility or its customers. How rate strategies and DSM programs can be consistently planned and developed, utilizing equivalent evaluation approaches are discussed.

36285 (EPRI-CU-6300, pp. 45-46) **Rate manager's perspective: theory to practice.** Wharton, J.B. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323--: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

There is no concept closer to the heart of economics than the price of goods and services. Setting innovative rates for electric service is a fertile ground for applied economic science. During the past two years, the New England Electric System (NEES) has launched a major thrust in new rates and monetary incentives to encourage conservation and load management. This includes TOU rates, interruptible rates, end use rates, real time pricing and conservation and load management grants. For all of these programs, NEES has sought to establish a strong theoretical foundation consistent with business philosophy. NEES business philosophy is to maintain profitability by cost containment, resource diversity, customer satisfaction and good regulatory relations. NEES approach to innovative rate design is discussed.

36286 (EPRI-CU-6300, pp. 49-50) **Forecasting day-ahead marginal costs.** Krantz, M. (Niagara Mohawk Power Corp., Syracuse, NY (USA)). Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323--: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Niagara Mohawk's Hourly Integrated Pricing Programs provides participating industrial customers with hourly energy prices, one day in advance. This experimental rate covers the customers' contribution to the utility's fixed costs through an access charge; hourly energy prices are based directly on the utility's forecast hourly marginal cost. Hourly marginal costs have two components, marginal operating cost (which is primarily fuel) and marginal outage cost (which reflects the impact of a load increment on the reliability of supply). Since Niagara Mohawk is a member of the New York Power Pool (NYPP), it was originally proposed to estimate hourly marginal costs by modifying techniques that NYPP uses for security constrained dispatch (SCD). The problems that made that approach impractical to implement are discussed.

36287 (EPRI-CU-6300, pp. 51) **Validating marginal cost estimates.** Kahn, E. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323--: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Marginal energy costs are forecast using production simulation models. The California Public Utilities Commission (CPUC) has been directed by the state legislature to validate the use of these models. The CPUC implemented this direction by undertaking extensive backcasting studies. The most substantial of these compared the performance of PROMOD and ELFIN in replicating the operating experience of Southern California Edison (SCE) in 1985. The variation in SCE marginal cost in this period was principally determined by the availability of low-cost economy energy from the Southwest, and minimum load constraints on the SCE oil and gas system. The validation study required extensive analysis of the economy energy transactions entered into by SCE. Accounting conventions governing the reporting of these transactions are complex and not always consistent. Some of the most important data, involving rejected economy energy, was of poor quality. Translating available data into modeling conventions required judgment. The difference between reasonable approximations and model-specific hard-wiring was not always clear to participants. The process of validating these marginal cost estimates is discussed.

36288 (EPRI-CU-6300, pp. 53) **Measuring outage probabilities.** Sullivan, R.L. (Univ. of Florida, Gainesville (USA)). Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323--: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

A discussion of commonly used component reliability models and system reliability analyses is presented. Further discussion of the parameters involved, how they are defined, and how they are measured are presented. A summary of current reliability measuring techniques and reliability data collection efforts are discussed.

36289 (EPRI-CU-6300, pp. 57) **Competition and bypass in regulated markets.** Spulber, D.F. (Univ. of Southern California, La Canada (USA)). Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323--: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The effects of bypass and partial deregulation on the rate structure of regulated firms are examined using a market model. The possibility of introducing competition without bypass through shared ownership, access rights and vertical divestiture is assessed and compared to rate-of-return regulation. A cost test for determining the desirability of vertical integration is applied to an examination of vertical divestiture of transmission facilities.

36290 (EPRI-CU-6300, pp. 59-60) **Pros and cons of negotiated rates.** Wicks, J. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323--: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Negotiated rates and individual customer contracts are not unduly discriminatory per se, nor are tariff rates inherently free of undue discrimination. As a practical matter, though, special contracts appear so conspicuously discriminatory that regulatory resistance to individual ratemaking ensures that the practiced will be proscribed. Tariff offers, however contrived the eligibility criteria, enjoy a cosmetic advantage over individual contracts; yet poorly designed tariffs may be equally discriminatory and more pervasively damaging. The advantages and disadvantages of negotiated rates are discussed.

36291 (EPRI-CU-6300, pp. 61) **Strategies to meet increased competition.** Hansen, D.P. (San Diego Gas and Electric Co., CA (USA)). Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323--: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

A discussion of rate strategies must start with a description of recent electric rate history. In the 70's embedded cost rate designs gave way to marginal cost designs in California. The marginal cost based designs adopted in California recovered large portions of fixed utility costs in volumetric energy rates. The purpose of these designs was to foster conservation and self-generation at any cost. Under competitive pressure these bundled designs gave way to a return to cost based rates emphasizing proper price signals for each component of service. A similar situation occurred with cost allocations. During the oil embargo years the Commission sought to shield residential customers from rate shock by allocating disproportionate amounts of rate increases to the industrial classes. In part, SDG&E's solution to this problem was to cost base and unbundle. This is a process of removing inter-class subsidies and of charging rates that accurately reflect the cost of each component of service. In addition, new tools have come into play which can be used by the utility to increase competitiveness. These tools run the gamut from individual negotiated rates to optional commercial tariffs to utility supported load control programs such a TES. These strategies are discussed.

36292 (EPRI-CU-6300, pp. 65) **Assessing the value of service reliability.** Walther, R.J. (Southern California Edison, Rosemead, CA (USA)). Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323--: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Increasingly, electric utilities are asking themselves how do our customers value the reliability of our service. At Southern California Edison Company, a multi-step program both to assess the value of service reliability and to make use of the information developed was undertaken. The focus of this presentation is on the development of value of service reliability information. The presentation begins with

a review of the value of service reliability concept and the alternative measurement approaches. A description of the steps being followed at Southern California Edison Company to assess the value of service reliability to the customers in presented. These steps include a Scoping Study, Preliminary Measurement Studies, Customer Survey, and Customer Case Studies. In reporting on these activities, special attention is given to the design and implementation of the two Customer Surveys, which are nearing completion.

36293 (EPRI-CU-6300, pp. 67) **Derivation of service values from surveys.** Doane, M.J. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323--: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Contingent valuation methods involve asking individuals in survey or experimental settings to reveal their personal valuations of increments (or decrements) in unpriced goods using contingent markets (if this happened what would you be willing to pay?). Surveys employing this technique have been used to measure the welfare gains attributable to improvements in air and water quality and, more recently, to estimate the value of electric service reliability (i.e., the cost of power outages). The use of contingent valuation methods in the context of measuring outage costs is discussed. An emphasis is placed on survey design issues (e.g., the framing of contingencies) and appropriate methods for data analysis.

36294 (EPRI-CU-6300, pp. 69) **Estimating outage costs from demand analysis.** Caves, D.W. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323--: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Although the importance of outage costs for planning and pricing is becoming widely recognized, reliable estimates of outage costs continue to price elusive. Survey-based approaches are relatively inexpensive and quick to implement, but their results are difficult to verify. No one knows the extent to which customers actual behavior will reflect their responses to hypothetical survey questions. The major alternative - analysis of market data - is based on actual behavior, but has been plagued by lack of suitable market data. Recently, however, new programs have begun to produce data that would shed light on customer outage costs. The data that are becoming available for obtaining outage cost estimation is reviewed and ways by which the utility industry can maximize the value of the information gained from market-based approaches are suggested.

36295 (EPRI-CU-6300, pp. 83-90) **Revenue and rates of return requirements.** Christensen, L.R. (L.R. Christensen Associates, Inc., Madison, WI (USA)). Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323--: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Advanced pricing systems, such as priority service or real-time pricing are important tools for achieving the benefits associated with marginal cost pricing. But since marginal resource costs are often substantially different from average embedded costs, advanced pricing systems can lead to revenue collections that are substantially different from traditional revenue requirements. Because the revenue requirement remains a keystone in the utility ratemaking structure, some mechanisms must be found for achieving reconciliation between marginal cost based rates and the revenue requirement. The two major approaches to revenue reconciliation are usage-based and usage-independent methods. This presentation compares and contrasts these methods in terms of their implications for economic efficiency, net revenue stability, equity, and customer acceptance. Existing real-time pricing projects are reviewed in the context of the approach to revenue reconciliation.

36296 (EPRI-CU-6300, pp. 91-92) **Demand charge: does it fit in?.** Kleindorfer, P.R. (Univ. of Pennsylvania, Philadelphia (USA)). Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323--: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Two issues related to demand charges are considered. First, what arguments can be provided for and against the use of demand charges for industrial and large commercial consumers? Second, do demand charges have a place in innovative pricing of electricity? The advantages and disadvantages of demand charges in general are discussed with respect to innovative pricing proposals. The bottom line to the analysis is that demand charges are of continuing importance for standing rate schedules for industrial and commercial consumers, but they are not appropriate ingredients of real-time prices. For real-time pricing, demand charges do not advance the cause of efficiency for either the customer or the utility.

36297 (EPRI-CU-6300, pp. 93) **Innovative pricing: do benefits outweigh costs?.** Flaim, T. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323--: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Assessing the benefits and costs of innovative pricing concepts is necessary to both design new rates and to determine whether they should be implemented. The results of the assessment that was conducted for Niagara Mohawk's Hourly Integrated Pricing Program (HIPP) are presented. HIPP is a form of real-time pricing that has been developed at Niagara Mohawk for industrial customers. It features hourly energy prices that are forecast one day in advance and a monthly access charge to handle reconciliation between revenues and embedded costs.

36298 (EPRI-CU-6300, pp. 97-98) **Technological requirements for new pricing strategies.** Reddoch, T.W. (Electrotek Concepts, Inc., Knoxville, TN (USA)). Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323--: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

One important consequence of new pricing strategies is an inherent escalation in information management requirements. Implementation requirements are a significant departure from historical methods of costing, pricing, metering, and billing of electricity. However, customer participation is increased through the need to better understand the rate program, understand the use of modern technology and its relationship to the rate, and a greater need to interact with the utility and its representatives. The primary requirement for the overall technology configuration for implementing new electricity pricing strategies is a combination of hardware and computer software carefully fabricated to provide an interactive system between the utility and the customer. The major elements of the pricing system are presented.

36299 (EPRI-CU-6300, pp. 99-100) **Options for broadcasting price & information.** Abbott, R.E. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323--: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The delivery of pricing information to the utility customer is a basic requirement of many more advanced flexible or dynamic rate structures. Indeed, the efficacy of many suggested rates structures depends heavily on the existence of communications media and enabling technology which delivers the information to customers reliably, without errors and at a justifiable cost. Large industrial and commercial accounts, with their high associated revenues, permit more choices in communications technologies. At the other extreme, dissemination of prices to residential customers severely tests the use-economics of any technology. In that cost-sensitive environment of residential customer applications, compromises on equipment design, fabrication, installation and operation are

inevitable. These necessary compromises, in turn, may not yield adequate reliability and accuracy. An overview of technologies is presented which have been or are being used for disseminating and retrieving information from customer premises, including AM and FM broadcast and VHF radio, ripple, distribution power line carrier, and others. The technologies which are emerging as candidates for the coming decade and beyond, including satellite, fiber, ISDN, derived channel telephone, cable and others are discussed.

36300 (EPRI-CU–6300, pp. 101) **Working systems from off-the-shelf components.** Eppolioto, P. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Several variable pricing system configurations have been developed and implemented by utilities. These systems consist primarily of components typically available as off-the-shelf that have been integrated to satisfy the needs of a particular variable pricing program. Typical off-the-shelf components consist of both hardware and software. In particular, personal computers with supporting peripherals like monitors, printers, modems, and solid state metering systems constitute available hardware. Software packages including Lotus, R-Base, D-Base, metering master station operating systems, etc. have been used. Communication between customer and the utility have used dedicated telephone lies, with methods such as electronic mail or conventional direct modem transactions. The primary value of utilizing off-the-shelf components is to reduce the development time for the RTP system and to improve reliability. Three RTP system configurations are analyzed to explore how such systems have been successfully configured. Niagara Mohawk Power Corporation's Hourly Integrated Pricing Program (HIPP) system configuration is discussed. In particular, the individual system elements are described, and the links connecting the elements of the systems presented. Further, system implementation for Pacific Gas and Electric and Southern California Edison are summarized.

36301 (EPRI-CU–6300, pp. 105-106) **Customer response to real-time pricing.** Crane, C.M. (Pacific Gas and Electric Co., San Francisco, CA (USA)). Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Demand-Side Real-Time Pricing (RTP) is an innovative and viable pricing experiment at PG&E since its inception in 1984. It provides customers with another rate option and benefits the Company because the daily hourly prices accurately reflect PG&E's cost to serve. The response of the 15 PG&E program participants in the program to real-time pricing is presented.

36302 (EPRI-CU–6300, pp. 107) **Exploring new dimensions in RTP.** Fagan, J. (Southern California Edison Co., Rosemead (USA)). Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Southern California Edison Company's (SCE) current Real-Time Pricing Experiment and Spot Pricing programs are described. Both programs test the use of real-time pricing information on customers, but each has different goals. SCE's Real-Time Pricing Experiment focuses on testing customer response to simulated real-time prices. This experiment is currently under way for ten of SCE's largest commercial and industrial customers. A wide range of continually varying prices is transmitted to these customers. Normally, prices are provided well in advance of when they are charged. SCE's Spot Pricing Program seeks to encourage incremental on-peak sales through use of a discounted rate. All incremental on-peak sales are fully interruptible. The rate which applies to these additional sales is initially set at a fixed minimum rate level, but is subject to escalation in real-time if: (1) marginal energy costs increase substantially; or (2) a shortage of capacity is imminent. Customers are also subject to a number of provisions which discourage their shifting of load to the on-peak period or adding surplus load on-peak.

36303 (EPRI-CU–6300, pp. 119-120) **Two-part pricing in real-time.** Tramutola, T. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Niagara Mohawk is conducting research to measure customer response to a unique version of real time pricing - a two part rate which facilitates pricing energy at short-run marginal cost. Confronted with other utilities' limited success in attracting real time pricing customers and with concern over whether or not RTP is economically and technically possible, Niagara Mohawk developed a unique rate design for their Hourly Integrated Pricing Program (HIPP) which offers revenue neutrality on a customer specific basis. Customer recruitment in established RTP program has suffered from distorted price signals and from the use of energy price adders or multipliers. Niagara Mohawk is offering large industrial and commercial customers marginal cost-based pricing on an hourly basis. The two-part rate design maintains customer specific revenue neutrality with respect to existing time-of-use rates with respect to their historically established consumption pattern, referred to as the customer baseline load.

36304 (EPRI-CU–6300, pp. 123-129) **Pricing innovation and latent technology development: the chicken and egg syndrome.** LeBlanc, W. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Latent technology is technology which would exist if pricing was set through competitive market forces (or marginal costs, to a lesser extent) instead of regulatory statutes. Only recently has the trend increased toward offering prices which vary by season and time of day. In addition, cross subsidies between customer classes and between customers themselves have given improper price signals to the majority of electric power consumers. These price signals have placed a perverse set of incentives for technological development related to the industry. The Chicken and Egg Syndrome refers to the question: Do new technologies create the need for expanded service options, or does the need for new pricing mechanisms (such as TOU pricing) create openings for new technologies? Technology arrives from both directions. The vast majority of new electrotechnologies evolve just like most products. A need is recognized, existing knowledge is packaged in a new way of incrementally improved, and buyers are willing to pay a higher price for a better product. Entrepreneurs and big companies alike recognize and capture these technology markets.

36305 (EPRI-CU–6300, pp. 131) **Modifying process operations in response to innovative pricing.** Stern, K.M. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The concept of industrial load shaping is explored from both fundamental and practical perspectives. Application of industrial load shaping to the following industries is discussed. Examples of successful past projects are discussed along with the ingredients necessary to achieve additional future successes.

36306 (EPRI-CU–6300, pp. 133-142) **Using variable prices to improve productivity.** Smith, D.A. (Water Pollution Control Facility No. 16, North Tonawanda, NY (USA)). Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The water pollution control industry, often in the forefront of the on-going program to protect and rehabilitate our environment, would appear to be an unlikely prospect for energy conservation and experimentation. Yet, it is an industry which expends between one-fourth and one-third of its total operating costs on electric power, with the larger plants spending in excess of $1 million per year. As such, these largely public sector operations should be thought of as prime targets for innovation. To affect this, however, power industry incentives must be coupled with management rethinking in the wastewater industry; for ingrained in most environmental managers is the conservative caveat that redundancy, reliability and past practice should remain preeminent. Using a large operating wastewater treatment facility as an example of what may be accomplished, an evaluation of the impact of various pricing inducements is examined. The facility involved, the Town of Amherst Water Pollution Control Facility, is currently experimenting with several forms of energy conservation/innovation. These forms of energy conservation are discussed.

36307 (EPRI-CU–6300, pp. 145-154) **Incentives for residential direct load control.** Noell, S.K. (Southern California Edison Co., Rosemead (USA)). Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Southern California Edison has pioneered many of the existing methods for designing, communicating and testing rate and service options. An overview of Edison's experience in measuring and influencing customer attitudes toward direct load control is presented. The presentation focuses on the incentives used to encourage customer participation. Edison's energy management portfolio has included several air conditioner cycling test programs, a rapid program expansion, and the current, stable production environment. The concept of whole house load control has been extensively explored through the DEMAND SUBSCRIPTION SERVICE Test Program. Designed incentives, marketing plans, and operational procedures have been accomplished while considering customer preferences and needs. The measurement of customer needs and preferences is inherent to test and production program management. Analyses of focus groups, surveys, response rates, attrition, and load research all contribute to the comprehensive, interdisciplinary, flexible approach that has evolved at Southern California Edison.

36308 (EPRI-CU–6300, pp. 155-163) **Rate manager's perespective: theory to practice.** Wharton, J.B. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

In 1987, the New England Electric System (NEES) responded to an approaching period of capacity tightness by launching its Cooperative Interruptible Service program for above 200 kW C&I customers. The success of this type of dispatchable load program depends on an artful combination of rate design, marketing, operations and monitoring. The focus was on the rate design where NEES made an innovation on previous designs. The innovation was motivated by the findings of an EPRI research project on innovative pricing which was conducted by Christensen Associates. A participant's load factor was revealed to be a prime determinant of the relationship between the amount of load actually shed and the load credited in the standard contract. The solution was to factor each participant's load factor into the tariff's credit calculation. This approach makes the tariff more efficient and more fair. Other aspects of the design and implementation of interruptible rates are summarized.

36309 (EPRI-CU–6300, pp. 165-175) **GPU's experience with curtailable loads.** Sweeney, L.E. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The operating companies of the GPU System have utilized curtailable rates for more than 20 years. In the mid-sixties the curtailable concept was introduced via a contract for a single large air-reduction customer. Curtailments were triggered in order to avoid setting a new annual peak. The GPU System now serves some 70 customers, with curtailable loads ranging in size from as small as 0.3 MW up to as large as 120 MW. The value/pricing theory has remained relatively constant over the years. However, some tariff provisions have been modified to enhance the service as the need arose. The basic curtailable provision provides compensation on the basis of 20 curtailments per annual period with a cumulative 150 hours of curtailment. One operating subsidiary of GPU offers extended off-peak billing hours if the customer agrees to: (1) curtail 40% of its connected load and (2) curtail an additional 6 times for 45 additional hours.

36310 (EPRI-CU–6300, pp. 179-180) **Efficiency vs. fairness retail pricing.** Bidwell, M.O. (National Economic Research Institute, White Plains, NY (USA)). Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

This discussion is divided into two sections. The first section explains why there is a simple answer to the equity versus efficiency controversy. The second section explains why there are not simple answers. The simple answer to the equity versus efficiency controversy is that one should always to with efficiency. There are many reasons for taking this position. Unlike equity, efficiency is definable and measurable. Moreover, economic efficiency is part of a general result in a field called welfare economics. The economically efficient result can be shown to maximize the total amount of goods and services that can be produced using the scarce resources available. This particular result can be extended to situations where the regulated revenue requirements does not equal the revenues that would be collected if all prices were set at marginal cost. In this regulated situation, the use of Ramsey pricing provides maximum economic welfare and greatest possible efficiency.

36311 (EPRI-CU–6300, pp. 181-202) **Market segmentation and pricing for competitive markets.** Camfield, R. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Both industry insiders and outside observers point to a major change in the focus of electric utilities; namely, that the industry is becoming more competitive with fairly intense interest in marketing. Contemporary electricity markets, moreover, now contain substantial elements of competition from alternative sources of power, new technologies, and adjacent central station suppliers. Thus, segments of electricity markets can be rendered contestable. Long enjoying monopoly power, electric suppliers and their regulatory agencies need to evaluate current pricing policy with reference to these intensified competitive pressures. Two pricing options are presented. First, the electric supplier can segment markets and reprice consistent with the principle of inverse elasticity rule, sometimes referred to as quasi-optimal, or Ramsey pricing. It is shown that the efficiency gains of Ramsey prices are best achieved when applied to specific market segments. Often, the inverse elasticity rule is considered only within the context of class prices, and without regard to substantial differences in price sensitivity within classes. Secondly, the incumbent electric supplier can engage in flexible pricing with negotiated rates. A loss minimizing policy, flexible pricing mitigates lost market share in those market segments wherein customers have opportunities to substitute to alternative suppliers. These two pricing systems are not necessarily exclusive; both strategies may be necessary to sustain market share within a contestable market environment.

36312 (EPRI-CU–6300, pp. 203-213) **Regulatory perspective on interruptible rates.** Tierney, S.F. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30

Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Under certain price and contractual terms and conditions, interruptible contracts with customers can offer electric companies a cost-effective, flexible and innovative way to obtain capacity within a relatively short planning and development lead time. From a regulatory perspective the offering of interruptible rates and contracts to obtain cost-justified, firm, dispatchable interruptible power ought to be part of a utility's supply tool kit, particularly in circumstances where the utility's projected available capacity over the next few peaking seasons is expected to be tight vis-a-vis its projected load and reserve requirements. Certain regulatory principles are discussed for evaluating the pricing and other terms and conditions of interruptible contracts as appropriate for inclusion in a utility's least-cost,, integrated resource plan.

36313 (EPRI-CU–6300, pp. 217) **Marketing rates that enhance net revenue.** Herriges, J. (Laurits R. Christensen Associates, Madison, WI (USA)). Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

There is a growing interest in the electric power industry in developing a variety of rate and service options. The concept of offering a single good (i.e., kWh) at a single price is being replaced by an array of tariffs that differentiate electricity according to its quality attributes, including time-of-day, level of reliability, voltage level and geographical location. By offering a menu of rate options, utilities can achieve a better match between customer demand and the costs of producing electricity. The problem with rate menus arise when the tariff options do not reflect the cost of service. In many instances, voluntary rate programs enable individuals to obtain the same service at a reduced rate. Rather than leading to a more efficient usage of electricity, customer self-selection can result primarily in a redistribution of wealth, with volunteers enjoying benefits financed by non-volunteers. The problem of revenue erosion and/or redistribution that can result from voluntary Time-of-Use (TOU) and Interruptible/Curtailable Rate programs, as well as the potential for alleviating this problem through careful program design and marketing is discussed.

36314 (EPRI-CU–6300, pp. 219-234) **Importance of market segmentation in new service and rate offerings.** Caves, D.W.; Herriges, J.A.; Windle, R.J. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Among the underlying characteristics of Integrated Value-Based Planning (IVP), and the closely related Priority Service Concept (PRISM), is the principle that customers be given a selection or menu of price and service offerings. The advantage of these schemes, in principle, is that they encourage changes in usage patterns that lead to a closer match between the marginal cost of service and the value of service to individual customers. But in practice the menu characteristic can cause the serious side-effect of net revenue erosion for the utility. This occurs when a segment of the customer population is able to select one of the new offerings and obtain a considerable bill reduction without making any change in usage patterns. Because the problem arises only for segments of the population, market segmentation research may provide a way to minimize the damage.

36315 (EPRI-CU–6300, pp. 235-243) **Effects of voluntary TOU rates on revenues.** Goett, A.A. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The revenue impact of voluntary time-of-use (TOU) rates is a central issue surrounding their design and promotion by electric utilities. Voluntary tariffs may cause revenue attrition that must be recovered through increases in other rates or lost through decreased profits. Recent theoretical work on public utility pricing has shown that if there are no costs to administer a voluntary tariff, it is possible to design such a rate that increases net revenues. However, with positive administration costs, the practical feasibility of designing a voluntary rate that increases revenues and that appeals to a significant portion of customers depends on the distribution of customer characteristics in the population. The participation, load, and revenue impacts of several alternative voluntary TOU rates were investigated using a fairly general model of customer demands by time-of-use and the results of a recent study of customer response to a voluntary TOU rate experiment at Pacific Gas and Electric Company (PG&E). It was found that many rates that both increased gross revenues and were economically attractive to a significant percentage of residential customers. A smaller number of economically attractive rates increased net revenues based on estimates of metering, program administration, and generation costs from PG&E. The properties of these rates relative to the marginal costs of electricity and the distribution of demand elasticities in the customer population were investigated.

36316 (EPRI-CU–6300, pp. 245-252) **Influencing customer investment through financial incentives.** Miedema, A.K. (Research Triangle Institute, Research Triangle Park, NC (USA)). Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Financial incentive programs can significantly affect the price of services that electricity provides through their effects on the cost of efficient technology investments. In that sense they are electricity pricing options. The costs and benefits of such program options must be carefully weighed. A framework for such an assessment is presented and the available evidence on the impact of factors that affect both costs and benefits is described. Those factors are grouped into those that influence customer adoption (investments), those that affect electricity usage after adoption, and important external conditions. The evidence suggests the need for caution and thoughtful evaluation before proceeding with new programs. The final section offers specific implications of the available evidence for the process of planning and designing financial incentive programs.

36317 (EPRI-CU–6300, pp. 255-262) **Electricity - raw material.** Keierleber, D.P. (Liquid Carbonic Industrial Medical Corp., Chicago, IL (USA)). Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Electricity represents as much as 70% of the total operating expenses of an air separation plant. Since air is free, final site selection for a new plant depends heavily on the cost of the real raw material - electricity. The decision to build a new plant (which will have a 10,000 - 15,000 kW demand with a 98% load factor) could be for new business growth; but, it could also be a purely cost reduction decision to shutdown an existing facility and relocate in a less expensive power grid.

36318 (EPRI-CU–6300, pp. 263-274) **Taking charge of electricity costs.** Malatzky, A. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Large, electricity intensive, industrial customers require greater flexibility and innovative approaches from their suppliers if they are to survive and grow. The grouping of these customers as Industrial fails to take into account the vast differences within that class. Utilities and regulators need to be aware of and sensitive to these

differences and to be responsive by allowing risk and experimentation. If a utility does not understand its markets and fails to move aggressively to meet the needs of the market, it will lose sales. Market knowledge requires that individual utility companies learn from the source, the customers. Utilities and regulators need to listen and to learn. They can no longer simply price their product without regard to customer needs and expect their customers to buy. Utilities and regulators need to work with their customers to develop rates and contracts that support, rather than hinder, their large customers.

36319 (EPRI-CU–6300, pp. 275) **Large industry's view of innovative pricing.** Noble, R.A. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Large manufacturing companies, beset by competitors inside and outside the US, find it necessary to reduce or hold down costs, increase product quality, and give more service to customers. In doing so, these companies - particularly those for whom energy is a major raw material - focus increasingly on energy costs, and look for flexibility and accommodation from their suppliers. In response, many utilities, with cooperation from state public service commissions, are developing innovative new pricing and incentive strategies. A number of these are examined and viewed from the point of view of a major power user. Free-market and regulated industries coexist in a friendly, dependent, but uneasy relationship. Sympathetic attention by each to the needs and goals of the other can result in mutually satisfactory solutions.

36320 (EPRI-CU–6300, pp. 279-280) **Power quality: a utility perspective.** Mason, R.S. Jr. (Bayboro Corp., St. Petersburg, FL (USA)). Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The advent of the microprocessor, and its subsequent proliferation throughout the world, has both enhanced and complicated the lives of all of us. Almost everything we do, whether at home or at work, involves a microprocessor in one way or another. But unlike machinery of the past and the inventions of Edison, the microprocessor is highly sophisticated and extremely sensitive, tolerating little or no power abnormalities. Microprocessor failures are caused by a variety of sources, including the environment and even other equipment. In the commercial sector, more than 80 percent of all computer-based equipment problems are caused by the customers themselves. Customers seeking solutions to microprocessor operating problems have been looking to a variety of sources for help, but more and more are now turning to their electric utilities since these are the people who supply the electricity needed to operate the devices.

36321 (EPRI-CU–6300, pp. 281) **Guaranteed rates: a marketable option?.** Sergel, R.P. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Non-price factors are critical to the marketing of any product. Not every customer is looking to buy bread at the lowest price. Likewise, for electric customers, price is just one of many important product attributes. Guaranteed Rates are designed for customers who desire price stability over a three to twelve month period. Three different aspects of the guaranteed rate option were evaluated. First, the characteristics of customers who have expressed an interest in guaranteed rates were reviewed. Second, regulatory considerations concerning this type of ratemaking were examined. In particular, the allocation of the risk/rewards associated with guaranteed rates was evaluated. Finally, the use of rate contracts to implement guaranteed rates was considered. The overall conclusion is that guaranteed rates provide an attractive opportunity for both the utility and its customers.

36322 (EPRI-CU–6300, pp. 283) **Attributes of simplicity in pricing.** Engel, D.C. Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Today's competitive environment has accelerated the interest in innovative rate designs to better mirror customer needs and interests. Utilities have responded with unbundled and more complex rate structures and contract mechanisms. Yet the competition is marketing their products based upon simplified and stabilized cost comparisons relative to the uncertainty and complexity of utility rates over time. The need to balance rate design innovations with pragmatic marketplace considerations is discussed. Some of these considerations include: rate applicability to a sufficient customer segment, level of customer sophistication, marketing/sales staff comprehension, and internal implementation constraints.

36323 (EPRI-CU–6300, pp. 287-298) **Cogeneration and competition.** Cicchetti, C.J. (Harvard Univ., Boston, MA (USA)). Electric Power Research Inst., Palo Alto, CA (USA). Apr 1989. (CONF-8809323–: Conference on new dimensions in pricing electricity, Syracuse, NY, USA, 28-30 Sep 1988). In *New dimensions in pricing electricity. Proceedings.* Order Number DE89010357/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

This year marks the tenth anniversary of the enactment of the Public Utility Regulatory Policies Act of 1978 (PURPA). As it passed through Congress, the electric utility industry and its critics thought they were debating legislation that would profoundly change electric utility regulation in the United States. Ironically, these participants were correct in their assessment of the consequence of PURPA, but for the wrong reason. It was not the much heralded marginal cost pricing and tariff reform aspects of PURPA which became the seeds for the subsequent regulatory reform. Instead, it was the nearly overlooked section 210 dealing with cogeneration which has had the most profound effect on the electric utility industry. The effects of PURPA on the cogeneration industry are discussed.

36324 (EPRI-CU–6332, pp. 1.1-1.8) **Introduction: demand-side management – a fundamental part of utility planning.** Hanser, P. Electric Power Research Inst., Palo Alto, CA (USA); Pacific Consulting Services, Berkeley, CA (USA). Apr 1989. (CONF-8804269–: International workshop on innovative DSM techniques, Palo Alto, CA, USA, 5-6 Apr 1988). In *International workshop on innovative DSM (demand-side management) techniques. Proceedings.* Order Number DE89011265/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

In 1984, EPRI published a report that stated that a key challenge to the electric utility industry in the 1980s will be the successful integration of traditional supply planning and operation with the emerging concept of demand-side management. It is clear now, near the end of the decade, that the report was correct. The concept of demand-side management is no longer emerging. It has reached maturity, measured by the level of success demand side management (DSM) programs have had. DSM has emerged as one of the most powerful techniques available to utility planning staffs. Given the rapid transformation of the power markets over the past few years, the skillful integration of DSM with supply-side management no longer seems such a futuristic concern. It has become essential to the long term health of the industry. The concept of demand-side management is simple: to influence customer use of electricity for the mutual benefit of both customers and the utility. Implementing DSM programs turns out to be somewhat complex. There are five major components to demand-side management, some of which have more than one part. The complexity stems from the inherent flexibility of well-conceived DSM programs as well as the comprehensiveness of the structure under which they are developed and operated. The five components of DSM are discussed.

36325 (EPRI-CU–6332, pp. 10.1-10.20) **Alternative technologies for DSM in the commercial sector.** Blatt, M. Electric Power Research Inst., Palo Alto, CA (USA); Pacific Consulting Services,

Berkeley, CA (USA). Apr 1989. (CONF-8804269–: International workshop on innovative DSM techniques, Palo Alto, CA, USA, 5-6 Apr 1988). In *International workshop on innovative DSM (demand-side management) techniques. Proceedings.* Order Number DE89011265/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The commercial sector in the United States is the fastest growing market segment of electric utility industry and it is subject to intense competition, primarily from the gas industry. There is competition for loads that have traditionally been electric loads - such as space cooling and refrigeration loads - that are now being threatened by cogeneration and other gas-fired equipment. There are also opportunities in market segments where there has traditionally been competition, and the gas industry is now making greater efforts that could cause the market share of electricity to decrease. These loads are space heating, water heating, and cooking. How energy is used in the commercial sector in the United States is shown. This is all the energy consumed at the point of use; adding up to about six Quads. Space heating is by far the biggest use of energy in the commercial sector. Some alternative technologies to demand side management in the commercial sector are discussed.

36326 (EPRI-CU–6332, pp. 12.1-12.9) **Motivations for and evolution of DSM.** Smith, W.M. Electric Power Research Inst., Palo Alto, CA (USA); Pacific Consulting Services, Berkeley, CA (USA). Apr 1989. (CONF-8804269–: International workshop on innovative DSM techniques, Palo Alto, CA, USA, 5-6 Apr 1988). In *International workshop on innovative DSM (demand-side management) techniques. Proceedings.* Order Number DE89011265/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The motivation for beginning a demand-side management (DSM) in the electric utility industry is explored. The kinds of end-use technologies to employ in DSM are discussed. These technologies include direct load control of appliances, interruptible/curtailable rates for large commercial and industrial customers, time-of-use rates for load shifting, and promotion of new electricity uses.

36327 (EPRI-CU–6332, pp. 13.1-13.9) **Institutional aspects of DSM in France.** Rabut, P. Electric Power Research Inst., Palo Alto, CA (USA); Pacific Consulting Services, Berkeley, CA (USA). Apr 1989. (CONF-8804269–: International workshop on innovative DSM techniques, Palo Alto, CA, USA, 5-6 Apr 1988). In *International workshop on innovative DSM (demand-side management) techniques. Proceedings.* Order Number DE89011265/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

A short description of the Electricite de France (EDF) tariff evolution, focused on its links with demand-side management is presented. Information is given on which utilizations are affected by changes in tariffs and whether they influence peak clipping (knocking off the peaks, with a loss in the total sales of energy), load shifting (shifting the consumption to a different time), and valley filling (filling up the load curve during off-peak periods, with an increase in the total sales of energy). These issue are discussed in terms of both daily and seasonal energy use patterns.

36328 (EPRI-CU–6332, pp. 14.1-14.21) **Institutional aspects of DSM in Italy.** Camplani, A. Electric Power Research Inst., Palo Alto, CA (USA); Pacific Consulting Services, Berkeley, CA (USA). Apr 1989. (CONF-8804269–: International workshop on innovative DSM techniques, Palo Alto, CA, USA, 5-6 Apr 1988). In *International workshop on innovative DSM (demand-side management) techniques. Proceedings.* Order Number DE89011265/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

ENEL's institutional task is to provide the country with an electricity supply commensurate with its development requirements at the minimum cost. In performing this task, the ENEL Board of Directors approved the program of January 14, 1988, which takes into account the new situation of the country, and particularly the parliamentary resolution of December 18, 1987. Under this resolution the government undertook to submit a new PEN (National Energy Plan) along specified guidelines. The planning horizon of ENEL programs is the year 2000, I.E., thirteen years from now. Considering the long lead-time of base-load power plants, this horizon is a minimum one to gain insight into evolution of the sector and formulate an investment program for the 1988-1992 five-year period, as required by the parliament. The goals of ENEL programs are discussed.

36329 (EPRI-CU–6332, pp. 15.1-15.17) **Demand-side management in the Federal Republic of Germany.** Schaefer, H. Electric Power Research Inst., Palo Alto, CA (USA); Pacific Consulting Services, Berkeley, CA (USA). Apr 1989. (CONF-8804269–: International workshop on innovative DSM techniques, Palo Alto, CA, USA, 5-6 Apr 1988). In *International workshop on innovative DSM (demand-side management) techniques. Proceedings.* Order Number DE89011265/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The very general topic of demand-side management can be subdivided into the subjects of load management, strategic conservation, and load growth, load management being by far of the greatest importance in practical operation. For this reason, the ways and means as well as the results of load management in the Federal Republic of Germany are described.

36330 (EPRI-CU–6332, pp. 16.1-16.7) **Institutional aspects of DSM in the United States.** Smith, W.M. Electric Power Research Inst., Palo Alto, CA (USA); Pacific Consulting Services, Berkeley, CA (USA). Apr 1989. (CONF-8804269–: International workshop on innovative DSM techniques, Palo Alto, CA, USA, 5-6 Apr 1988). In *International workshop on innovative DSM (demand-side management) techniques. Proceedings.* Order Number DE89011265/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

In the United States, more experimentation has been done than implementation of actual programs with a wide variety of activities. There has been a lot of interest in rate treatments, i.e., time-of-use rates and interruptible/curtailable rates. There are thermal energy storage programs, rebates for efficient appliances, and instances of whole towns working on some kind of conservation or load management objective to shift or reduce energy use. One of the key areas is that of monitoring. In the United States, most utilities bill on a monthly basis. Many customers with demand as low as ten kW have demand metering as well as energy use metering. Time-of-use metering, in both mandatory and optional programs, has become widespread. There are hundreds of thousands of customers on time-of-use rates around the country. Many utilities are now monitoring residential load shapes, commercial load shapes, and industrial load shapes at the facility or whole-building level, and many, because they have implemented direct load control and other things like that, have actually monitored end uses. So there are data on what those air conditioners look like when they are operating in commercial or residential establishments. There is information on what the water heaters look like in residential establishments, and there are a number of other kinds of things like dishwashers, dryers, and electric space heaters being monitored.

36331 (EPRI-CU–6332, pp. 17.1-17.7) **Discussion on planning and DSM.** de Voghel, L. Electric Power Research Inst., Palo Alto, CA (USA); Pacific Consulting Services, Berkeley, CA (USA). Apr 1989. (CONF-8804269–: International workshop on innovative DSM techniques, Palo Alto, CA, USA, 5-6 Apr 1988). In *International workshop on innovative DSM (demand-side management) techniques. Proceedings.* Order Number DE89011265/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Planning for the implementation of demand-side management programs in the electric utility industry is discussed. Now there is a new approach - strategic planning - which takes into account the interaction of demand and supply. This new approach to demand-side management is discussed under the following topics: the role of corporate organizations, long-term DSM planning, using DSM to achieve corporate goals, and balancing the mismatch between supply and demand.

36332 (EPRI-CU–6332, pp. 2.1-2.19) **Alternative rate design in the United States.** LeBlanc, B. Electric Power Research Inst., Palo Alto, CA (USA); Pacific Consulting Services, Berkeley, CA (USA). Apr 1989. (CONF-8804269–: International workshop on innovative DSM techniques, Palo Alto, CA, USA, 5-6 Apr 1988). In *International workshop on innovative DSM (demand-side management) techniques. Proceedings.* Order Number DE89011265/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

An overview of alternative rate designs in the United States is presented. Conditions in America that are driving rate designs right

now are discussed. The traditional view of rate design is that there is a certain amount of revenue that needs to be collected from all the kWh sold. The total revenue requirement is based on an allocation of cost-of-service (COS) from which some level of rates is determined. The traditional focus has been on the recovery of costs; always looking at the money one needed to collect. Many utilities are starting to take a different look at how they are pricing electricity on a customer-by-customer basis. They are looking at what their profit targets are; what the utility wants to accomplish in the way of profits. They need to maintain market share. At the same time, there is more competition - alternative sources of electricity of American customers. A key distinction of the strategic view of pricing is that it focuses on what the market condition are as opposed to what the revenue requirements are. This gets a little more complicated. The utility tries to hit the bulls-eye and the path is anything but a straight line. There are equity issues with respect to the customers who do not have choices, such as residential and small commercial customers. There are regulatory concerns, which are very important in the United States; they drive a lot of what rate designs look like. And there are load objectives - trying to become more efficient. How these factors are integrated into a rate design is discusses.

36333 (EPRI-CU–6332, pp. 3.1-3.20) **Tariffs used for load management in Europe.** de Voghel, L. Electric Power Research Inst., Palo Alto, CA (USA); Pacific Consulting Services, Berkeley, CA (USA). Apr 1989. (CONF-8804269–: International workshop on innovative DSM techniques, Palo Alto, CA, USA, 5-6 Apr 1988). In *International workshop on innovative DSM (demand-side management) techniques. Proceedings.* Order Number DE89011265/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The tariff systems for the countries represented on the Group of Experts as a whole include provisions which, to varying degrees, encourage customers who are able to do so to modify their load curves so as to allow the electricity producer and distributor to balance electricity supply and demand at the lowest cost. The description of the various tariff systems has been discussed in many previous UNIPEDE studies which the Group of Experts was able to use. In particular the reports should be mentioned of the Working Groups chaired by Mr. Massani (Electricity Load Modulation and Tariffs, 1982) and by Mr. Garzenini (Interactions Between Metering Techniques, Load Control, Meter Reading and Billing, 1982), and of the various contributions made to the Tariffs Conference in Helsinki in 1984. Rather than carrying out a detailed new description of the tariff provisions used for load management in each country, a comparative analysis is presented. After stating the principles of these provisions, main forms taken by their implementation in each country, according to the specific context of each are presented. Finally, an attempt is made to bring out the changing trends in these methods of load management using tariffs.

36334 (EPRI-CU–6332, pp. 4.1-4.50) **Comparison of time-of-use rate impacts.** Faruquil, A. Electric Power Research Inst., Palo Alto, CA (USA); Pacific Consulting Services, Berkeley, CA (USA). Apr 1989. (CONF-8804269–: International workshop on innovative DSM techniques, Palo Alto, CA, USA, 5-6 Apr 1988). In *International workshop on innovative DSM (demand-side management) techniques. Proceedings.* Order Number DE89011265/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Some of the insights are presented that have come out of many years of EPRI research on the topic, How do American customers respond to time-of-use (TOU) rates? Much of the information can be categorized as the result of one of three different types of analysis: (1) a historical analysis, that is, analysis of data that has been collected on customers who are on these rate structures in a normal setting; (2) an experimental analysis of situations that were artificially controlled to obtain more precise estimates of customer response; or (3) a simulation analysis of industrial and commercial processes which tries to capture technological possibilities that have not yet been observed but could prevail in the near future. Some results dealing with residential customers are presented. These results were obtained from a series of pricing experiments that were conducted during 1975-1982 across the country by many utilities in conjunction with the Department of Energy (DOE) and the relevant state regulatory bodies. Sixteen experiments were conducted, and out of these EPRI selected the top nine for more detailed analysis. Subsequently, only the top five were analyzed - Southern California Edison, Wisconsin Public Service, Carolina Power and Light, Connecticut Power and Light, and the Los Angeles Department of Water and Power. These analyses are discussed.

36335 (EPRI-CU–6332, pp. 5.1-5.25) **Cost-based pricing in the United States.** Hanser, P. Electric Power Research Inst., Palo Alto, CA (USA); Pacific Consulting Services, Berkeley, CA (USA). Apr 1989. (CONF-8804269–: International workshop on innovative DSM techniques, Palo Alto, CA, USA, 5-6 Apr 1988). In *International workshop on innovative DSM (demand-side management) techniques. Proceedings.* Order Number DE89011265/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Issues having to do with rate design and interruptible/curtailable (I/C) rates are discussed. This is in part based on a research project that EPRI performed which looked at several (close to a hundred) industrial interruptible/curtailable customers throughout the United States, scattered among ten or eleven utilities. Some cost pricing issues that are yet to be resolved are presented. One of them is called dynamic operating benefits; a second one cost allocation; and the third is an introduction to something known as optimal nonuniform pricing. Interruptible and curtailable rates are fairly well known. With an I/C rate the firm agrees to curtail, or lower, its power level - lower its level of demand - to something that has been labeled the firm power level. There are some distinctions that are sometimes made in the United States between interruptible and curtailable rates; also, depending on the utility, they are sometimes reversed. In some utilities, interruptible customers have their entire load interrupted and in others, only a partial load. Curtailable customers tend to have partial interruptions for most utilities. The factors that affect cost-based pricing in the USA are discussed.

36336 (EPRI-CU–6332, pp. 6.1-6.21) **Marginal cost pricing in France.** Fouquetl, D. Electric Power Research Inst., Palo Alto, CA (USA); Pacific Consulting Services, Berkeley, CA (USA). Apr 1989. (CONF-8804269–: International workshop on innovative DSM techniques, Palo Alto, CA, USA, 5-6 Apr 1988). In *International workshop on innovative DSM (demand-side management) techniques. Proceedings.* Order Number DE89011265/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The constant adaptation between electricity supply and demand can be achieved in two ways: on the supply side, through the construction of additional facilities, and on the demand side by implementing tariffs, load management schemes, and a commercial policy. Changes in demand clearly imply changes in the supply system in terms of both the installed capacity and the operating conditions of the system which need to be taken into account. There are two main principles underlying the French electricity pricing policy: equality of treatment and economic efficiency. Equality of treatment means that all customers with the same characteristics of use pay the same price, or, in the case of systems with options, that they have the same tariff options. This principle allows wide tariff differentiation. Indeed, with regard to the importance or the nature of the services they imply, there is a great difference between a kWh supplied at a very high voltage to an industrial customer and a kWh supplied at a low voltage to a domestic customer. For the community, the principle of economic efficiency leads to selling electricity at its marginal cost, which is the cost to the community of a customer who decides to consume an additional unit of a good.

36337 (EPRI-CU–6332, pp. 7.1-7.3) **Discussion on planning and pricing.** Larsson, G. Electric Power Research Inst., Palo Alto, CA (USA); Pacific Consulting Services, Berkeley, CA (USA). Apr 1989. (CONF-8804269–: International workshop on innovative DSM techniques, Palo Alto, CA, USA, 5-6 Apr 1988). In *International workshop on innovative DSM (demand-side management) techniques. Proceedings.* Order Number DE89011265/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Planning is changing at utilities. The facts that are (and should be) taken into account in the planning process are discussed. The role of cost in the development of resource and pricing plans is described. The emergence of least cost planning has been a challenge to the utility planners, but also something that was much needed and which will lead to better over-all plans. The increasing

role of regulation has changed the way utilities approach the planning process; specifically, in the increasing use of planning models that require large amounts of data. Least cost planning has been debated, but not fully understood. No one has a comprehensive, concise definition of least cost planning. This may not be possible at this time because least cost in the long run may not yield anything near least cost in the short run; so the time frame is important. There is no consensus about the appropriateness of using least cost planning in making pricing decision. Making utilities publicly accountable for their long-term planning has been useful for the utilities, albeit painful. It has also been painful on the regulatory side to some extent, since regulators are also now being held accountable for their actions.

36338 (LBL–27130) **Least-cost planning in the utility sector: Progress and challenges.** Goldman, C.; Hirst, E.; Krause, F. (eds.). Lawrence Berkeley Lab., CA (USA); Oak Ridge National Lab., TN (USA). May 1989. 38p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC03-76SF00098;AC05-84OR21400. (ORNL/CON–284). Order Number DE89013768/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This study reviews recent progress in least-cost planning throughout the US and identifies the need for additional work in relevant areas. Although this study was commissioned by DOE to help develop DOE funding priorities, the recommendations presented here go far beyond what DOE's budget can afford. We hope that utilities, their research institutes, and other organizations will use this report in setting their priorities for future work on least-cost planning. Based on the detailed assessments presented in this report, we suggest several foci for long-term LCUP efforts nationwide. Because current rate-of-return regulation rewards utilities for increasing short-term sales, perhaps the most important of these topics is the development of financial incentives for utilities (and their shareholders) to implement least-cost plans. 49 refs., 4 figs., 3 tabs.

36339 (MPUB–99/89) **Manitoba Hydro application for an order requesting a general rate review and approval of certain rate adjustments effective April 1, 1989.** Manitoba Public Utilities Board, Winnipeg, MB (Canada). 1989. 35p. (CE–02662). Available from Manitoba Public Utilities Board, 405 Broadway Ave., Rm. 1146, Winnipeg, MB, Canada R3C 3L6; $5.00 CAN.

This report presents the results of a hearing before the Board to review and approve rate adjustments. The report presents information on the background to the general rate application; the revenue requirements of Manitoba Hydro for its financial objectives, financial forecasts, foreign exchange, pension costs, self insurance, control of expenses, the Manitoba Energy Foundation Act, and the Energy Rate Stabilization Act; and the costs of service relating to load research, generation, and transmission costs, the definition of cost, the inclusion of export customers, and rates. The position of the intervenors is summarized. A number of recommendations relating to the financial operation of Manitoba Hydro are given, as well as an increase in general consumer rates of 5%, and methods of reduction in revenue for various other categories. Revenue rates for residential, small, and medium general service, and streetlighting are given in an appendix.

36340 (PNL-SA–17006) **Experiences with a large load research project in the Pacific Northwest: ELCAP [End-Use Load and Consumer Assessment Program].** Gillman, R.A.; Sandusky, W.F.; Patton, J.E.; Hauser, S.G. Pacific Northwest Lab., Richland, WA (USA). May 1989. 19p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC06-76RL01830. (CONF-8905123–2: End use load information and application conference, Syracuse, NY, USA, 16-17 May 1989). Order Number DE89014457/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Bonneville Power Administration (Bonneville) began the End-Use Load and Consumer Assessment Program (ELCAP) in August, 1983, to support demand side planning, forecasting, and demand side program development and delivery. This project, conducted for Bonneville by the Pacific Northwest Laboratory (PNL), which is operated for the Department of Energy by the Battelle Memorial Institute, involves the collection and analysis of hourly end-use electricity usage data together with detailed characteristics from approximately 400 residences and 100 commercial buildings in the Pacific Northwest. The purpose of this paper is to relate our experiences with the ELCAP from its early days to its current status. This paper will explore Bonneville's and PNL's experiences ranging from project formulation to technology development to current management issues. We will specifically cover knowledge gained from the development of data loggers, loggers installation, measurement protocols, and data quality assurance. Additionally, the more global issues associated with managing the ELCAP and maintaining agency support in a time of cost-consciousness will be discussed. These issues include the areas of budgets, perceptions, producing useful results, and data availability. 3 refs.

36341 (DOE/EIA–M033(87)) **Documentation for the State Energy Data System 1960–1987 diskettes.** USDOE Energy Information Administration, Washington, DC (USA). May 1989. 12p. Sponsored by DOE Management & Administration. Order Number DE89014433/JAW. Available from NTIS, PC A03/MF A01 - GPO - OSTI; GPO Dep.

The State Energy Data System (SEDS) Diskettes contain data from the publication "State Energy Data Report, Consumption Estimates, 1960–1987." The state data are grouped by Census Region with one region per diskette. In addition to the states in the Census Region, each diskette contains data for the United States. Also included on the diskettes are two utility programs which will format the data for use by the most widely used spreadsheet and data base software products.

36342 (EPRI-CU–6332, pp. 11.1-11.14) **Research in photovoltaics.** Schaefer, J. Electric Power Research Inst., Palo Alto, CA (USA); Pacific Consulting Services, Berkeley, CA (USA). Apr 1989. (CONF-8804269–: International workshop on innovative DSM techniques, Palo Alto, CA, USA, 5-6 Apr 1988). In *International workshop on innovative DSM (demand-side management) techniques. Proceedings.* Order Number DE89011265/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The issues involved in applying photovoltaic (PV) to the electricity supply problem are discussed. There is some interest in the electric utility industry in the United States in photovoltaics not only as a supply option, but also as a demand reduction option. The economic issues in PV, future prospects far decreased costs, and field test results of line-connected US PV systems are discussed. It is concluded that the technical feasibility of these systems has been demonstrated, the widespread uses now for PV applications are in remote areas, costs are still too high for bulk power supply, and all technologies are potentially cost-effective.

36343 (EPRI-CU–6332, pp. 11.15-11.24) **Status of photovoltaics for commercial power generation.** Schaefer, J.C. Electric Power Research Inst., Palo Alto, CA (USA); Pacific Consulting Services, Berkeley, CA (USA). Apr 1989. (CONF-8804269–: International workshop on innovative DSM techniques, Palo Alto, CA, USA, 5-6 Apr 1988). In *International workshop on innovative DSM (demand-side management) techniques. Proceedings.* Order Number DE89011265/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Photovoltaic power generation is perhaps the simplest mechanism known for generating electricity. The process generates direct current from sunlight, using cells that consist of a chemically treated semiconductor material - usually silicon. Each cell typically provides less than a volt and less than one ampere so they are wired in series to get more voltage and in parallel to get more current. Manufacturers produce modules ranging in size up to 20 square feet. Sunlight is a very diffuse source of energy - only about a kilowatt per square meter is available on a bright, sunny day - so large collector areas are required to generate commercially useful quantities of electricity. This fact has important implications for photovoltaics'

applications, and because it would not be cost effective to repair large area systems it also places severe requirements on the reliability of the cells and interconnections in a photovoltaic (PV) system. Experience over the past 10 years demonstrates that these systems have become extremely reliable, which is one reason for the great interest shown not only by individuals but also by institutions such as electric utilities. The commercial uses of these systems, cost, field test results, and outlook for PV supply are discussed.

36344 (NEI-DK–172) **Decentral dual-purpose power plants.** Teknologiraadets Styregruppe for Vedvarende Energi, Copenhagen (Denmark). Nov 1987. 90p. (In Danish). (CONF-8710469–: Conference on decentral dual-purpose power plants, Moltkes Palae, Denmark, 26 Oct 1987). Order Number DE89776141/JAW. Available from NTIS (US Sales Only), PC A05/MF A01.

The purpose of the conference was to elucidate, and produce suggestions for methods of solving, problems concerning the use of renewable energy sources in relation to decentral dual-purpose power plants in Denmark. (AB).

30 DIRECT ENERGY CONVERSION

3001 MHD Generators

36345 (DOE/ET/15601–30) **Diagnostic development and support of MHD test facilities: Progress report, July–September 1987.** Shepard, W.S.; Cook, R.L. Mississippi State Univ., Mississippi State, MS (USA). MHD Energy Center. Oct 1987. 58p. Sponsored by DOE Fossil Energy. DOE Contract AC02-80ET15601. Order Number DE89013110/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

Mississippi State University is developing diagnostic instruments for MHD power train acquisition and for support of MHD component development test facilities. Microprocessor-controlled optical instruments, initially developed for HRSR support, are being refined, and new systems to measure temperatures and gas-seed-slag stream characteristics are being developed. To further data acquisition and analysis capabilities, the diagnostic systems are being interfaced with MHD Energy Center computers. Additionally, technical support of the diagnostic needs of the national MHD research effort is being provided. 10 refs., 23 figs.

36346 (DOE/PC/90274–T1) **MHD Integrated Topping Cycle Project: Quarterly progress report, 30 September–31 October 1987.** TRW Space and Technology Group, Redondo Beach, CA (USA). Jan 1989. 26p. Sponsored by DOE Fossil Energy. DOE Contract AC22-87PC90274. (MHD-ITC–89-001). Order Number DE89014126/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The overall objective of the project is to design and construct prototypical hardware from an integrated MHD topping cycle, and conduct long duration proof-of-concept tests of the integrated system at the US DOE Component Development and Integration Facility in Butte, Montana. The results of the long duration tests will augment the existing engineering design data base on MHD power train reliability, availability, maintainability and performance, and will serve as a basis for scaling up the topping cycle design to the next level of development, an early commercial scale power plant retrofit. Progress is reported on the design, fabrication, and testing of components of the MHD power train. 1 fig.

36347 (DOE/PC/90274–T2) **MHD Integrated Topping Cycle Project: Third quarterly progress report, 1 February–30 April 1988.** TRW Defense and Space Systems Group, Redondo Beach, CA (USA). Applied Technology Div. Jan 1989. 25p. Sponsored by DOE Fossil Energy. DOE Contract AC22-87PC90274. (MHD-ITC–89-003). Order Number DE89014130/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The overall objective of the project is to design and construct prototypical hardware for an integrated MHD topping cycle, and conduct long duration proof-of-concept tests of the integrated system at the US DOE Component Development and Integration Facility in Butte, Montana. The results of the long duration tests will augment the existing engineering design data base on MHD power train reliability, availability, maintainability, and performance, and will serve as a basis for scaling up the topping cycle design to the next level of development, an early commercial scale power plant retrofit. This quarter, work continued on planning, and design, fabrication and testing of the components of the MHD power train.

36348 (DOE/PC/90274–T3) **MHD [Magnetohydrodynamics] Integrated Topping Cycle Project: Second quarterly technical progress report, November 1, 1987–January 31, 1988.** TRW Space and Technology Group, Redondo Beach, CA (USA). Applied Technology Div. Jan 1989. 27p. Sponsored by DOE Fossil Energy. DOE Contract AC22-87PC90274. (MHD-ITC–89-002). Order Number DE89014129/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The overall objective of the project is to design and construct prototypical hardware for an integrated MHD topping cycle, and conduct long duration proof-of-concept tests of the integrated system at the US DOE Component Development and Integration Facility in Butte, Montana. The results of the long duration tests will augment the existing engineering design data base on MHD power train reliability, availability, maintainability, and performance, and will serve as a basis for scaling up the topping cycle design to the next level of development, an early commercial scale power plant retrofit. Progress results towards the design, fabrication and testing of the components of the MHD power train are reported. 1 fig.

36349 MHD bottoming cycle component testing at the coal fired flow facility - 1987. Attig, R.C. (The Univ. of Tennessee Space Institute, Tullahoma, TN (US)); Muehlhauser, J.W.; Johanson, N.R.; Sanders, M.E. v.v of 26th symposium on engineering aspects of magnetohydrodynamics. Muehlhauser, J.W. University of Tennessee Space Institute, Tullahoma, TN (1988). (CONF-880647–: 26. symposium on engineering aspects of magnetohydrodynamics, Nashville, TN, USA, 20-22 Jun 1988).

During the period covered by this status report, four tests were conducted at the DOE Coal Fired Flow Facility. Much of this time is proof-of-concept testing aimed primarily at evaluating superheater and intermediate temperature air heater tube materials behavior and fouling of tube bank surfaces. The performance of other components, especially the baghouse and electrostatic precipitator, is also being evaluated. The report also describes component and facility modifications and improvements made during this period. One significant observation made during the period was the effect of seed to coal sulfur ratio on fouling and performance of the particulate collection equipment. Fouling was noted to be significantly less when there was a slight deficiency of potassium to react with all to the sulfur. Performance of the particulate collection equipment was also better. The performance of the ESP was also determined at two gas flow rates. Gas temperatures at the superheater test sections were sufficiently high to melt potassium sulfate.

36350 Coal-fired MHD topping cycle test progress at the component development and integration facility. Funk, G. (MSE, Inc., Butte, MT (US)); Hart, A.; Stepan, I. v.v of 26th symposium on engineering aspects of magnetohydrodynamics. Muehlhauser, J.W. University of Tennessee Space Institute, Tullahoma, TN (1988). (CONF-880647–: 26. symposium on engineering aspects of magnetohydrodynamics, Nashville, TN, USA, 20-22 Jun 1988).

Recent testing emphasized characterizing iron oxide injection into the CFC and obtaining baseline data for eastern coal (Illinois #6). Sufficient data was collected on the iron oxide test series to confirm the beneficial affects of iron oxide with western coal on cathode wall shorting. In addition, data showed iron oxide injection, in general, does not produce significant improvement in power output. Eastern coal, in conjunction with the iron oxide, produced a significant increase in conductivity and some increased power level. The open circuit voltage remained at the same level as recent western coal tests, while significant increases in closed circuit current were observed. Iron oxide injection with eastern coal did not produce the significant beneficial affects on the cathode wall shorting that it did with western coal.

36351 Experimental investigation of factors affecting the cathode wall slag layer resegmentation frequency. Pian, C.C.P.

(Avco Research Lab., Inc., Everett, MA (US)); Petty, S.W.; McClaine, A.W. v.v of 26th symposium on engineering aspects of magnetohydrodynamics. Muehlhauser, J.W. University of Tennessee Space Institute, Tullahoma, TN (1988). (CONF-880647–: 26. symposium on engineering aspects of magnetohydrodynamics, Nashville, TN, USA, 20-22 Jun 1988).

A series of generator experiments was carried out to investigate the functional dependencies of the cathode wall slag layer resegmentation frequency upon gasdynamic and generator characteristics. Variations in gas conductivity, magnetic field intensity, Hall parameter, current density, and electric field intensity were investigated to establish which generator parameter(s) affects the cathode slag shorting patterns. The validity of three proposed models for 3 lag layer resegmentations are tested by comparisons with measured data. The generator test results, showing that the cathode nonuniformity patterns are only a function of the Hall voltage, suggest that the high voltage inter-cathode gaps might be created by axial leakage currents and maintained by arcs. The voltage across the open gap is characteristic of an arc voltage.

36352 On the nature of slag chemistry in an MHD generator. Rosa, R.J. (Montana State Univ., Bozeman, MT (US)); Pollina, R.J.; Farrar, L.C. v.v of 26th symposium on engineering aspects of magnetohydrodynamics. Muehlhauser, J.W. University of Tennessee Space Institute, Tullahoma, TN (1988). (CONF-880647–: 26. symposium on engineering aspects of magnetohydrodynamics, Nashville, TN, USA, 20-22 Jun 1988).

A progress report is provided on an exploratory study, supplemented by limited experimental data, to establish the influence of slag composition on the MHD generator performance. From the results obtained to date it can be concluded that detailed analysis of the slag composition can be useful in evaluating coal-fired MHD generator performance. Electrical losses of the generator have been coupled to axial current leakage, which to a large extent is due to the electrical nature of the slag. The slag electrical behavior is dominated by the relative values of ionic to electronic current transport - especially on the cathode wall. The influence that metallic phases of iron and potassium, in conjunction with a percolation type of current transport are introduced as a way to interpret slag current leakage mechanisms.

36353 Strategies for combatting problems caused by cathode slag shorting. McClaine, A.W. (Avco Research Lab., Inc., 2385 Revere Beach Parkway, Everett, MA (US)); Pian, C.C.P.; Petty, S.W.; Pakko, J.D.; Schmitt, E.W. v.v of 26th symposium on engineering aspects of magnetohydrodynamics. Muehlhauser, J.W. University of Tennessee Space Institute, Tullahoma, TN (1988). (CONF-880647–: 26. symposium on engineering aspects of magnetohydrodynamics, Nashville, TN, USA, 20-22 Jun 1988).

During the long duration testing in the Avco Mk VII generator (which has demonstrated over 1300 hours of duration on the Avco anode designs), excessive corrosion on the cathode edges of the insulator walls was observed. This corrosion has been correlated with the high voltages on inter-cathode insulators resulting from the inter-electrode shorting of neighboring cathodes. This paper presents a description of the problem and describes the results of three strategies for controlling this problem. The first strategy is an on-going experimental investigation in which materials and designs for insulator wall elements are being explored. The second strategy uses slag chemistry modifications to reduce inter-cathode shorting and the resulting inter-cathode voltages. The third strategy is aimed at understanding the nature of the cathode wall shorting phenomena and using this understanding to develop other methods for controlling the magnitude of the inter-cathode voltages.

36354 Voltage-current characteristics of the insulator gaps in a slagging MHD generator. Pian, C.C.P. (Avco Research Lab., Inc., 2385 Revere Beach Parkway, Everett, MA (US)); Sadounik, I.; Petty, S.W.; McClaine, A.W.; Pakko, J.D. v.v of 26th symposium on engineering aspects of magnetohydrodynamics. Muehlhauser, J.W. University of Tennessee Space Institute, Tullahoma, TN (1988). (CONF-880647–: 26. symposium on engineering aspects of magnetohydrodynamics, Nashville, TN, USA, 20-22 Jun 1988).

The voltage-current characteristics of inter-element insulators have been measured during slagging generator tests in the Avco Mk VII facility. These measurements were made to determine the leakage resistances of the slag covered inter-electrode and inter-peg insulators, and to identify possible mechanisms for the resegmentation of the cathode wall slag layer. The V-I measurements were made for anode, cathode, and sidewall insulator gaps, and for cold and semi-hot electrode designs. The effects of magnetic field and slag doping were also investigated. An interpretative analytical model, based on an equivalent network formulation, was developed to reduce the test data and to determine the amounts of leakage current across the insulators.

36355 Coal-fired MHD power train performance test results. Solbes, A. (Applied Technology Div., TRW Space and Technology Group, Redondo Beach, CA (US)); Ogle, G.J.; Myrick, S.; Petty, S.W.; Pian, C.C.P.; Farrar, L.C. v.v of 26th symposium on engineering aspects of magnetohydrodynamics. Muehlhauser, J.W. University of Tennessee Space Institute, Tullahoma, TN (1988). (CONF-880647–: 26. symposium on engineering aspects of magnetohydrodynamics, Nashville, TN, USA, 20-22 Jun 1988).

Coal-fired MHD power train test activities at the Department of Energy's Component Development and Integration Facility (CDIF) have been conducted primarily for evaluation and improvement of generator performance. Test analyses have indicated that the following areas can impact the measured performance of the power train: 1) plasma conductivity, 2) plasma non-uniformity, 3) boundary layer voltage drop, and 4) current leakage in the slag layer. The test program in progress has been designed to investigate the effect of each of these mechanisms on channel power. Test hardware configuration changes and variations in operating conditions have been undertaken to characterize the power train performance.

36356 Status report of 1A test train hardware performance and development. Giovan, R.J. (Component Development and Integration Facility, MSE, Inc., Butte, MT (US)); Lee, Y.M. v.v of 26th symposium on engineering aspects of magnetohydrodynamics. Muehlhauser, J.W. University of Tennessee Space Institute, Tullahoma, TN (1988). (CONF-880647–: 26. symposium on engineering aspects of magnetohydrodynamics, Nashville, TN, USA, 20-22 Jun 1988).

A status report is presented on the performance and development of the 1A test train hardware at the Department of Energy's Component Development and Integration Facility (CDIF) from March 25, 1987, through March 25, 1988. Included in the report are the thermal and electrical performance of the coal-fired combustor (CFC), the two 1A channels, and the various special wall sections that make up the channels. The special wall sections include a refurbished platinum-capped anode wall, forward peg-style sidewalls, newly designed and fabricated cathode walls, and diagonal sidewalls refurbished with newly designed and fabricated cathode sidebars. The report also includes a status of the recently installed stainless steel capped, segmented, electrically isolated, second-stage nozzle for the CFC, and a discussion of the analytical techniques used during the analysis phase of the nozzle design.

36357 Materials tests in support of MHD steam bottoming plant. Natesan, K. (Argonne National Lab., Argonne, IL (US)); Swift, W.M. v.v of 26th symposium on engineering aspects of magnetohydrodynamics. Muehlhauser, J.W. University of Tennessee Space Institute, Tullahoma, TN (1988). (CONF-880647–: 26. symposium on engineering aspects of magnetohydrodynamics, Nashville, TN, USA, 20-22 Jun 1988).

Test data have been developed for the corrosion of several commercial ASME-coded alloys and their weldments by exposing internally cooled ring specimens to simulated MHD environments. The specimens, coated with a K_2SO_4-rich deposit, were exposed for times up to 2000 h at metal temperatures of 762 and 593^{0}C to simulate, intermediate-temperature air heater (ITAH) and transition region conditions, respectively. The gas temperatures in these tests were 982 and 816^{0}C, respectively. This paper discusses, in detail, the observed corrosion scale morphologies of various exposed specimens. Data on scale thickness, depth of intergranular penetration, and metal recession are presented and the results are used to assess the corrosion behavior of various materials for application in the MHD steam bottoming plant.

36358 Two dimensional modeling of fluid mechanics, heat transfer, and NO decomposition in the CFFF radiant furnace.

Crawford, L.W. (The Univ. of Tennessee Space Institute, Tullahoma, TN (US)); Lee, J.J.; Lineberry, J.T. v.v of 26th symposium on engineering aspects of magnetohydrodynamics. Muehlhauser, J.W. University of Tennessee Space Institute, Tullahoma, TN (1988). (CONF-880647–: 26. symposium on engineering aspects of magnetohydrodynamics, Nashville, TN, USA, 20-22 Jun 1988).

The results of computations of two dimensional, steady flow with heat transfer and chemical reactions in the CFFF radiant furnace is presented. Two dimensional gas dynamic modeling was used to analyze the recirculating flowfield of the furnace. This model has been used in past furnace studies and includes the effects of turbulence, compressibility, and radiative heat transfer. A kinetics model (the PROF code) which has been tailored for study of NO decomposition in the CFFF downstream test train was applied to results of the precomputed flowfield to obtain predictions of NO decomposition within the furnace. Application of the kinetics model was made along flowfield streamlines. The two-dimensional furnace heat transfer and gas dynamic calculations were used to specify velocity, pressure, and temperature distributions.

36359 **MHD plasma velocity measurement using correlation techniques.** Schiller, D. (Component Development and Integration Facility, Butte, MT (US)); Joyce, J.; Lofftus, D. v.v of 26th symposium on engineering aspects of magnetohydrodynamics. Muehlhauser, J.W. University of Tennessee Space Institute, Tullahoma, TN (1988). (CONF-880647–: 26. symposium on engineering aspects of magnetohydrodynamics, Nashville, TN, USA, 20-22 Jun 1988).

This paper reports the progress on development of a technique for measuring plasma velocity used in analyzing channel performance at the Component Development and Integration Facility (CDIF). Fluctuations of plasma properties (principally conductivity) influence external diagonal currents as the plasma passes electrodes along the MHD channel. Signals from current sensors on the diagonal links of the channel are recorded on analog tape and later digitized. Commercial microcomputer-based signal analysis software is used to estimate the time shift between current fluctuations on distant electrodes using cross correlation algorithms. The time shift is used with measured electrode separation to estimate average plasma velocity. Results presented here include time and power spectral density plots for link current data, cross correlation plots, and a tabular list of measured velocity values.

36360 **Cold flow modeling study of coal-fired MHD combustor.** Grove, A. (Applied Technology Div., TRW Space and Technology Group, Redondo Beach, CA (US)); Ubhayakar, S.K. v.v of 26th symposium on engineering aspects of magnetohydrodynamics. Muehlhauser, J.W. University of Tennessee Space Institute, Tullahoma, TN (1988). (CONF-880647–: 26. symposium on engineering aspects of magnetohydrodynamics, Nashville, TN, USA, 20-22 Jun 1988).

The characterization and visualization of the flow and mixing patterns in slagging MHD combustors is a valuable tool to help improve the design of existing combustor systems. Cold flow modeling is a convenient and expeditious way of characterizing the major flow patterns within a combustor and investigating design improvements. A 1/3 scale, transparent cold flow model of TRW's 50 MW_t MHD combustor has been developed for flow visualization studies. The modeling guidelines adopted for the design and operation of the cold flow model are presented as well as a description and photographs of the model hardware. Observations from initial cold flow studies are also included.

3005 Fuel Cells

36361 (DOE/IR/05106–T78) **On-site municipal fuel cell power plant: Feasibility and applications guide.** Urban Consortium for Technology Initiatives (USA). Energy Task Force. Dec 1986. 78p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract FG02-78IR05106. Order Number DE89013842/JAW. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

Fuel cells represent a power source of the future. Though they have been experimented with for decades, their potential is just beginning to be utilized in applications that vary in size from multimegawatt power stations to one kilowatt units used in aerospace applications. Public utility and industrial power is currently being provided in a few cases by carefully monitored fuel cells. The Gas Research Institute and United Technologies Corporation, have also been conducting tests on flexible, modular 40 kilowatt on-site fuel cells. United Technologies Corporation is currently developing a 200 kilowatt unit. These latter on-site power generators may have applications in municipal operations. The city of Albuquerque has examined the performance record of the 40 kilowatt units and the projected performance of the 200 kilowatt units. Energy demands for several "typical" municipal facilities have also been studied. By comparing the cost of energy production from the fuel cells and the cost of conventional energy used by existing facilities, this report examines both the current and future feasibility of using fuel cells at several facilities. During the course of this project, an applications guide was developed by the Gas Research Institute and applied to the facilities examined in this study. 8 figs., 9 tabs.

36362 (LBL–27082) **Fuel cell technology in the United States.** Kinoshita, K. Lawrence Berkeley Lab., CA (USA). Apr 1989. 31p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC03-76SF00098. (CONF-8905164–1: Seminar at Paul Scherrer Institute, Wurenlingen, Switzerland, 29 May - 7 jun 1989). Order Number DE89013430/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Fuel cells provide a new and exciting option for the efficient conversion of fossil fuels to electricity. Development of fuel- cell technology has been underway in the United States (US) for over 20 years, with the initial focus on space application (i.e., Gemini, Apollo). More recently, commercialization of fuel cells for utility power generation and transportation applications has received considerable attention in the US. The purpose of this paper is to summarize the status of fuel-cell technology in the US, where development of five major fuel cell systems are underway. 26 refs., 5 figs., 4 tabs.

36363 (PB–89-142616/XAB) **Improved acid electrolytes: synthesis and structure of fluorine-containing sulfonic acids for fuel cells. Final report, July 1987-August 1988.** Gard, G.L. Portland State Univ., OR (USA). Dept. of Chemistry. Sep 1988. 20p. Available from NTIS, PC A03/MF A01.

See also PB–87-235693.

Seven new ether-containing sulfonyl fluorides (precursors to sulfonic acids) were prepared from $I(CF_2)_2O(CF_2)_2SO_2F$ and unsaturated olefins/alkynes. Two new ether sultones were prepared. A more efficient route for preparing ether containing sulfonic acids has been discovered. Additional quantities of mono/di sulfonic acids have been prepared and evaluated by Dr. Ross. Significant results for fuel cell electrolytes have been achieved.

36364 (PB–89-173629/XAB) **Improved acid electrolytes for fuel cells. Final report, July 1985-January 1989.** Shreeve, J.M. Idaho Univ., Moscow, ID (USA). Dept. of Chemistry. Jan 1989. 38p. Available from NTIS, PC A03/MF A01.

See also PB–87-235685.

A large number of new acids and their precursors were synthesized and characterized, including four monophosphonics ((CF3)2CFP(O)(OH)2, H(CF2)2O(CF2)2P(O)(OH)2, H(CF2)4O(CF2)2P(OH)2, and (HO)2P(O)(CF2)4O(CF2)2H); two monosulfonics (CF3CF2O(CF2)2SO2OH:H2O and CF3(CF2)3O(CF2)2SO2OH:H2O); one disulfonic, HOSO2CF2CF2OCF2SO2OH; and three mixed phosphonic/sulfonics ((HO)2P(O)CF2SO2OH, (HO)2P(O)CFHSO2OH, and (HO)2P(O)(CF2)4O(CF2)2SO2OH). Two perfluoroalkyl phosphonic acids, the disulfonic acid and (HO)2P(O)CF2SO3H were synthesized in larger quantities for further testing as electrolytes or additives in fuel cells. The acids with ether linkages appear to exhibit good water solubility and superior activity for oxygen reduction compared to phosphoric acid when used as additives.

See also PB–88-133491.

Effort under the project is focused on successfully operating a tubular solid oxide fuel cell (SOFC) generator directly on pipeline natural gas without external reforming. A materials test loop and a highly instrumented test facility have been placed in operation. A 2000-hour single cell life test was successfully completed. Impregnation of both anode and module parts was demonstrated to minimize carbon deposition. Stable performance was demonstrated in two 36-cell bundle tests. A 3-kW module has been developed which can serve as the building block of larger modules. Studies were performed on potential SOFC generator users' requirements and applications to confirm competitive potential in industrial and cogeneration applications.

36366 The nature and composition of the passive film formed on Ni-P-Cr metallic glasses. Helfand, M.A. (Dept. of Materials Science and Engineering, State Univ. of New York at Stony Brook, Stony Brook, NY (US)); Clayton, C.R.; Sorensen, N.R.; Diegle, R.B. v.v of Proceedings of the Electrochemical Society fall meeting. Volume 88-2 (extended abstracts). The Electrochemical Society, Pennington, NJ (1988). (CONF-881061–: Electrochemical Society fall meeting, Chicago, Illinois, USA, 9-14 Oct 1988).

The presence of both Cr and P in transistion-metal metalloid glasses has been observed to promote the development of very stable, protective passive films. In order to investigate the interaction of Cr and P in the formation of passive films four alloy systems where chosen for study; Ni-20P, Ni-20P-3Cr, Ni-20P-6Cr and Ni-20P-10Cr. All the alloys were prepared by melt spinning and the glassy structure was confirmed by X-ray and electron diffraction, and by transmission electron microscopy. The authors have examined the anodic behavior and the composition of the passive film formed on these alloys in 0.2N HCl (pH=0.7) and 0.2N H_2SO_4 (pH=1.2) using electrochemical techniques and surface analysis (XPS and AES). A very interesting property of the glassy alloys containing P or P and Cr together is their insensitivity to Cl ion attack. The authors have speculated that this may be due to a cation selective effect which is induced by phosphate anions in the outermost portion of the passive film. Increasing Cr additions enhances this effect. The alloys exhibit wider passive potential regions and lower passive current densities as the Cr content is increased. A second interesting property of the Ni-P-Cr alloys is the composition and chemical make-up of the passive film. XPS results obtained from the surfaces of the polish-formed films and passive films on the glassy alloys show the polish-formed films to contain Cr_2O_3, which is considered by many to be the main passivating species of stainless steels.

36367 Impedance spectroscopy for the study of anodic copper dissolution in sulfuric acid in presence of benzotriazole. Clerc, C. (Dept. of Chemical Engineering, and Materials Research Lab., Univ. of Illinois, Urbana, IL (US)); Alkire, R.C. v.v of Proceedings of the Electrochemical Society fall meeting. Volume 88-2 (extended abstracts). The Electrochemical Society, Pennington, NJ (1988). (CONF-881061–: Electrochemical Society fall meeting, Chicago, Illinois, USA, 9-14 Oct 1988).

The presence of an anodic surface film dramatically affects the electrochemical behavior of dissolving electrode in processes like corrosion inhibition, passivity, electropolishing or pitting. The present study was initiated to learn more about the physical properties of the surface films present at the surface of a copper electrode during anodic dissolution in 0.5 SM sulfuric acid and 40 mM benzotriazole (BTA) at 25°C. This study is of practical importance because this organic compound is widely used for corrosion inhibition and as etching additive. The impedance spectra measured after 10 min of polarization (with a SOLARTRAN 1250 Frequency Response Analyzer and a SOLARTRON 1286 Electrochemical Interface) were analyzed by comparison with a physical model of the electrochemical interface in which the passive electrode is covered with a barrier layer. The main assumptions are that this barrier layer is a good electronic insulator of stoichiometric composition and that charge transfer reactions and double layer charging occur at both metal-barrier layer and barrier layer-electrolyte interphases. This model also considers the change in the barrier layer thickness under the influence of the applied potential. Least squares fitting of measured impedance spectra yield physical parameters of reasonable order of magnitude to support the proposed model. As predicted it was found that the barrier layer is itself covered by an outer porous film of corrosion products and that the metallic ions transfer through the barrier layer under high field conduction. By comparing the crystallographic lattice parameters and the dielectric constants of different copper compounds, the jump distance was determined to be about 5.5 A, indicating that the barrier layer is likely to be an hydrated copper sulfate ($CuSO_4$ $5H_2O$).

36368 The influence of surface capacitance on the measurements of localized corrosion transients. Isaacs, H.S. (Dept. of Applied Science, Brookhaven National Lab., Upton, NY (US)); Davenport, A.J. v.v of Proceedings of the Electrochemical Society fall meeting. Volume 88-2 (extended abstracts). The Electrochemical Society, Pennington, NJ (1988). (CONF-881061–: Electrochemical Society fall meeting, Chicago, Illinois, USA, 9-14 Oct 1988).

The difficulty of measuring the early stages of localized corrosion transients during pit growth, the repeated step growth in stress corrosion cracking or scratching, arises from the charging of the capacitance of the passive surface surrounding the actively corroding area. The charging of the surface delays the transmission of the potential during open circuit measurements or the current response of the potentiostat when under potential control. The effect of surface capacitance on the flow of current has been presented previously. At high frequencies (or short times) the low effective interfacial impedance makes electrodes behave as equipotential surfaces with very high current densities at the edges. The capacitance of the surface was also found to dominate potential transients when pits grew for a few seconds. The measurement of the kinetics of the early stages of pitting corrosion is an important aspect of the understanding of the process controlling the development of pits. Two approaches have been used to separate the contributions of the surface impedance to the observed transients. The first was the measurement of signal transmission along metal surfaces. The second was a computer simulation of the processes. The measurement of signal transmission was made with wire electrodes under potentiostatic control. An alloy 600 wire was supported in a tubular cell with the tip of one reference electrode positioned at various distances along the wire. A second reference electrode and an exposed wire tip auxillary electrode was placed at a fixed position close together near one end of the wire. These electrodes were used to produce a local single rectangular potential transient on the wire and the second reference electrode was used to monitor the propagating pulse along the wire.

36369 Measurements of the structure and dynamics of thin film growth on electrode surfaces by SHG. Richmond, G.L. (Chemical Physics Institute, Univ. of Oregon, Eugene, OR (US)); Shannon, V.L.; Koos, D.A. v.v of Proceedings of the Electrochemical Society fall meeting. Volume 88-2 (extended abstracts). The Electrochemical Society, Pennington, NJ (1988). (CONF-881061–: Electrochemical Society fall meeting, Chicago, Illinois, USA, 9-14 Oct 1988).

Over the past five years, research in this laboratory has focussed on the use of optical second harmonic generation (SHG) in probing interactions at the solid/liquid interface. The studies have provided valuable information about the sensitivity of SHG to such phenomena as molecular and ionic adsorption at smooth electrode surfaces, oxidative film formation, underpotential deposition processes, oxide formation and the dynamics of adsorption. More recently, our studies have focussed on the use of SHG to probe electrode surface structure and symmetry by the anisotropy in the SH response as the crystalline electrode is rotated about its surface normal. This talk summarizes recent results in this area for which the structure and dynamics of underpotentially deposited monolayers on crystalline metal surfaces are monitored in situ. Deposition of a monolayer or submonolayer of these foreign metals is intrinsically controlled by the change in the work function of the surface as the overlayer grows in a stepwise manner. Because of its proven sensitivity to surface structure, reconstruction and thin film growth, SHG is an attractive technique to investigate the processes occurring during lattice formation at the metal/metal interface in solution. The studies described here are Ag(111)/Pb, Ag(111)/Tl, Ag(110)/Tl, and Cu(111)/Tl. The results for the Ag(111)/Tl system are described to provide an example of the type of information which is obtainable.

36371 (BCH–8809) **Village energy retrofit of electric domestic water heating in a B.C. Hydro diesel generating area.** British Columbia Hydro, Vancouver, BC (Canada). 1988. 32p. (MICROLOG–89-01977). Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

In 1987, B.C. Hydro, with financial assistance from Energy, Mines and Resources (EMR) Canada, supplied and installed over 2000 insulating blankets on electric water heaters, in B.C. Hydro's diesel generation areas. Shower restrictors and tank thermostat turndowns were also offered. Monitoring of the electrical consumption of the serviced homes indicated an average reduction of 950 kWh/y due to the blanket. One new home was upgraged to energy efficient standards. An electrically heated office building was retrofitted with air source heat pumps, and a number of simple energy saving devices and modifications to reduce electricity consumption were incorporated into the building. There was consequently a 25% reduction in both energy consumption and peak demand. Without EMR's contribution, the payback period of the program is three years. As a result, B.C. Hydro extended the domestic water heater energy conservation program to its hydro-electric grid area. In conclusion, it appears that the success of a utility-directed community-level conservation program depends on a commitment by managment at the community level, on aggressive promotion (at the personal level if necessary), and on well-informed contractors. 10 refs., 3 figs., 6 tabs.

36372 (BCH/RC–438-U-SOA) **Residential domestic water heating advisory computer program. Vol. 2, computer user's guide. Vol. 3, programmer's guide.** McClelland, L.A. British Columbia Hydro, Vancouver, BC (Canada). Residential and Commercial Energy Management. 1987. 55p. (CE–02635). Available from Canadian Electrical Association, Research & Development, Suite #500, One Westmount Square, Montreal, PQ, Canada H3Z 2P9; $75.00 NON-MEMBERS; MEMBERS: PRICES UPON REQUEST, FUNDS CAN.

The WATERHTG computer program was developed to aid in the marketing and customer advisory efforts of the Canadian Electrical Association member utilities. It produces an analysis of residential water heating costs with varying fuels and temperatures as well as presenting economic comparisons between purchased heaters and rental units where utility lease programs are available. The program is divided into three levels. This document gives information on analysis levels, distribution diskette files, hardware requirements, customer and utility screen options, and programming modifications for both computer users and programmers.

36373 (BCH/RC–438-U-SOA) **Residential domestic water heating advisory computer program. Vol. 1, technical report.** McClelland, L.A. British Columbia Hydro, Vancouver, BC (Canada). Residential and Commercial Energy Management. 1987. 31p. (CE–02634). Available from Canadian Electrical Association, Research & Development, Suite #500, One Westmount Square, Montreal, PQ, Canada H3Z 2P9; $75.00 NON-MEMBERS; MEMBERS: PRICES UPON REQUEST, FUNDS CAN.

A project was initiated to develop a computer package to assist in the marketing and customer advisory efforts of the Canadian Electrical Association member utilities. The program called WATERHTG produces an analysis of residential water heating costs with various fuels and temperatures as well as presenting economic comparisons between purchased heaters and rental units where utility lease programs are available. The program provides for the analysis of domestic water heating systems on three levels, with multiple levels of detail provided to handle different enquiry situations. A level 1 analysis, representing average household systems, is used for marketing estimates and general customer enquiries; level 2, providing detailed modelling of the storage tank heater, is most useful for enquiries regarding heater comparisons and selection; and level 3, the most detailed, models water use patterns and is therefore able to analyze the effect of appliance changes and varying hot water use. The work performed began with a literature search of existing water heater reports on modelling methods and monitoring results. Previous modelling was expanded upon with the aid of the located literature to obtain improved performance estimates for storage tank water heaters. In addition, 80 homeowners were surveyed to determine detailed water use patterns according to appliance usage and the surveys were used to develop a hot water usage algorithm based on family size and other factors. 9 refs., 6 figs., 3 tabs.

36374 (BFR-R–81-1988) **Conversion of detached houses with direct electric heating to district heating.** Kellner, J.; Nilsson, R.; Wikander, G.R. Swedish Council for Building Research, Stockholm (Sweden). 1988. 35p. (In Swedish). Order Number DE89776238/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

Initial outline design has been carried out to investigate the factors involved in converting estates of houses having direct electric heating to low-temperature district heating. An area of two-story terrace houses in Upplands Vaerby, and another of single-story linked houses in Nacka, both in Stockholm county, have been chosen as application examples. Airborne heating has been selected as the main method for internal distribution. Warm air is blown into rooms by registers in rear walls. Existing electric heaters are retained, although with greatly reduced output power, to prevent cold downdraughts during the very coldest times of the year and as a safety measure. As far as Stockholm county is concerned, the method is felt to be able to provide a potential benefit, in the form of a reduction in the requirement for electrical energy for heating and an increase in the heat sink for production of back-pressure power, of about 1.2 TWh/year, equivalent to about 7% of the counties total consumption of electricity. In order to obtain practical experience of the introduction of this method in good time, it is important that full-scale demonstration project is carried out. (authors).

36375 (CONF-890609–5) **Contamination of reflective foils in horizontal applications and its effect on thermal performance.** Cook, J.C. Jr.; Yarbrough, D.W.; Wilkes, K.E. Oak Ridge National Lab., TN (USA). 1989. 20p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. From ASHRAE annual meeting; Vancouver, Canada; 24-28 Jun 1989. Order Number DE89013047/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The increase in the emittance of aluminum foils due to measured amounts of laboratory dusting has been measured. These data and emittance measurements for specimens of horizontally positioned aluminum foil, taken from seven residential attics three to five years after installation, are reviewed. Modeling of the heat transfer across attic air spaces bounded by aluminum foil provides predictions of the increase in heat flow with increased surface emittance. 10 refs., 5 figs., 5 tabs.

36376 (DOE/CE–0263) **Bibliography of the DOE building equipment research program.** USDOE Assistant Secretary for Conservation and Renewable Energy, Washington, DC (USA).

Building Equipment Div. Dec 1988. 164p. Sponsored by DOE Conservation & Renewable Energy. Order Number DE89013871/JAW. Available from NTIS, PC A08/MF A01 - OSTI; GPO Dep.

The Energy Conversion Equipment Program (ECEP) sponsors research directed at improving the efficiency of conversions equipment that uses conventional energy sources (primarily natural gas, oil, coal or electricity). Implementation of the efficiency improvements resulting from this research has the potential of saving 5.3 Quads of energy or about 10 percent of all the projected energy used in buildings in the United States in 2010. The mission of the ECEP is to increase the energy efficiency of building equipment by conducting long-term, high risk, generic research to advance the technical understanding of the basic energy use phenomena in both residential and commercial building equipment. The goal of ECEP research is to develop a technology that the private sector can draw upon for future development of energy efficient building equipment for improved utilization of scarce energy resources. The objectives of the program are: to develop an understanding of the inherent efficiency limits of conventional building equipment; to establish the feasibility of advanced technologies which can significantly improve energy utilization; and to develop the technology to a state of readiness where it can be used by others in design and utilization of present and future building systems. Program efforts are focused on generic technology-based research and development in which the private sector is not likely to engage because of limited resources, the high risk factors involved, and the long-term efforts required. Program elements are coordinated with national laboratories, universities, and private organizations such as the Electric Power Research Institute and the Gas Research Institute.

36377 (DOE/IR/05106–T68) **Financial options for energy efficiency: A program to reduce the energy cost burden on low income residents.** Urban Consortium for Technology Initiatives (USA). Energy Task Force. Jan 1983. 87p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract FG02-78IR05106. Order Number DE89013832/JAW. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

A significant proportion of New Orleans' residents have incomes below poverty level and often rent living quarters in houses which were built over eighty years ago. Original building designs often included passive cooling elements such as high ceilings, functioning transoms, shutters, overhangs and proper site orientation. Subsequent modifications which include installation of air conditioning, lowered ceilings and security devices have negated many of the effects of the original passive design features. Infiltration is also a significant problem during both heating and cooling seasons. Increasing utility costs coupled with recent reductions in energy cost assistance programs impose a severe stress on residents with lower incomes. A potential solution to these increasing cost burdens was to combine simple physical weatherization techniques with more efficiency in the use of energy in the home. This project sought to demonstrate the effectiveness of low cost and no cost weatherization techniques in New Orleans and to illustrate that such investments can be recovered in a short period of time through reduced energy bills.

36378 (DOE/OR/21697–1) **Thermal properties of wood and wood panel products for use in buildings.** TenWolde, A.; McNatt, J.D.; Krahn, L. Forest Service, Madison, WI (USA). Forest Products Lab. Jun 1988. 42p. Sponsored by DOE Energy Research. DOE Contract AI05-87OR21697. Order Number DE89014125/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report provides a review and evaluation of currently available information on the thermal conductivity and specific heat of wood building materials. We derived a linear equation for thermal conductivity of solid wood as a function of density and moisture content from data in the literature and used this to provide estimated conductivity values for various types of hardwoods and softwoods. Far fewer data exist for the thermal conductivity of wood panel products. Current design values appear to be based on the premise that the conductivity of plywood is the same as that of solid wood of the same species, but the few reported results from the measurements indicate a lower conductivity. More definite information exists on the conductivity of conventional particleboard and fiberboard, but additional conductivity measurements of plywood and some of the most commonly used flakeboards, such as oriented strandboard (OSB), are needed. Additional measurements of the specific heat are needed for all wood panel products. We discuss the special problems of measuring thermal properties of wood products with high moisture contents and the practical relevance of such data to building design and performance, and we conclude that thermal properties above fiber saturation are of little practical significance. The report contains the authors' recommendations for design values for thermal properties and for further research and additional measurements, as well as a bibliography. 33 refs., 14 figs., 10 tabs.

36379 (DOE/SF/17714–T1) **[Weatherization assistance program]: Annual report.** Ackco, Inc., Boulder, CO (USA). 26 Jun 1989. 31p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC03-88SF17714. Order Number DE89014122/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This annual report focuses on the twenty subgrantees that were monitored by ACKCO, Inc. from September 30, 1988 to September 29, 1989. In the following analysis, ACKCO, Inc. will proceed from the general to the specific; that is from: generic findings (weaknesses) among the 20 subgrantees; to summary of findings by State at the subgrantee level; to recommendation for technical assistance by Region and State; and to price analysis of weatherization materials purchased by region, State and subgrantee.

36380 (ETDE/CA-MS–8903) **Remote and northern energy-efficient house design catalogue.** Department of Energy, Mines and Resources, Ottawa, ON (Canada). Remote Community Demonstration Program. 1989. 126p. (CE–02649). Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $ PRICES UPON REQUEST, FUNDS CAN.

This catalogue documents the design and construction of energy-efficient housing in Canada's northern and remote regions. The first part of the catalogue is a primer of construction and design principles, including regional and local considerations for northern housing; the requirements of design and construction details suited to severe climates; heating and ventilation system options; and different options for improving the energy-efficiency of existing homes. The second part offers a variety of energy-efficient house designs and construction techniques. Each original design includes a floor plan, general information on construction and operation, performance information if available, specific features and details, cost of materials and construction, and a review by the residents. Retrofit projects are described with their history, with the costs and paybacks given. A glossary is also included. 54 figs.

36381 (ITL–8509, pp. 475-479) **OPENSOL. Software for the optimization of sizing and control of complex heating systems with long-term heat storage.** Lenoir, Y. (Ecole Nationale Superieure de Mines de Paris, Paris, France); Sneed, C. Intertask Ltd., Ottawa, ON (Canada). 1985. (In French). (CONF-850905–: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG–89-00267). In *Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The solution devised for consistent prompt optimization of the collection and distribution of resources for heating and production of domestic hot water has been the subject of original theoretical developments. The OPENSOL program is structed as a sequence of calculation diagrams to which work files and data files are assigned during the interactive exchanges with the user during the progress of an operation. OPENSOL consists essentially of three modules with the following three functions. The sizing of all dimensions affecting the thermal performance of the building and its heating installation, are optimized using the method of the steepest path, except for the power of the device consuming commercial energy, which is limited by a MINMAX algorithm. Secondly, the annual management of the solar (or climatic) energy collection and storage complex are optimized subject to limitation by a maximum available power value. The annual command function takes the form of a sequence of high-level variables (actualized marginal prices for stored

energy, threshold, and specified temperatures for distribution of collected energy between main storage and domestic hot water) and a maximum commercial power value, which serve to inform the optimum short-term and immediate commands. Lastly, it allows simulation using commands developed with more cumbersome simulation models than those that can be used for optimizations. The program can be used to calculate sub-optimum commands by switching to extreme strategies. OPENSOL is written in FORTRAN 77 and stored under UNIX. 9 refs., 8 figs.

36382 (ITL–8509, pp. 448-455) **Optimization of a combined heat pump/storage system with solar or convective heat collectors.** Franck, P.A. (Chalmers Univ. of Technology, Goeteborg, Sweden); Berntsson, T. Intertask Ltd., Ottawa, ON (Canada). 1985. (In English and French). (CONF-850905–: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG–89-00267). In *Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Results are presented of a computer simulation of whole heating system for space heating in large multifamily houses or small district heating systems. The system consists of a heat collector, which either is an ambient-air natural convective collector or a solar collector, a heat store with vertical pipes in the ground, and an electrically driven heat pump. The most important design parameters from both a technical and an economic point of view are the sizes of the collector, the storage, the heat pump, and the way the system is controlled. The influence of these parameters on the annual coefficient of performance and heat supply ratio has been obtained with computer simulations and is discussed. It is shown how this influence can be presented in a generalized way. With the aid of the technical results, an economic optimization is made both in the case of ambient air and solar collectors. The optimum is in both cases flat but sensitive to the combination of the system parts. A sensitivity analysis on the optimum is made to show the influence of investment and energy costs. Finally, the systems are compared with a heat pump without storage, which is found to be somewhat more economically advantageous at current cost levels. 3 refs., 9 figs., 1 tab.

36383 (ITL–8509, pp. 409-415) **Integrated thermal storage in energy systems for Canadian low energy houses.** Allen, G. (Allen-Drerup-White Ltd., Toronto, Canada); Kani, M. Intertask Ltd., Ottawa, ON (Canada). 1985. (In English and French). (CONF-850905–: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG–89-00267). In *Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This paper describes the design and predicted performance of a multi-functional integrated mechanical system for low energy houses that is capable of providing space heating and cooling, domestic hot water (DHW) heating, grey water heat recovery, and continuous ventilation with exhaust air heat recovery. Excess heat is used to melt a small ice storage tank, which in turn is kept cold by a heat pump transferring energy to a hot water tank (which provides DHW and hydronic space heating). Detailed hour-by-hour computer simulations using the ENERPASS program were performed and results are presented as annual heating load and energy consumptions, and summer and winter temperature profiles. Energy use, when compared to a house built to National Building Code Standards with electrical resistance heating, was over 10 times lower. 3 refs., 4 figs., 1 tab.

36384 (LBL–25363) **Energy use in buildings: The US experience and lessons for China.** Levine, M.D.; Adamson, B. Lawrence Berkeley Lab., CA (USA). Jun 1988. 10p. Sponsored by DOE Management & Administration. DOE Contract AC03-76SF00098. (CONF-8806261–1: Chinese/American symposium on energy markets and the future of energy demand, Nanjing, China, 22-24 Jun 1988). Order Number DE89014891/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This paper covers three topics concerning energy use in buildings. Its main focus is that of energy use in buildings in the United States. A second section describes some of the recent results of work by one the authors (BA) on energy performance of residential buildings in China. The third section contains suggestions for ways in which Chinese and US researchers could establish fruitful collaborations on energy use in buildings. 8 refs., 3 figs.

36385 (LBL–25686) **WINDOW 3.1: A PC program for analyzing window thermal performance: Program description and tutorial.** Lawrence Berkeley Lab., CA (USA). c Oct 1988. 19p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC03-76SF00098. Available from Windows and Daylighting Group, Applied Science Division, Lawrence Berkely Laboratory, 1 Cyclotron Road, Berkeley, CA 94720.

WINDOW 3.1 is a public-domain computer program developed by the Windows and Daylighting Group at Lawrence Berkeley Laboratory for analyzing heat transfer through window systems. The program uses an iterative technique to calculate the one-dimensional temperature profile across a user-defined window system. From this data, window system performance indices, e.g., U-value and shading coefficients, are calculated. WINDOW 2.0, incorporates several technical additions and many new user-friendly features, while continuing to provide a consistent and versatile heat transfer analysis method. The user can vary environmental conditions, window tilt, number of glazing layers, layer properties (thermal infrared, solar and visible optical properties, and thermal conductance), gap widths, composition of gap gas or gas mixture fill, and spacer and frame materials. 7 refs., 3 figs.

36386 (LBL–26816) **Comparison of conventional mixing and displacement air conditioning and ventilating systems in US commercial buildings.** Sepppanen, O.; Fisk, W.J.; Eto, J.; Grimsrud, D.T. Lawrence Berkeley Lab., CA (USA). Feb 1989. 39p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC03-76SF00098. (CONF-890609–2: ASHRAE annual meeting, Vancouver, Canada, 24-28 Jun 1989). Order Number DE89009056/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

During the last few years, a new displacement air distribution system with low velocity air supplied directly to the occupied zone and a displacement flow in the floor-to-ceiling direction has been introduced into office buildings in the Scandinavian countries. The purpose of this study was to evaluate displacement air distribution systems and compare their performance to the performance of traditional variable and constant air flow systems in US office buildings. The loads of a typical large US office building were calculated in four representative US climates (Minneapolis, Seattle, Atlanta, El Paso) with the DOE-2.1C buildings simulation program. The hourly loads and hourly weather data were used as inputs for new computer programs that simulated system performance. Energy consumption, air quality, thermal satisfaction, and the cost of the systems were calculated for three buildings zones (south, north, core) in each climate. The displacement systems were simulated using results from recent laboratory measurements. The results indicate that displacement systems generally yield superior air quality and thermal comfort compared to conventional systems with air recirculation. The energy consumed by displacement systems with heat recovery or VAV flow control was similar to the energy consumption of conventional air distribution systems operated with recirculation. However, the first cost of displacement systems is substantially higher than the first cost of conventional systems when the maximum cooling load exceeds 13 Btu/h-ft^2 (40 W/m^2) and cooling panels are required. The energy consumption of the traditional VAV systems was low. However, indoor air quality can deteriorate significantly if the combination of minimum supply air flow and minimum outdoor air entry into the air handler do not bring an adequate amount of outdoor air to each region of the building. 29 refs., 11 figs., 7 tabs.

36387 (ORNL/FTR–3251) **[Discussion of domestic refrigerator/freezer (R/F) design for nonazeotropic refrigerant mixtures**

(NARMs), Hannover, W. Germany, and visit to Kassel, W. Germany, May 2–5, 1989]: Foreign trip report. Sand, J.R.; Vineyard, E.A. Oak Ridge National Lab., TN (USA). 18 May 1989. 14p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. Order Number DE89014748/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The purpose of this trip was to meet with Dr. H. Kruse at the University of Hannover and discuss a domestic refrigerator/freezer (R/F) design for nonazeotropic refrigerant mixtures (NARMs), inspect a R/F modified to work with NARMs, and acquire the rational and computer codes for modeling NARM R/F performance for this design.

36388 (ORNL/FTR–3291) **[International Energy Agency third experts meeting of Annex 20 on Airflow patterns within buildings, May 30–June 2, 1989, Aalborg, Denmark; June 1, Aalborg University, Denmark; June 5-6, Taastrup, Denmark]: Foreign trip report.** Harrje, D.T. Oak Ridge National Lab., TN (USA). 9 Jun 1989. 9p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. Order Number DE89014233/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The third experts meeting of Annex 20, Airflow Patterns Within Buildings, took place on May 30–June 2, 1989 in Aalborg, Denmark. The operating agent, A. Moser (SW), introduced two new countries to the Annex: France and West Germany, bringing the total Annex participation to 3 countries with 29 experts present. Subtask I, Single-Room Air and Contaminant Flow, is being led by T. Lemaire (NL) and emphasizes test room flow modeling and multicountry intercomparisons for a number of specified test situations. Improved airflow models is a prime goal. Subtask II, Multizone Air and Contaminant Flow and Required Measurement Techniques, is being led by C.A. Roulet (SW). The emphasis in that task, where the US is directly involved, includes flow through large openings, simulated use of doors and windows, contaminant movement, multiroom ventilation efficiency, multizone airflow measurement methods and enhanced leakage distribution measurement methods, and data bases and data sets. Laboratory visits emphasized test room facilities (Aalborg University) and multitracer airflow measurements (Technologist Institute). The Annex is making excellent progress toward its stated goals.

36389 (ORNL/FTR–3296) **[Working meeting of the International Energy Agency Annex 14 on Working fluids and transport phenomena in advanced absorption heat pumps, May 28-30, 1989, Stockholm, Sweden; May 31, 1989, Nykoping, Sweden; June 5, 1989, Stuttgart, West Germany; June 6, 1989, Essen, West Germany; June 7, 1989, Munich, West Germany]: Foreign trip report.** DeVault, R.C. Oak Ridge National Lab., TN (USA). 21 Jun 1989. 14p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. Order Number DE89014231/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The second national team meeting of the International Energy Agency Annex XIV: Working Fluids and Transport Phenomena in Advanced Absorption Heat Pumps was held in Stockholm, Sweden. Japan is the operating agent for Annex XIV, with Belgium, Denmark, Sweden, West Germany and the United States also participating. Participation by the US is beneficial by obtaining additional absorption fluids data not otherwise available and also by obtaining up-to-date knowledge of the research directions for the Japanese absorption research efforts. Noteworthy is the large effort being expended by the Japanese on this project, with 10 Japanese researchers attending the Annex XIV meeting. Also noteworthy was the inclusion of the ORNL Triple-Effect absorption cycle in the Japanese evaluation of 72 cycles conducted as part of Annex XIV, along with the statements that two separate projects to develop the triple-effect cycle are currently in the negotiation stage in Japan. The Japanese predict a 30+ % increase in cooling performance for the triple-effect cycle compared to any other cycle, including the "Ultra-Efficiency" double-effect machines recently developed in Japan. Visits to Swedish and West German research organizations and laboratories were informative. The most often asked questions at all locations were: "What is being done about CFC substitutes which do not harm the ozone layer?", and "What is being done to develop the technology to reduce CO_2 emissions?" (global warming concerns).

36390 (PB–89-150304/XAB) **Research and development on a 3-kW-class Stirling engine.** Suganami, T.; Fujiwara, M.; Sakai, M.; Koda, T.; Nomaguchi, T. Mitsubishi Electric Corp., Tokyo (Japan). 1988. 5p. Available from NTIS, PC EE05/MF A01.

Text in Japanese. Included in Mitsubishi Denki Giho, Vol. 62, No. 10, 81-84(1988).

The Corporation has developed a 3-kW-class displacer-type Stirling engine for the Moonlight Project (an energy-conservation project funded by the Japanese Ministry of International Trade and Industry). The engine, completed in the last year of the project, boasts a thermal efficiency of 37.3%, the world's highest. It has been established as a high-efficiency, low- noise engine with clean, low-pollution exhaust. The Corporation has also developed a Stirling-engine-driven heat pump that is highly efficient, demonstrating the suitability of the Stirling engine for such applications.

36391 (PB–89-167332/XAB) **Potential of electric heat pumps for heating water in South Africa.** Johannsen, A.; Kaiser, G. National Mechanical Engineering Research Inst., Pretoria (South Africa). Heat Mechanics Div. 1987. 18p. Available from NTIS, PC EE04/MF E04.

The objective of the project was to investigate the possible application of electrically operated heat pumps in various water-heating schemes and to obtain a quantitative assessment of the potential savings in energy in typical applications and for the country as a whole. The investigations included an analysis of typical heat-pump systems, long-term monitoring of the performances of two heat-pump installations, development of a performance model, simulation of performance in different regions of South Africa, as well as case studies of two industrial systems. Economic factors affecting the application of heat pumps are also discussed.

36392 (PB–89-172209/XAB) **Business guide to energy performance contracting. Final report.** Rosenberg, M. Technical Development Corp., Boston, MA (USA). May 1984. 63p. Available from NTIS, PC A04/MF A01.

The value of performance contracting is that it helps building owners to implement energy-efficiency measures by providing them with the expertise and financial backing to do so. Typically, the performance contractor agrees to be responsible for engineering design, equipment procurement, installation, financing, and maintenance. The building owner's payments are scaled to actual reductions in energy costs directly related to the project. The report discusses different types of energy-performance contracts, including lease, lease/purchase, shared savings, and energy service agreements and includes discussions of the advantages and disadvantages of each. It also includes information on how to solicit and evaluate performance-contracting proposals and how to negotiate and implement an energy-performance contract.

36393 (PNL-SA–16585) **Performance monitoring protocols.** Stoops, J.L. Pacific Northwest Lab., Richland, WA (USA). May 1989. 14p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC06-76RL01830. (CONF-8905123–3: End use load information and application conference, Syracuse, NY, USA, 16-17 May 1989). Order Number DE89014450/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Clearly, nothing can replace hard data when it comes to the demonstrating or evaluating the effectiveness of any energy-related conservation or resource management effort. However, what is not clear is how data should be collected and even which data needs to be collected. Data collection becomes an even more critical issue of individual projects separated by time and space but with some technical overlap are to be compared. Past efforts at these comparisons have revealed that such a comparison is next to impossible because of the wide variability of the instrumentation protocols and experimental procedure applied in each effort. The work flow in performance monitoring is the same as that of standard experimental procedure because of similar requirements for completeness and accuracy. First, the questions to be answered about a system or potential problem must be clearly defined and analysis methodologies to achieve the answers identified. Next, an instrumentation and data collection plan is developed and the equipment is installed. Data are then collected and analyzed to answer the questions. Finally, the answers are applied to derive informed decision making. Efforts under the auspices of ASHRE and ATM are proceeding to

develop consensus standards for the energy monitoring of both residential and commercial buildings. Both of these standards are focused on the process necessary to develop a protocol applicable to a specific project. However, they also include a set of minimum elements essential for completeness in any metering project.

36394 (PW–1988) **Thermal environment evaluation.** Tilley, B. Public Works Canada, Ottawa, ON (Canada). 1988. 98p. (In French and English). (MICROLOG–89-01930). Available from Canada. Public Works Canada, Information Research & Library Services, Sir Charles Tupper Bldg., Confederation Heights, Ottawa, ON, Canada K1A 0M2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This document describes interior thermal environment analysis and the techniques involved at three applicable stages of evaluation. They range from the study of plans and archives to physical measurement with sophisticated instrumentation. Environmental factors that influence the thermal state of the building occupant are measured. The occupant's perception of the thermal environment may also be investigated. One of the most important building functions is to isolate the occupants from adverse exterior thermal conditions and provide a productive and healthy interior environment. The thermal environment is determined by clothing level, activity level, air velocity, ambient air temperature, mean radiant temperature and moisture level. Since an optimal thermal environment may not be optimal in terms of the building's energy efficiency, the evaluation process will have to draw upon expertise in energy use and other disciplines at the stage where solutions are recommended. 16 refs., 4 figs., 2 tabs.

36395 (PW–D38) **Thermographic inspections of building enclosures.** Colantonio, A. Public Works Canada, Ottawa, ON (Canada). 1988. 125p. (In English and French). (MICROLOG–89-02020). Available from Canada. Public Works Canada, Information Research & Library Services, Sir Charles Tupper Bldg., Confederation Heights, Ottawa, ON, Canada K1A 0M2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This document describes the use of thermographic technology to examine the heat loss of a building enclosure, to identify damaged areas, and determine the causes and extent of enclosure deterioration. Three stages of investigation were developed: the thermographic level locates thermal anomalies; the thermologic level identifies problems and recommends remedial action; and the building science level determines the causes and effect of building problems and provides recommendations for correction. The equipment and methods used are described in detail. Background information on infrared radiation, heat transfer, and moisture migration are provided. A glossary and a bibliography are included. 17 refs., 1 tab.

36396 (PW–D39) **Thermal resistance measurement.** Colantonio, T. Public Works Canada, Ottawa, ON (Canada). 1988. 54p. (In English and French). (MICROLOG–89-01929). Available from Canada. Public Works Canada, Information Research & Library Services, Sir Charles Tupper Bldg., Confederation Heights, Ottawa, ON, Canada K1A 0M2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This document provides evaluation techniques to determine the in-situ thermal resistance of wall and roof assemblies. Such techniques are important because the desired properties of a building can differ from those specified due to inferior materials, poor workmanship or degradation over the life of the structure. Instrumentation and test methods used to determine heat flow through the enclosure assembly are described, based upon Canadian experience. These methods have three stages of evaluation: preliminary assessment, simple measurement techniques, and specialized in-depth monitoring. 11 refs., 1 tab.

36397 (SAND–89-1595C) **Evaluation of commercially available lighting design software.** McConnell, D. Sandia National Labs., Albuquerque, NM (USA). 1989. 27p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-890736–28: 30. annual meeting of the Institute of Nuclear Materials Management, Orlando, Florida, USA, 9-12 Jul 1989). Order Number DE89014172/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

For years the lighting industry has manually entered and manually performed calculations on the photometric data that is necessary for lighting designs. In the past few years many lighting manufacturers and private lighting design software companies have published computer programs to enter and perform these calculations. Sandia National Laboratories (SNL), and other interested organizations, are involved in outdoor lighting designs for Closed Circuit Television (CCTV) that require lighting design software programs. During the period when no commercial lighting design software programs existed, SNL first used a government agency's program and then developed an in-house program. The in-house program is very powerful but has limitations, so it is not feasible to distribute it to interested organizations. This program has been used extensively for many high security outdoor lighting design projects. There is still a demand for lighting design programs, so SNL has ordered several that are commercially available. These programs are being evaluated for two reasons: (1) to determine if their features are adequate to aid the user in lighting designs, and (2) to provide that information to SNL and other organizations. The information obtained in this paper is to be used to help an end user decide if a program is needed, and if so, to choose one. This paper presents the results of evaluations performed. 5 refs., 6 figs., 3 tabs.

36398 (TCI–8705) **Rural and native housing demonstration program. Report and construction manual.** Couture, R.; Rousseau, J. Thermocube, Inc., Longueuil, PQ (Canada). 1987. 45p. (MICROLOG–88-06474). Available from Canada Mortgage and Housing Corporation, Annex Bldg., 628 Montreal Rd., Ottawa, ON, Canada K1A 0P7; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

A proposed design is presented for a house suitable for construction in remote areas of Canada. The house is primarily of modular construction, utilizing prefabricated insulated panels. The panels are made of waferboard with fiberglass insulation inside (R-28 for the walls, R-40 for the roof), and are factory-assembled with staples and adhesives. They are small enough to be handled by four men without needing mechanical aids such as cranes. The house can be built on several types of foundation, and is designed for easy and rapid construction by unskilled labor. Specifications are given for the manufacture of the panels, and directions are included for assembling the panels into an 80 square meter (3-bedroom) house. Cost of the panels for such a house is estimated at $8500.00. 18 figs.

36399 (TIR–440-U-498) **Large scale illumination using prism light guide and a Vortek lamp.** Whitehead, L.; Camm, D. TIR Systems Ltd., Burnaby, BC (Canada). 1987. 29p. (CE–02639). Available from Canadian Electrical Association, Research & Development, Suite #500, One Westmount Square, Montreal, PQ, Canada H3Z 2P9; $75.00 NON-MEMBERS; MEMBERS: PRICES UPON REQUEST, FUNDS CAN.

A greenhouse was illuminated by using a 31 m prism light guide fed from one end by a Vortek arc lamp operating at approximately half of its maximum rated output of 100 kW. Because the lighting system has only one light source, maintenance and waste heat recovery can be done at one location. Of 100 kW electrical input, 75 kW is recoverable as heat via heat exchangers. Of the remaining energy, 53 millieinsteins/s of Photosynthetically Active Radiation (PAR) enters the prism light guide, and 36 millieinsteins/s is emitted from the two emitting surfaces to illuminate the plants below. Economic analysis suggests that in large scale production, Vortek lamps coupled to prism light guides have the potential to provide a cost effective method of indoor plant illumination, as compared to conventional metal halide or high pressure sodium lighting. It is believed that this installation is a major advance in proving the technical feasibility of coupling high power sources to the prism light guide. 11 figs., 1 tab.

36400 (UNIES–8712) **Basement condensation. Field study of new homes in Winnipeg.** MacInnes, C.; Robinson, T. UNIES Ltd., Winnipeg, MB (Canada). 1987. 107p. (MICROLOG–88-06478). Available from Canada Mortgage and Housing Corporation, Annex Bldg., 628 Montreal Rd., Ottawa, ON, Canada K1A 0P7; $N/C; MF

CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

A field investigation of Winnipeg houses was carried out with the three objectives of determining the causes of excessive basement condensation in new homes, recommending appropriate remedial action, and suggesting construction practices that would avoid or reduce such problems. 14 houses that either exhibited a moisture problem or illustrated some other detail relevant to the condensation question were examined. The moisture contents of air in the basements were the same as, or only slightly higher than, seasonal outdoor values for all but the wettest basements. The field observations imply that many Winnipeg houses, old and new, operate for part of the year with some interior concrete surfaces cool enough to promote condensation, yet little or no condensation occurs. However, new houses constructed during cold weather according to normal local building practices, with insulation applied on the interior over the full height of the concrete foundation wall, are susceptible to a significant condensation problem, particularly during the first summer of occupancy. The difference appears to be in the amount of drying experienced by the concrete since the time of construction. For new house basements in which problem condensation has occurred, it is recommended that the framed wall be opened up to expose the concrete, and that good drying conditions be provided in the basement for one to several months before the interior framed wall is restored. The basement condensation phenomenon could become more widespread if full-height insulation were to become more common across the country. Other mitigative or preventive construction practices suggested include insulation of foundations on the exterior, and installation of a properly sealed air/vapor barrier in the basement. 62 figs., 1 tab.

36401 (CONF-890790–2) **The US market for high-speed maglev vehicles.** Rote, D.M.; Coffey, H.; Johnson, L.; Daniels, E. Argonne National Lab., IL (USA). 1989. 9p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract W-31109-ENG-38. From 5. world conference on transport research; Yokohama, Japan; 10-14 Jul 1989. Order Number DE89013301/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Recent studies at Argonne National Laboratory have shown that the market for high-speed magnetically levitated vehicles in the US, and in the rest of North America as well, depends strongly on how the technology is implemented. As an upgraded railway technology, it would have important benefits. However, competition with airlines would tend to make the technology uneconomical. Designed as aerospace-type vehicles with special attention to low mass and optimal aerodynamic performance and integrated into airport/airline operations, the technology would complement rather than compete with airlines. The social and economic benefits of maglev technology are discussed, and the economic viability of maglev as an airline/aerospace technology is compared to that as a railroad technology. Governing factors for potential market size and geographic distribution are addressed in detail, and the expected principal routes are described. 8 refs., 3 figs., 6 tabs.

36402 (CONF-890793–1) **Estimating departure times from traffic counts using dynamic assignment.** Janson, B.N.; Southworth, F. Oak Ridge National Lab., TN (USA). May 1989. 20p. Sponsored by DOE Energy Research. DOE Contract AC05-84OR21400. From International conference on dynamic travel behavior analysis; Kyoto, Japan; 18-19 Jul 1989. Order Number DE89013024/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A dynamic traffic assignment algorithm and observed traffic counts are used to estimate the distribution of departure times in a trip matrix. The objective is to find the maximum entropy distribution of departure times by origin zone subject to observed traffic counts on a subset of network links. The procedure results in the estimated number of trip departures from each origin in 10-15 minute time intervals of the full analysis period. Such an analysis period will typically range from one to three hours long. We first review the dynamic assignment algorithm developed and tested in a previous paper, and then describe its use with traffic counts to estimate the departure times of a trip matrix. We present an application to a Pittsburgh network in which trip departures are estimated for each 10-minute interval of a peak-hour survey trip matrix. Computational advances such as parallel computing will enable the procedure to be run on large networks while counts are being monitored. Such an application may provide near real-time detection of temporal trip departure profiles by origin zone. 20 refs., 1 fig., 2 tabs.

36403 (DOE/IR/05106–T63) **Memphis Area Rideshare on-line information system.** Urban Consortium for Technology Initiatives (USA). Energy Task Force. Feb 1984. 93p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract FG02-78IR05106. Order Number DE89013828/JAW. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

Since the mid 1970s, there has been an evolution in data processing needs at regional ridesharing agencies. Initially, ridesharing programs were basically "areawide carpooling efforts" which stressed pre-planned commuter surveys and large-scale computerized carpool matching using batch mode procedures. However, experience gained in efforts to influence urban travel behavior has led to the adoption of comprehensive marketing strategies and personalized transportation brokerage techniques which are more responsive to commuter needs. With this changing emphasis, new data processing tools are needed which will support new ridesharing marketing strategies, not dictate them. As described in this report, the method taken at Memphis Area Rideshare to acquire data processing capabilities needed to support new marketing approaches involved development of an in-house, on-line multi-user system using POOLMATCH ridesharing software.

36404 (PB–89-150098/XAB) **Super high-speed magnetically levitated system approaches: practical use.** Matsuda, S.; Nakao, H.; Takemasa, H. Toshibe Corp., Tokyo (Japan). Principal Office. 1988. 4p. Available from NTIS, PC EE04/MF A01.

Text in Japanese; Included in Review, Vol. 43, No. 10, 798-801(1988).

The JR-MAGLEV, utilizing superconducting magnets, has been under development since 1970 with the manufacturing of a succession of trial vehicles such as the LSM 200, ML 100, ML 500 and MLU 001. In 1979, the ML 500 trial vehicle achieved a world-record speed of 517 km/h. This was followed by the MLU 001, which recorded a speed of 350 km/h as a 3-car formation in 1986 and 400 km/h as a 2-car formation with passengers in 1987. As a result of the satisfactory results obtained by the MLU 001, a prototype vehicle for commercial service, the MLU 002, was manufactured in March 1988 and is now under testing at the Miyazaki test track, with the aim of achieving a target operational speed of 420 km/h.

36405 (PB–89-163976/XAB) **Effects of road-surface properties on the fuel consumption of trucks and buses.** du Plessis, H.W.; Yorke-Hart, M.A. Council for Scientific and Industrial Research, Pretoria (South Africa). National Inst. for Transport and Road Research. 1987. 29p. (CSIR-RR–487). Available from NTIS, PC EE05/MF E05.

Summary in Afrikaans. Pub. in Proceedings of the Annual Transportation Convention (ATC 1987), Vol. 4C paper 4C/XII, 26 (Aug 1987); North American Continent sales only.

A study was undertaken to investigate the effects of road-surface properties on the rolling resistance (and hence fuel consumption) of medium-sized trucks and passenger buses. The coast-down technique was used and proved to be practical and repeatable. The results indicate that road roughness and tire pressure are both significant in determining rolling resistance. Road-surface properties can be expected to affect fuel consumption by as much as 20%. Typical tire-pressure increases could cause as much as 6% less fuel to be consumed on the same surfacing.

36406 (PB–89-163984/XAB) **Effects of road condition on the operating costs of buses.** du Plessis, H.W.; Visser, A.T.; Harrison, R. Council for Scientific and Industrial Research, Pretoria (South Africa). National Inst. for Transport and Road Research. 1987. 39p. (CSIR-RR–488). Available from NTIS, PC EE05/MF E05.

Summary in Afrikaans. Pub. in Proceedings of the Annual Transportation Convention (ATC 1987), Vol. 2A, paper 2A/VIII 36 (Aug

1987). See also PB–89-163976. North American Continent sales only.

The effects of roadway conditions on vehicle operating costs (VOCs) have been studied extensively in a number of major research projects in developing countries. The VOC models that resulted from these studies have found applications in road-management systems and in the economic evaluation of road projects. The National Institute for Transport and Road Research (NITRR) of the CSIR recently initiated a VOC study in Southern Africa, with the aim of developing suitable relations for local use. A pilot study indicated that roads displaying a wide variety of conditions would have to be studied. A bus operator in a developing region was then approached for assistance with data collection. Road networks in the area were measured for roughness and operating cost data were collected. These items were then related to the roughness data, and operating-cost relations were thus developed. Although many issues remain unresolved, results are promising and compare favorably with those reported from other studies.

36407 (PB–89-174221/XAB) **Planning techniques for intercity transportation services. Final report.** Fraval, F.D.; Burkhardt, J.E.; Menzer, R.E. Ecosometrics, Inc., Bethesda, MD (USA). Jul 1987. 115p. Available from NTIS, PC A06/MF A01.

This report describes a process to help the public sector better understand the roles of privately provided intercity services in rural and low-density areas. It presents several methodologies that can be applied to answer basic questions state and local officials might have about the cost of, and demand for, specific services. The document first sets forth a simple process for planning intercity passenger or freight services: identification of problems and opportunities, assessing the public interest, project analysis, and analysis of costs and benefits. The document then reviews methods to estimate the costs of intercity bus services, regional airline services, and rail branch lines. It discusses approaches to estimate ridership on intercity bus and airline services, as well as some qualitative factors which influence system demand. The techniques involve simple formulas which can be computed using a pocket calculator.

36408 (PB–89-174759/XAB) **History of the negotiations of the Washington Metropolitan Area Transit Authority.** Alper, J.M. Washington Metropolitan Area Transit Authority, DC (USA). Apr 1988. 186p. (WMATA–89-2). Available from NTIS, PC A09.

This work chronicles events leading to a recommendation that an agency be created by compact among Maryland, Virginia and the District of Columbia to provide a regional rail-transportation system. The body of text describes the process through which framers of the compact finally brought the recommendation to fruition. Many issues arose during the course of negotiations, but each was resolved satisfactorily, leading to a successful political instrument that has enabled the Washington Metropolitan Area Transit Authority to design and construct a rapid-rail transit system for the metropolitan area.

36409 (SAND–88-3334C) **Energy accommodation modeling of rarefied flow over re-entry vehicle geometries using DSMC [Direct Simulation Monte Carlo].** Bartel, T.J.; Hudson, M.L. Sandia National Labs., Albuquerque, NM (USA). 1989. 14p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-8906134–1: 24. thermophysics conference, Buffalo, NY, USA, 12-15 Jun 1989). Order Number DE89013525/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The influence of energy accommodation in the modeling of the gas/wall interaction is examined for rarefied flow over re-entry vehicle geometries using the Direct Simulation Monte Carlo (DSMC) algorithm. The reflected molecule's energy accommodation was varied while a uniform angular distribution was assumed. DSMC results are compared for the first time with flight data obtained from four tests using two different re-entry vehicle geometries. The altitude conditions vary from 58 to 113 km. The Knudsen number varied from less than 0.005 to greater than 10, indicating fluid conditions from the continuum to the free molecular regime. The ratio of the freestream stagnation temperature to the wall temperature was approximately 60. Surface heat fluxes and vehicle drag are compared between the flight data and the DSMC code predictions. The results indicate that a thermal accommodation coefficient less than 1.0 is appropriate for the transitional flow regime. Trends in the surface energy accommodation coefficient variation with altitude are discussed. 15 refs., 4 figs.

36410 (TVA/PUB–88/17) **Transportation rate services.** Tennessee Valley Authority, Knoxville, TN (USA). 1989. 22p. Sponsored by Tennessee Valley Authority. Order Number DE89014197/JAW. Available from NTIS, PC A03/MF A01 - OSTI.

Transportation costs represent a major portion of a firm's overall operating expenses. TVA's transportation rate experts have the most up-to-date information on transportation rates for all modes, as well as the capability to prepare waterway feasibility studies and help clients analyze transportation costs and improve transportation planning. This paper covers these topics and gives examples.

36411 (CANMET–5174) **Energy conservation in the industrial minerals sector. Comminution - Phase 3. Activity 4: monitoring and control of a dry grinding circuit using a particle size analyzer and programmable controllers.** Canada Centre for Mineral and Energy Technology, Ottawa, ON (Canada). 1987. 65p. (MICROLOG–89-01171). Available from Canada Centre for Mineral and Energy Technology, Technical Information Division, 555 Booth St., Rm. 342, Ottawa, ON, Canada K1A 0G1; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This report constitutes Part 3 of a study of energy conservation during comminution operations in the industry. The objectives of the study were to optimize the performance of a dry grinding circuit using a high efficiency classifier in a conventional dry milling circuit, to measure particle size on-line, and to monitor the production rate, energy consumption, and particle size with a personal computer. The activities discussed in this report comprise: examination of the performance of a high efficiency classifier in a conventional milling circuit; examination of the state of development of classifiers for cement grinding circuits; examination of the use of grinding aids and anti-static agents in dry grinding circuits; monitoring and control of a dry grinding circuit using a particle size analyzer and programmable controllers; evaluation of the use of dry autogenous grinding of silica to produce coarse size sand grade product; and development of the technology necessary to optimize the comminution of mica. Important energy savings, increase in classification efficiency, and increase in production rate have been achieved. 22 figs., 4 tabs.

36412 (DOE/ID–10204-2) **Combustion research opportunities for industrial applications: Phase II.** Chace, A.S.; Hazard, H.R.; Levy, A.; Thekdi, A.C.; Ungar, E.W. USDOE Idaho Operations Office, Idaho Falls, ID (USA); Taratec Corp., Columbus, OH (USA). 31 May 1989. 131p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC07-76ID01570. Order Number DE89014157/JAW. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

This report completes a two-phase project to identify critical combustion technology research and development opportunities which can provide substantial energy savings and other process improvements in major industrial sectors. The major energy intensive industries considered during this project are primary Metals, Chemical, Petroleum and Coal Products, Stone, Clay and Glass, Paper, and Food. The reader will find a discussion of project concepts including an analysis of the needs and justification for each project. Projects recommended for development are documented in a manner which will facilitate rapid initiation of projects by DOE management or others responsible for improving combustion systems. Although an analysis of each project is contained in this report, a detailed development plan coordinating future development activities needs to be established in any follow-on effort. During the second phase of this project, the Phase I research opportunities were further defined and evaluated. Two project areas, namely improved heat flux and reduction in heat losses, are recommended for development which incorporate research opportunities with high potential for success. 3 refs., 5 figs.

36413 (EPRI-CU-6376) **Assessment of unitary cool storage systems: Final report.** Ayres, J.M.; Lau, H. Electric Power Research Inst., Palo Alto, CA (USA); Ayres Ezer Lau, Inc., Los Angeles, CA (USA). c Jun 1989. 286p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Cool storage systems in large commercial and industrial buildings have been proven to be an effective load management technology for electric utilities and a cost effective investment for their customers. The development of small cool storage systems designed for houses and small commercial buildings has been hindered by a lack of technical and economic data. This report records the status of this technology, evaluates manufacturers data and identifies the needs for additional research and development work. A survey of the cool storage industry was conducted and five manufacturers were identified to have products suitable for residential and small commercial applications. Their equipment and performance data were documented and evaluated. Seven utilities and other organizations that were testing and/or field monitoring unitary cool storage systems were visited, their testing programs were documented. It was found that most of the products are still in the development and demonstration stage and only one manufacturer had its product in production. Limited test performance data were available from manufacturers. Test results show that residential cool storage systems are able to effectively shift electric demand from on-peak to off-peak hours, but they are currently not cost effective. A residential/unitary cool storage R and D Workshop was conducted by EPRI at Dallas, Texas on May 3-4, 1988, the meeting minutes are included in this report. 82 figs., 24 tabs.

36414 (ETDE-mf-9788055) **Waste heat recovery from a sulfuric acid plant.** Jost, J.; Wentzel, H.U. Sachtleben Chemie G.m.b.H., Duisburg (Germany, F.R.); Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Projektleitung Energieforschung; Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.). [1988]. 27p. (In German). Order Number DE89788055/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

It is the aim of this project to use the waste heat from SO_3 absorption (temperature level at about 65°C) which has not been used so far, for long-distance heating by process adaptations to a temperature level of above 90°C. For this purpose a number of separate tests was carried out to re-determine the dimensions of the packed bed and the quantities of the circulating washing acid, to develop new final absorbers and to re-design the pertinent acid cylces. In this connection material problems occurred - due to the increased corrosiveness. The internal structural alteration of the plant was carried out step-by-step. The findings obtained are used for the construction of a demonstration plant.

36415 (ITL-8509, pp. 345-349) **Precooling vegetables using a block of ice produced by winter coolness.** Vigneault, C. (Engineering and Statistical Research Inst., Agriculture Canada, Ottawa, ON, Canada); Gallichand, J.; Jacob, G. Intertask Ltd., Ottawa, ON (Canada). 1985. (In English and French). (CONF-850905--: ENERSTOCK '85 - 3. international conference on energy storage for building heating and cooling, Toronto, Canada, 22-26 Sep 1985;MICROLOG-89-00267). In *Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Proceedings.* Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, Canada K1A 0E4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

A 250-ton block of ice was made using winter coldness by superimposing successive thin layers of ice. This block of ice was stored in an insulated building and was used to precool vegetables. The results obtained were compared with those of a conventional water-based precooling system powered by a compressor. The quality of the water and the produce, the energy efficiency, and the economic aspects of both systems were compared. The results demonstrated that the system using the block of ice as a cold source had definite advangtages in all areas. However, certain parts of the system, such as the recirculation of the water flow onto the ice, must be improved. 3 refs., 4 figs., 1 tab.

36416 (ORNL/TM-11076) **Laboratory testing of a fluidized-bed dry-scrubbing process for the removal of acidic gases from a simulated incinerator flue gas: Final report.** Bradshaw, W.M.; Krishnan, R.P.; Young, J.M. Oak Ridge National Lab., TN (USA). Apr 1989. 56p. Sponsored by Department of Defense. DOE Contract AC05-84OR21400. Order Number DE89013760/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

A series of bench-scale tests was conducted to evaluate a dry, fluidized-bed, scrubbing process for removing acidic gases from incinerator flue gas. The acidic gases studied were sulfur dioxide, hydrogen chloride, and phosphorus pentoxide. These gases were found to react readily with lime in a bubbling bed operating at 540°C (1000°F). Superficial gas velocity, bed temperature, bed depth, sorbent type, and sorbent utilization strongly affected the degree of acidic gas removal. Sorbent utilization was inhibited by reaction product occlusion of the particle surface. 7 refs., 7 figs., 3 tabs.

36417 (ORNL/TM-11114) **Bristol Babcock DPC 3330 controller evaluation.** Whitus, B.R. Oak Ridge National Lab., TN (USA). Apr 1989. 25p. Sponsored by DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89013759/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Tests were performed on a Bristol Babcock, Inc., Model DPC 3330 process control system to determine the suitability of both hardware and software for use as a low-cost distributed or stand-alone control system. Results of the hardware test verified that the hardware met or exceeded the company's published specifications for all test conditions except for the analog input common-mode rejection ratio (CMRR) measurement. The difference in measurement methods used during this test from the methods used by BBI was the reason for the difference in CMRR values. The unit was tested as a stand-alone controller because we did not have version 1.5 of Trolltalk-VAX software needed for the host VAX to support this unit. The software test consisted of evaluations of only those Advanced Communication and Control Language (ACCOL) modules that have been added to Bristol Babcock controllers since previous evaluations were performed by this group. Except for the logger and scheduler modules, all the ACCOL II modules evaluated worked as described in the reference manual. The logger module did not work because of an error in the early version of the firmware installed in the Beta unit tested, and this failure should not occur in production units. The scheduler module will work as described; however, some of the modes seem redundant or incorrect. The modular design of this system allows many possibilities for I/O point configuration example, a system with 20 analog inputs, 4 analog outputs, 16 discrete inputs, 16 discrete outputs, 2 counters, and 4 serial communications ports could be purchased for less than $7000 (hardware only). 4 figs., 12 tabs.

36418 (PB-89-163158/XAB) **Utilization potential of coal-combustion by-products: Somerset Power Plant case study. Final report.** Voycik, J.J.; Daley, J.R. Baker (Michael), Jr., Inc., Beaver, PA (USA). Jan 1987. 533p. Available from NTIS, PC A23/MF A01.

This report documents an 18-month study resulting in analyses of the economic potential of selling ash and ash-derived products from the Somerset Station Power Plant. Twelve different uses were examined for selling the by-products in western New York State and the Toronto Metropolitan market area. Among the applications: fly ash could be used as a partial replacement for cement in concrete mixtures, and as a mineral filler in bituminous pavements; bottom ash could be used as an anti-skid material for winter highway maintenance. The report includes an evaluation of coal-combustion by-product applications; a survey of nearly 270 potential users; chemical and physical testing of fly ash; an evaluation of technical specifications for possible market applications; and a determination of raw-material markets. All of this information became the basis for evaluating the potential markets for the by-products. Although the study was specifically aimed at marketing Somerset Station bottom and fly ashes, the methodology can be applied to other plants statewide. In addition, the report discusses a number of by-product applications not feasible for Somerset but which may be useful for other plants.

36419 (PB-89-173272/XAB) **Gas-based iron making: feasibility study. Final report, April 1985-December 1986.** Hemsath,

K.H.; Jeong, K.M.; Goldfarb, V.; Woodroffe, J.A.; Stickler, D.B. Indugas, Inc., Toledo, OH (USA). May 1987. 198p. Available from NTIS, PC A09/MF A01.

This paper explores the technical and economic feasibility of producing liquid iron and steel from finely ground iron ore through a natural gas based process. Raw materials represent 80% to 90% of the cost of present ironmaking processes. A substantial cost reduction can be achieved by changing the raw materials; metallurgical coke was replaced with natural gas, and pre-processed pellets were replaced with ground iron ore. The feasibility and performance of such natural-gas-based processes was compared to that of the blast furnace, the electric arc furnace and the direct-reduction processes. Variants of this new process were also explored. Utilization of pulverized coal and partial replacement of virgin iron units with scrap metal were considered. Related feasibility evaluations indicated that the new gas-based processes can reduce liquid metal manufacturing costs by 16% to 51%, while at the same time providing high purity iron.

36420 (UBA-FB–88-037) **Structural-engineering studies on the use of filter dusts from waste-incinerator flue gas cleaning as an aggregate bitumen in road construction.** Kluge, G. Asphalt-Labor A.J. Hinrichsen G.m.b.H. und Co., Wahlstedt (Germany, F.R.); Bundesministerium des Innern, Bonn (Germany, F.R.); Umweltbundesamt, Berlin (Germany, F.R.). Dec 1986. 99p. (In German). Available from Copy held by UB/TIB Hannover.

The present research work served to ascertain, by way of laboratory tests, whether it is possible to use filter dusts from waste incineration and salts from flue gas scrubbing in bituminous mixtures. In particular, the objective was to examine whether these waste-incineration products possess any properties which would adversely affect bituminous binders in the long term. For further clarification, proposals are made as to what additional tests would still have to be carried out in order to be able to use filter dust from waste incineration as fillertype material in bituminous base courses.

36421 (BFR-R–97-1988) **Uppsala heat pump. Evaluation of a district heating heatpump abstracting heat from sewage effluents.** Enstroem, H.; Solin, L. Swedish Council for Building Research, Stockholm (Sweden). 1988. 79p. (In Swedish). Order Number DE89776232/JAW. Available from NTIS (US Sales Only), PC A05/MF A01.

This project relates to performance evaluation of a large heat pump plant in Uppsala. The work forms part of a large group of projects concerned with large heat pumps. Performance evaluation has been carried out using data collected, calibrated and stored by the Energy Technology Instrumentation Center at the Royal Institute of Technology. The report presents the results from two years performance monitoring and operational experience. The measured data has been processed and presented in such a way as to allow conclusions to be drawn concerning plant performance and to allow comparison with other similar projects to be made. (authors).

36422 (CONF-890785–1) **Long-term degradation of dilute polyacrylamide solutions in turbulent pipe flow.** Choi, U.S.; Kasza, K.E. Argonne National Lab., IL (USA). May 1989. 10p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract W-31109-ENG-38. From Drag reduction international conference: additives and passive devices; Davos, Switzerland; 31 Jul - 3 aug 1989. Order Number DE89013275/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The long-term degradation behavior of 200 wppM polyacrylamide solution was studied experimentally in a closed recirculatory flow loop at temperatures of 7.2, 25 and 87.8°C. The degradation behavior was found to be strongly dependent on temperature. The results indicate that, with flow shear similar to that encountered in practical DHC pipe flow, polyacrylamide solutions are highly effective and have a reasonable lifetime at chilled water temperature of 7.2°C. 9 refs., 4 figs.

36423 (CONF-8809365–) **Sewage gas utilisation for cogeneration. Conference documentation.** Hessisches Ministerium fuer Wirtschaft und Technik, Wiesbaden (Germany, F.R.). Jan 1989. 130p. (In German). From 2. technical meeting on sewage gas utilisation for cogeneration; Muehlheim/Main, Germany, F.R.; 27 Sep 1988. Order Number DE89788277/JAW. Available from NTIS (US Sales Only), PC A07/MF A01.

The report presents experience and results of the operation of cogeneration aggregates in small and medium-sized waste water purification plants. Data were acquired on the operation of both cogeneration plants and sewage treatment plants. Among the subjects discussed are: Energy conservation, cost-profit calculation, optimisation, automation, and emission control.

36424 (DOE/CE/26561–T2) **Open cycle heat pump development: Phase II, District heating case study analysis: Progress report, October 1988–December 31, 1988.** DiBella, F.; Becker, F.E.; Glick, J. TECOGEN, Inc., Waltham, MA (USA). Apr 1989. 43p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract FG01-88CE26561. Order Number DE89012748/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A district heating system is proposed that uses low-level waste-energy sources, and a quasi open-cycle steam heat pump as a means of upgrading the energy in the form of hot water to use as a transport medium in the system. The use of a water-based, open-cycle heat pump appears to be extremely well suited in terms of its potential thermodynamic performance, cost, and environmental safety compared to more typical organic gased closed cycle systems. The Phase II case study provides a detailed analysis of a district heating system that utilizes the open cycle steam heat pump concept developed in Phase I. This quarterly report describes the energy audit performed on the heat source and heat sink.

36425 (DOE/IR/05106–T53) **Budgetary incentives for municipal energy management.** Urban Consortium for Technology Initiatives (USA). Energy Task Force. Jan 1985. 124p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract FG02-78IR05106. Order Number DE89014909/JAW. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

In most local governments, the potential dollar savings from improvements in energy efficiency do not provide a direct budgetary incentive for implementing energy management programs. This occurs because typical local governments; budgeting procedures obscure the logical connection between expenditures for energy projects and their resultant savings. This project, therefore, undertook to develop practical budgetary incentives for municipal energy management which would be directly incorporated into a municipality's departmental budgeting process. Realizing that the budgetary incentives developed would require the capability to track energy consumption and measure savings, the development of an energy management information system (EMIS) was simultaneously undertaken. By developing the budgetary incentives and EMIS in tandem, the EMIS was tailored to fit the needs of the budgetary incentives. To assure that the results of this project would be practical for Columbus and transferable to other local jurisdictions, their implementation was begun.

36426 (DOE/IR/05106–T59) **Municipal technologies: An assessment of energy technologies for the City of Chicago.** Urban Consortium for Technology Initiatives (USA). Energy Task Force. Dec 1982. 103p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract FG02-78IR05106. Order Number DE89013823/JAW. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

At a time when local government revenues are shrinking, municipal governments are faced with spiralling costs in the provision of essential city services and the operation of city departments and agencies. A primary reason for escalating costs is the rapidly increasing cost of energy. In 1979, the City of Chicago appropriated over $31 million for energy expenses and the 1982 appropriation was almost $73 million. The $73 million represents a 42% increase over the appropriation budget of 1981. An analysis of Chicago's 1982 energy budget identified the six largest energy consuming departments. The departments, in order of consumption, are Water, Streets and Sanitation, Police, Aviation, Public Works and Fire. The

major goal of the Municipal Technologies project was to demonstrate to city officials that energy consumption and related costs can be reduced by employing available and proven energy technologies. Emphasis was placed on providing information and technical assistance to those departments that were large consumers. A second goal was to encourage the departments to consider innovative financing approaches which can significantly aid them in purchasing expensive energy saving equipment. 7 refs., 1 tab.

36427 (DOE/IR/05106–T60) **Computer-assisted control for municipal water systems: Phase 1, Design for energy cost savings.** Lederer, C.C.; Dickerson, B.; Davanzo, A.C. Urban Consortium for Technology Initiatives (USA). Energy Task Force. Aug 1986. 106p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract FG02-78IR05106. Order Number DE89013824/JAW. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

The objective of this project was to study the feasibility of developing a computer-aided program for assisting the Systems Control Center staff in reducing the overall energy consumption for supplying water to the Detroit distribution system. 4 figs., 23 tabs.

36428 (DOE/IR/05106–T67) **Inhibition of respiration in activated sludge by high carbon dioxide concentration: A laboratory study.** Urban Consortium for Technology Initiatives (USA). Energy Task Force. Feb 1988. 33p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract FG02-78IR05106. Order Number DE89013831/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This research project investigated the degree to which the activated sludge wastewater treatment process is inhibited by high carbon dioxide concentration. This report presents the specific methods utilized in the performance of this research and the results obtained. Experiments were done in a CO_2 rich environment, using a modified large volume respirometer. Due to operating difficulties encountered when the respirometer was modified for elevated CO_2 concentrations, inhibition was measured by comparing rate of substrate removal in the experimental respirometer with that of the control. After calibrating the experimental method with known substrates and inhibitors, a number of experiments with high CO_2 concentrations were conducted. 3 refs., 5 figs., 3 tabs.

36429 (DOE/IR/05106–T76) **Retention and expansion program for high-energy use and cost-intensive business.** Urban Consortium for Technology Initiatives (USA). Energy Task Force. Dec 1986. 99p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract FG02-78IR05106. Order Number DE89013840/JAW. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

This report was prepared by the New York City Energy and Telecommunications Office, Office of the Mayor. The documented research and program development activities are part of Urban Consortium Energy Task Force efforts to tie energy efficiency and community development to the process of economic growth. The objective of this study is to develop a program of cost-effective economic assistance measures for energy-sensitive firms. The program aims to improve the prospects for business and job retention and attraction. Many urban areas such as New York City have been experiencing business flight to other locations, both nationally and abroad, where the cost of operation is ostensibly lower. Such urban areas and municipalities are seriously concerned about their continued viability as competitive economic entities. They want to maintain and expand their employment generating economic base. A successful program of firm retention and expansion would increase the rate of economic growth, ultimately expanding out-put, creating jobs and providing a broader municipal revenue base. This report details the process of developing such a program for a target group of New York City firms. 4 refs.

36430 (DOE/IR/05106–T89) **Innovative financing plans for privately owned waste-to-energy facilities: Volume 2, User's guide.** Urban Consortium for Technology Initiatives (USA). Energy Task Force. Dec 1984. 80p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract FG02-78IR05106. Order Number DE89013854/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This second volume of San Diego County's Applied Research into "Innovative Financing Plans for Privately Owned Waste-To-Energy Facilities" is designed as a user's manual and program listing for the financial analysis model developed during the project. Readers wishing a general description of financing alternatives applicable for waste-to-energy facilities and San Diego's experience in evaluating these alternatives should obtain the first volume in this series as noted on the last page of this User's Manual.

36431 (ECN–89-045) **Leaching characteristics of incinerator residues and potential for modification of leaching.** Netherlands Energy Research Foundation, Petten (Netherlands). Apr 1989. 20p. Available from Netherlands Energy Research Foundation ECN, P.O. Box 1, 1755 ZG Petten, Netherlands.

Leaching behaviour of municipal incinerator residues is examined using a number of different extraction procedures. The influence of pH is examined and the resuts compared with the predictions from a geochemical speciation model. Despite the heterogeneous nature of incinerator residues, the leaching behaviour is found to be very systematic. Diffusion tube studies are applied to examine the behaviour of leaching metals in the waste matrices and in waste-soil combinations. The method proves to be a valuable tool for studying leaching behaviour at the waste-soil interface. 8 figs., 18 refs., 5 tabs.

36432 (NRRI–89-11) **User's manual: GCOST: A gas cost-of-service program: Version 1.0.** Harunuzzaman, M.; Iyyuni, G. National Regulatory Research Inst., Columbus, OH (USA). May 1989. 61p. Available from OSTI - National Regulatory Research Institute, Columbus, OH.

The process of rate design for a gas distribution utility requires the use of cost-of-service studies. A cost-of-service study finds the various costs of serving all of a utility's customers, and allocates these costs to individual customer classes. Costs include investments in plant and equipment, operating expenses, and taxes. There are two distinct approaches that underlie cost-of-service studies. One approach is based on marginal costs and the other on embedded costs. The marginal-cost allocation can be defined as the incremental cost of adding a single customer to the system. The embedded cost is the customer's share of historical costs. Of the two approaches, the latter is easier to implement and traditionally has been used for rate-making purposes. GCOST is designed to perform cost-of-service studies using the traditional embedded cost approach. It accepts accounting, financial, and operating data as user input. It then allocates the various items of utility plant and operating expenses to each customer class according to user-specified methods. For each cost item or account, the user has the option of specifying an allocation method or formula. This flexibility allows the user to experiment with different combinations of allocation methods. GCOST is interfaced with a database management program, which is used to prepare input data files prior to running GCOST. The user has the choice of either using DBMGR, developed by NRRI, or the commercial software dBASE III PLUS, as the database management program. GCOST is designed for use on an IBM Personal Computer XT, AT, or compatible system.

36433 (PB–89-163026/XAB) **Guide to land treatment of municipal waste water in Illinois.** Skelton, L.W.; Hinesly, T.D.; John, S.F. Institute of Technology Assessment, Springfield, IL (USA). Jan 1989. 89p. Available from NTIS, PC A05/MF A01.

Waste water is a recyclable commodity. Organic matter, nitrogen, phosphorus, and micronutrients in waste water are generally harmful when discharged to lakes and streams, but these constituents have a positive economic value when applied under properly controlled conditions to vegetated soils. The guide provides an overview of planning for a land-treatment system. It first discusses the potential for land treatment in Illinois, how to modify lagoons for land treatment, economic considerations, health and environmental concerns, regulatory requirements, and public education. It then provides more technical information on land-treatment processes, site and waste-load evaluation, systems for agricultural production, the potential for supplemental irrigation in Illinois, general site management, and system monitoring.

36434 (PB–89-173314/XAB) **Final Environmental Impact Statement. Qaste reduction, recycling, and disposal alternatives. Recycling potential assessment and waste stream**

forecast. Volume 2. Seattle Engineering Dept., WA (USA). Solid Waste Utility. Jul 1988. 222p. (SEATTLE/SWU–88/1). Available from NTIS, PC A10/MF A01.

This Environmental Impact Statement represents the culmination of significant efforts by the Seattle Solid Waste Utility to develop a solid-waste management system. The EIS recommended, as a preferred alternative, that Seattle recycle 60% of its waste stream and dispose of the remaining non-recycled waste in a distant landfill. Volume II, the Recycling Potential Assessment (RPA) and Waste Stream Forecast, explored the potential for recycling in the City of Seattle. The RPA evaluated a whole array of waste reduction and recycling programs which the City could implement to achieve recycling levels of 45-78%. The RPA was a landmark document, the first of its kind to combine a sophisticated waste stream forecast and an analysis of the cost-effectiveness of waste reduction and recycling programs.

36435 (PB–89-179022/XAB) **Summary report of capacity at commercial facilities. Volume 1. Summary report.** Bassi, J. Versar, Inc., Springfield, VA (USA). 31 Jan 1989. 141p. Available from NTIS, PC A07/MF A01.

See also Volume 2, PB–89-179030.

This report provides capacity data on commercial hazardous waste-management facilities in all States. These data, along with those in the SARA State Capacity Reports, are designed to be used in conjunction with the Biennial Report data on waste generation to support the development of the States' Capacity Assurance Plan.

36436 (PB–89-179048/XAB) **Summary report of capacity at limited commercial and company-captive facilities. Volume 1. Draft report.** Bassi, J. Versar, Inc., Springfield, VA (USA). Feb 1989. 176p. Available from NTIS, PC A09/MF A01.

See also Volume 2, PB–89-179055.

This report provides capacity data on limited commercial and company captive hazardous-waste-management facilities in all States. These data are designed to be used in conjunction with the Biennial Report on waste generation to support the development of the States' Capacity Assurance Plan.

36437 (PB–89-179055/XAB) **Summary report of capacity at limited commercial and company-captive facilities. Volume 2. Draft report.** Bassi, J. Versar, Inc., Springfield, VA (USA). Feb 1989. 317p. Available from NTIS, PC A14/MF A01.

See also Volume 1, PB–89-179048.

The document provides Appendices for Vol. I of the same title. Appendices include: facility profiles for limited commercial facilities; company captive facilities; list of commercial facilities not included in SARA capacity data base; biennial report process codes; system classification hierarchy with translation from Treatment, Storage, Disposal, and Recycling(TSDR) survey and biennial report codes to SARA management categories; and translation from TSDR survey to biennial report for permit status and commercial status codes.

36438 (PB–89-179543/XAB) **Trial-Burn Observation Guide. Final report.** Vega, L. Kearney (A.T.), Inc., Alexandria, VA (USA). Mar 1989. 74p. Available from NTIS, PC A04/MF A01.

The purpose of the Trial Burn Observation Guide is to assist Regional and State regulatory staff in observing trial burns at hazardous-waste incinerators. The Guide provides background information about such tests and identifies other documents and personnel that can provide additional information or assistance.

36439 (PB–89-861108/XAB) **Sewage-sludge pretreatment and disposal. December 1981-February 1988 (Citations from the NTIS data base). Report for December 1981-February 1988.** National Technical Information Service, Springfield, VA (USA). May 1989. 160p. Available from NTISPC N01/MF N01.

See also PB–89-861116.

This bibliography contains citations concerning techniques and equipment utilized in the pretreatment processes and disposal of sewage sludges. Topics include resource- and energy-recovery operations, land disposal, composting, ocean disposal, and incineration. Digestion, dewatering, and disinfection are among the pretreatment processes discussed. Environmental aspects, including the effects on soils, plants, and animals are also presented. (This updated bibliography contains 323 citations, none of which are new entries to the previous edition.)

36440 (PB–89-861116/XAB) **Sewage-sludge pretreatment and disposal. March 1988-April 1989 (Citations from the NTIS data base). Report for March 1988-April 1989.** National Technical Information Service, Springfield, VA (USA). May 1989. 53p. Available from NTISPC N01/MF N01.

Supersedes PB–88-859509. See also PB–89-861108.

This bibliography contains citations concerning techniques and equipment utilized in the pretreatment processes and disposal of sewage sludges. Topics include resource- and energy-recovery operations, land disposal, composting, ocean disposal, and incineration. Digestion, dewatering, and disinfection are among the pretreatment processes discussed. Environmental aspects, including the effects on soils, plants, and animals are also presented. (This updated bibliography contains 77 citations, all of which are new entries to the previous edition.)

36441 (PB–89-861231/XAB) **Ocean waste disposal: outfall sewers. January 1977-April 1989 (Citations from the Selected Water Resources Abstracts data base). Report for January 1977-April 1989.** National Technical Information Service, Springfield, VA (USA). May 1989. 124p. Available from NTISPC N01/MF N01.

Supersedes PB–85-857662.

This bibliography contains citations concerning design, construction, and environmental effects of outfall sewers. Effects of domestic sewage on aquatic environmental and benthic ecosystems, and pollution control of outfall sewers are discussed. Monitoring of pollutants in sewage, sediments, and contaminants from sewers, and modeling of outfall sewers are also included. (This updated bibliography contains 213 citations, 45 of which are new entries to the previous edition.)

36442 Liquid fuels from the pyrolysis of municipal solid waste and its components. Evan, R.J. (Solar Energy Research Institute, Chemical Conversion Research Branch, 1617 Cole Blvd., Golden, CO (US)); Milne, T.A. v.v of Energy from biomass and wastes XI. Klass, D.L. Institute of Gas Technology, Chicago, IL (1988). (CONF-870364–: 11. IGT conference on energy from biomass and wastes, Orlando, Florida, USA, 16-20 Mar 1987).

The production of liquid fuels by the pyrolysis of municipal solid waste (MSW) requires an understanding of the composition of the liquid products and the factors which control the composition and yield. The analysis of pyrolysis oils by conventional techniques is difficult and time consuming because of their chemical complexity and polar and reactive nature. This makes the systematic study of process parameters difficult since changes in reaction conditions cannot be readily related to changes in product composition. Furthermore, the composition must be related to the chemical and physical properties of the oil which need to be known in the context of the potential fuel utilization or upgrading route. A method of oil characterization has been developed based on flash volatilization and direct molecular-beam, mass-spectrometric analysis utilizing multivariate statistical analysis techniques. This rapid data collection and analysis system has been used as a basis of compound class analysis, which characterizes collected pyrolysis oils by indexing the major classes of products, such as methoxyphenols, carbonyl compounds, anhydrosugars, hydrocarbons, etc. This experimental system is also used for real time sampling of pyrolysis products in the vapor phase for process parameter screening.

36443 (BBC–TP-8328-E) **Software development for a microprocessor based controller for ac-dc-ac diesel-electric freight locomotive power unit control.** Bonert, R.; Nixon, M. BBC Brown

Boveri, Inc., Pointe Claire, PQ (Canada). 1987. 350p. (MICROLOG–89-00634). Available from Transport Canada, Library and Information Centre, Place de Ville, Tower C, Ottawa, ON, Canada K1A 0N5; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The objective of the project was the development of advanced microprocessor software for locomotive control using the MICAS computer. The first step involved the development of a real time interactive simulation and test (RIST) system and support system for programming. The functions of the RIST system are to interface with the MICAS commputer and permit locomotive control inputs, simulate in real time the dynamic responses of the locomotive, and permit data collection and monitoring of the test software's performance. Locomotive simulation software package was also developed, permitting simulation of the engine governor response, the ac-dc-ac transmission and the locomotive wheel/rail interface condition variations, as well as data acquisition and display. The second step was the development and testing of MICAS control software. In this step, traction control software development explored various approaches to the detection and the correction of the wheelslip condition, and to configuring the ac-dc-ac drive control to improve adhesion performance. Monitoring and diagnostic software development explored the use of MICAS for data acquisition, storage, processing, and document provision or display. Diesel engine control software development optimized engine fuel efficiency by optimizing the engine operating point to the power demand. In addition, it explored the potential for fuel savings through the use of computerized multiple unit control. The third step in the program was the establishment of a laboratory facility to permit testing of the developed software on real locomotive hardware. The report contains extensive program listings and related documentation. 8 refs., 82 figs., 3 tabs.

36444 (PB–89-167282/XAB) **Engine operation on extended diesel fuels.** Falk, R.S.; Myburgh, I.S. Council for Scientific and Industrial Research, Pretoria (South Africa). National Mechanical Engineering Research Inst. 1987. 19p. Available from NTIS, PC EE04/MF E04.

The yield of diesel at the refinery can be increased by adding light hydrocarbons to diesel to produce 'light diesel' fuels. An ADE 236 diesel engine fueled with a light diesel was not able to complete a durability test owing to a fuel-related failure. Subsequent tests indicated that satisfactory durability could be achieved either by retarding the injection timing, or by retaining the standard injection timing and using an ignition-improved light diesel. A standard ADE 314 diesel engine fueled with light diesel satisfactorily completed a similar durability test. Operation on light diesel fuel caused a slight loss of power and certain components of the fuel-injection equipment showed increased wear.

36445 (PB–89-167308/XAB) **Effect of a light-diesel blend formulated by BP on the performance and durability of an ADE 314 diesel engine.** Falk, R.S. Council for Scientific and Industrial Research, Pretoria (South Africa). National Mechanical Engineering Research Inst. Jul 1987. 13p. Available from NTIS, PC EE04/MF E04.

The National Mechanical Engineering Research Institute (NMERI) carried out tests using blends of diesel with petrol and heavy naphtha, which indicated that the use of these fuels may be feasible. A durability test was then carried out on an ADE 236 diesel engine using a fuel blended to represent a 'worst case,' comprising 75% diesel and 25% hydro-treated straight run tops. The fuel was termed 'tops light diesel.' The test was terminated after 340 hours, which is equivalent to approximately 59,000 km, because of severe erosion of the pistons in the region of the combustion bowl. This erosion was caused by the poor combustion characteristics of the light diesel fuel. To overcome the problem of poor combustion, a number of ways of reducing the severity of combustion were investigated, including changes in engine settings or alteration of the composition of the fuel. Subsequent tests indicated that the ADE 236 diesel engine could operate satisfactorily on this fuel.

36446 (PB–89-167316/XAB) **Effect of a diesel blend containing heavy naphtha on the performance and durability of an ADE 236 diesel engine operating with standard-injection timing.** Falk, R.S. Council for Scientific and Industrial Research, Pretoria (South Africa). National Mechanical Engineering Research Inst. Jul 1987. 14p. Available from NTIS, PC EE04/MF E04.

The National Mechanical Engineering Research Institute (NMERI) carried out tests using blends of diesel with petrol and heavy naphtha, which indicated that the use of these fuels may be feasible. A durability test was then carried out on an ADE 236 diesel engine using a fuel blended to represent a 'worst case,' comprising 75% diesel and 25% hydro-treated straight run tops. The fuel was termed 'tops light diesel.' The test was terminated after 340 hours, which is equivalent to approximately 59,000 km, because of severe erosion of the pistons in the region of the combustion bowl. This erosion was caused by the poor combustion characteristics of the light diesel fuel.

36447 (PB–89-861348/XAB) **Ceramic engine parts. January 1972-April 1989 (Citations from the International Aerospace Abstracts data base). Report for January 1972-April 1989.** National Technical Information Service, Springfield, VA (USA). May 1989. 62p. Available from NTISPC N01/MF N01.

U.S. sales only.

This bibliography contains citations concerning manufacturing processes, testing, design, and stress analysis of ceramic engine components and coatings. Manufacturing processes discussed include slip casting, reaction sintering, hot isostatic pressing and plasma spraying. Engine parts to be used in automotive, military, land vehicle, and aircraft applications are included. (Contains 120 citations fully indexed and including a title list.)

36448 (DOE/NASA–4105-4) **NASA Lewis Stirling engine computer code evaluation.** Sullivan, T.J. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center; Sverdrup Technology, Inc., Cleveland, OH (USA). Jan 1989. 39p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AI01-85CE50112. (NASA-CR–182248). Order Number DE89014584/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In support of the US Department of Energy's Stirling Engine Highway Vehicle Systems program, the NASA Lewis Stirling engine performance code was evaluated by comparing code predictions without engine-specific calibration factors to GPU-3, P-40, and RE-1000 Stirling engine test data. The error in predicting power output was −11 percent for the P-40 and 12 percent for the RE-1000 at design conditions and 16 percent for the GPU-3 at near-design conditions (2000 rpm engine speed versus 3000 rpm at design). The efficiency and heat input predictions showed better agreement with engine test data than did the power predictions. Concerning all data points, the error in predicting the GPU-3 brake power was significantly larger than for the other engines and was mainly a result of inaccuracy in predicting the pressure phase angle. Analysis into this pressure phase angle prediction error suggested that improvement to the cylinder hysteresis loss model could have a significant effect on overall Stirling engine performance predictions. 13 refs., 26 figs., 3 tabs.

3307 Emission Control

36449 (UBA-FB–86-062) **Program to assure good in-use vehicle emissions performance in the Federal Republic of Germany through improved compliance with standards. Final report.** Walsh, M.P. Umweltbundesamt, Berlin (Germany, F.R.). Feb 1986. 73p. (In German). Available from Copy held by UB/TIB Hannover.

The in-use vehicle compliance program of the USA includes the following elements: 1. the certification with the requirement of 50.000 miles emission control function; 2. inspections/investigations of the manufacturers certification; 3. the import regulation; 4. the selective enforcement auditing to provide a high acceptable quality level; 5. the recall program, to deter manufacture of non conforming in-use vehicles; 6. the warranty program, intended to give warranty, when individual vehicles to not meet standards in-use; 7. the certification of 'aftermarket' parts to minimize anticompetitive effects; 8.

the inspection and maintenance program, consisting of emission tests of in-use vehicles; 9. the antitampering/misfueling program. In detail the experiences and methods of the inspection and maintenance program are exposed. The inspection and maintenance program has enabled a real air quality improvement. Following the good American experience a new compliance program is recommended to the German authorities, to assure good compliance with the weak European standards. (orig.) With 69 refs., 14 tabs., 6 figs.

36450 (PB–89-167290/XAB) **Performance and durability evaluation of a Moteurgaro engine fueled with ethanol.** Myburgh, I.S. Council for Scientific and Industrial Research, Pretoria (South Africa). National Mechanical Engineering Research Inst. Jul 1987. 13p. Available from NTIS, PC EE04/MF E04.

This paper presents the results of performance and durability tests of an ethanol-fueled Moteurgaro engine. Ethanol was specified as fuel as it was anticipated that the initial target for marketing the engine would be its use in agricultural tractors.

36451 (PB–89-167340/XAB) **NMERI (National Mechanical Engineering Research Institute) experience with alcohol fuels for diesel engines.** Hunt, M.S. Council for Scientific and Industrial Research, Pretoria (South Africa). National Mechanical Engineering Research Inst. 1987. 12p. Available from NTIS, PC EE04/MF E04.

This paper reviews research into the use of alcohols for extending or replacing existing diesel fuels. The experience has indicated that the replacement of diesel fuel by neat alcohol is a promising option for the long-term future development of alternative diesel engine fuels with both the modified fuel (as in Diesanol) and the modified engine likely to continue in the running. There do not appear to be any serious problems in the way of either of these options.

36454 (LA–11564-MS) **Challenges to the nonproliferation regime into the 21st Century: Conference summary.** Pilat, J.F. Los Alamos National Lab., NM (USA). May 1989. 14p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-8807171–Summs.: Challenges to the nonproliferation regime into the 21st century, Los Alamos, NM, USA, 20-21 Jul 1988). Order Number DE89013726/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

An overview is presented of a conference held at the Los Alamos National Laboratory, July 20-21, 1988, on "Challenges to the Nonproliferation Regime into the 21st Century." The conference was sponsored by the Laboratory's Center for National Security Studies in cooperation with the Center for Science and International Affairs of Harvard University and the International Assessments Section of Lawrence Livermore National Laboratory.

36455 (LLNL–9014513) **Vulnerability inducing technologies: An initial appreciation.** Reinhardt, G.C. Lawrence Livermore National Lab., CA (USA). 9 Jun 1989. 7p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE89014513/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The arms control community continues to act as though vulnerability were directly proportional to numbers of nuclear weapons, however rapidly they would voice their rejection of such a proposition if it were placed before them in an intellectual forum. Such neglect in matching action to knowledge is a well-known human phenomenon, but in this case it is particularly troublesome. START manages to reduce the numbers of weapons to just the right extent to encourage damage limiting. The present number of nuclear weapons on either side probably provides a robust deterrent; six thousand probably does not. To make matters worse, we live in a period of burgeoning technical expansion, so that even with the best intent on both sides, new technology threatens to cause new vulnerabilities in strategic systems. To pin a shorthand label on the problem, we will refer to vulnerability inducing technology as "VIT." In order to appreciate VIT, we will make a rough quantification of its consequences. This will at least provide some incentive for further study because the consequences are grave indeed. 2 tabs.

36456 (LA–11553-MS) **Offensive versus defensive tradeoffs in the European theater.** Kelleher, C.M. Los Alamos National Lab., NM (USA). Apr 1989. 13p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-36. Order Number DE89013729/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

CNSS papers No. 18.

Researchers with the Nuclear History Project are concerned with the development of nuclear force structures. The author is one of the researchers and in this paper discusses offensive versus defensive tradeoffs in the European theater. The paper was presented at a seminar in Los Alamos on July 27, 1987, sponsored by the Center for National Security Studies. The political and military relationships within NATO are seen to be in transition. The author analyzes this transition by reviewing past watersheds: the 1956–1958 discussions about stationing medium-range ballistic missiles in Europe; the 1972 Anti-Ballistic Missile (ABM) Treaty; the intermediate-range nuclear forces (INF) discussions of 1979–1987; and the president's 1983 Strategic Defense Initiative (SDI) speech. The author points out that it will make sense to reconsider the role of particular defense structures in bringing about both a politically acceptable and military credible balance in Europe.

Nuclear weapons are the ultimate weapons. Hence, many believe that in the realm of military research and development, research on nuclear weapons represents the ultimate. Those of us involved in nuclear weapon research are frequently asked why we do what we do, rather than get involved in the more "peaceful" endeavors open to scientists and engineers. There is a variety of answers to this question. 15 refs.

36461 (AD-A–204742/1/XAB) **Evolution of the chemistry of passive films of sputter-deposited, supersaturated Al alloys. Annual report, 1 July 1987-30 November 1988.** Davis, G.D.; Moshier, W.C.; Fritz, T.L.; Cote, G.O.; Long, G.G. Martin Marietta Labs., Baltimore, MD (USA). Jan 1989. 49p. (MML-TR–89-12C). Available from NTIS, PC A03/MF A01.

Aluminum and conventional aluminum alloys are readily susceptible to localized attack in chloride-containing environments. Recently, under funding from the Office of Naval Research, we have investigated the passivity and corrosion behavior of several supersaturated aluminum alloys formed by co-sputter deposition. This report shows that several of these alloys exhibit superior resistance to localized attack in electro-chemical polarization measurements and salt-fog tests. X-ray photoelectron spectroscopy was used to examine the surface chemistry of the passive film as a function of applied potential for Al,Al-Ta, and Al-Zr alloys. The passive film that forms on each alloy becomes enriched in oxidized solute as the specimen is anodically polarized. In general, the oxidized solute protects the substrate by restricting the ingress of chloride and oxygen and thereby preventing or reducing localized attack and film growth, respectively. Of the solutes examined to date, Ta is the most effective in this regard; the passive film on A1-Ta alloys remains thin and protective at the most noble potentials. Breakdown occurs only as the potential drop across the film becomes great enough to allow the transport of chlorides.

36462 (AD-A–204932/8/XAB) **Microstructural refinement of W-Ni-Fe heavy alloys by alloying additions.** German, R.M. Rensselaer Polytechnic Inst., Troy, NY (USA). Dec 1988. 7p. Available from NTIS, PC A02/MF A01.

Pub. in Metallurgical Transactions A, Vol. 19A, 3099-3104(Dec 1988).

This communication describes the effect of alloying additions on grain refinement in tungsten heavy alloys and the resulting changes in mechanical properties. The body-centered-cubic refractory metals, like molybdenum and tantalum, have total solubility in tungsten and a high solubility in the matrix. The solubility of the additive in tungsten provides a means to increase the strength by solid-solution hardening. Alternatively, the solubility of tungsten in the matrix is the key to grain growth and possible strengthening by a reduction in the grain-growth size.

36463 (AD-A–204962/5/XAB) **Corrosion of high-density sintered tungsten alloys. Part 1. Immersion testing.** Batten, J.J.; McDonald, I.G.; Moore, B.T.; Silva, V.M. Materials Research Labs., Ascot Vale (Australia). Oct 1988. 45p. (MRL-R–1139). Available from NTIS, PC A03/MF A01.

See also Part 2, AD-A204 964. Original contains color plates: All DTIC and NTIS reproductions will be in black and white.

Sintered tungsten alloys are candidate materials for certain Australian ammunition components, namely kinetic energy penetrators, because of their high density. It is probable that a storage life of twenty years in an uncontrolled environment will be a requirement for this ammunition. Thus there is a need to determine the long-term storage capability of these alloys, in particular their capability to remain un-corroded during this period. The corrosion behavior of four candidate alloys was therefore, evaluated through weight loss measurements after total immersion in both distilled water and 5% sodium chloride solutions. The propensity of these alloys to corrode in a crevice situation was assessed in the sodium chloride solution. Some insight into the mechanism of corrosion was afforded by an examination of the surfaces after the tests using the SEM and through an analysis of the corrosion products. Pure tungsten and all the alloys studied underwent corrosion during the tests, and in each case the rate of corrosion in sodium chloride solution was markedly less than that in distilled water. Examination of the data shows that for each of the tests, copper as an alloying element accelerates corrosion of tungsten alloys.

36464 (AD-A–204964/1/XAB) **Corrosion of high-density sintered tungsten alloys. Part 2. Accelerated corrosion testing.** Batten, J.J.; Moore, B.T. Materials Research Labs., Ascot Vale (Australia). Dec 1988. 31p. (MRL-R–1145). Available from NTIS, PC A03/MF A01.

See also Part 1, AD-A204 962. Original contains color plates: All DTIC and NTIS reproductions will be in black and white.

As a consequence of corrosion during long-term storage in uncontrolled environments, where high humidity may be combined with cyclic temperature changes, some high-density sintered tungsten penetrators have been found to be unreliable. A storage life of twenty years without special storage conditions is a requirement for this ammunition, and therefore there is a need to determine the long-term storage capability of selected alloys. The corrosion behavior of four candidate alloys was evaluated and compared with that of pure tungsten. Rates of corrosion during the Cyclic Humidity Test and the Salt Mist Test were ascertained from weight-loss measurements. Insight into the corrosion mechanism was gained from the nature of the corrosion products and an examination of the corroded surfaces. The data showed that copper as an alloying element accelerates corrosion of tungsten alloys. Both attack on the tungsten particles and the binder phase were observed together with tungsten grain loss.

36465 (AD-A–205234/8/XAB) **Effect of noble gases on the properties of ion-beam-sputtered niobium films.** Lichtenwalner, D.J.; Anderson, A.C.; Rudman, D.A. Massachusetts Inst. of Tech., Lexington, MA (USA). Lincoln Lab. Feb 1989. 4p. (JA–6147). Available from NTIS, PC A02/MF A01.

Pub. in Jnl. Vacuum Science and Technology, Vol. A7, No. 1, 102-104(Jan/Feb 1989).

All of the results presented here support the authors hypothesis that the reflection of the primary beam during sputtering plays a significant role in determining final film properties, especially in the case of ion-beam sputtering. The film properties are affected both by noble-gas incorporation in and noble-gas bombardment of the growing film. It is not as evident for sputtering in a planar arrangement for three main reasons: (i) the reflection coefficient is minimized by sputtering at normal incidence, (ii) the higher gas pressures used can scatter the reflected particles, and (iii) the target potential keeps any ionized reflected particles from escaping the dark space region, accelerating them back to the target.

36466 (AGA–9013003) **Crack growth behavior and modeling: Topical report.** Christman, T.K.; Brust, F.W. American Gas Association, Inc., New York, NY (USA); Battelle Columbus Div., OH (USA). c Mar 1989. 74p. Available from American Gas Association, 1515 Wilson Blvd., Arlington, VA 22209.

This report contains data on the investigation into the crack growth of stress-corrosion cracks. The specific subtasks examined were stress-corrosion-crack shapes, identification of a crack driving force parameter, and the relationship between crack shape and mechanical properties. Crack shape data (length and depth) was obtained from five operating pipelines. The individual cracks were found to have length-to-depth ratios ranging from 4 to 8. Longer aspects ratios up to 15 resulted when crack coalescence occurred. The deepest multiple cracks were generally no deeper than the deepest individual cracks indicating that crack coalescence does not greatly affect radial growth. The crack driving force parameter examined stress intensity, K, J-integral, crack tip opening angle (CTOD), plastic zone size for comparison with the SCC growth characteristics. To conduct the analysis, a three-dimensional finite-element model of the stress-strain field around a part-through surface flaw in line pipe was developed. 10 refs., 22 figs., 7 tabs.

36467 (AOSTRA–8808, pp. 17) **Aspects of alloy selection in thermal recovery of heavy crudes and tar sands.** Schillmoller, C.M. (Nickel Development Inst., Schillmoller Associates, Huston, TX, USA). Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

Enhanced oil recovery by thermal methods such as steam injection and in-situ combustion can be very effective in substantially improving the yield from existing fields, and in particular when dealing with heavy oils and tar sands. Corrosion in such systems by wet carbon dioxide, hydrogen sulfide and various organic acids can be very severe, especially in presence of producing brines and oxygen in elevated temperature producing zones. The paper reviews some of the experiences with steam flooding and in-situ combustion in California and Alberta. Problems with high uniform corrosion rates, pitting and crevice corrosion, and stress corrosion cracking are described and charts provided that define under which conditions stainless steels can be expected to perform well, and when higher alloyed Cr-Ni-Mo and Ni-Cr-Mo materials will be required for tubulars and surface equipment. In commercial scale projects, corrosion-resistant alloys can be readily justified on the basis of reliability, no need for corrosion inhibitors and coatings, and the flexibility they provide in meeting a wide range of corrosive conditions with the possibility of modifying the thermal recovery process if so desired. 16 refs., 15 figs.

36468 (AOSTRA–8808, pp. 63) **Corrosion problems and experience at AOSTRA in-situ thermal recovery pilots.** Gray, L.G.S. (Alberta Research Council, Edmonton, AB, Canada); McCormack,M.E. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, Edmonton, Canada, 7-12 Aug 1988;CE–02593). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $150.00 CAN.

The corrosion problems and experience are reviewed for in- situ heavy oil recovery pilot projects funded by the Alberta Oil Sands Technology and Research Authority. The focus is on the performance of well casing and tubing, as failure of downhole equipment can impact strongly on commercial project economics. In steam stimulation and steam drive processes, carbon steel tubing and casing have generally given good performance, based on 5 to 8 years of operating experience. When corrosion has been observed, it has consisted of general corrosion and pitting in the well annulus and pitting on the exterior of the well casing, neither of which was deemed a threat to long term pilot operation. Specialty alloys used in thermocouples and pressure measurement tubing frequently experienced chloride-induced pitting or stress corrosion cracking. In combustion pilots, severe corrosion has occurred in some injection and production wells. Corrosion in injection wells consisted of severe pitting and scaling from alternating injection of high pressure air and recycled water. Severe corrosion in the production wells occurred in the annulus from wet produced gas or inside the well tubing from produced emulsion. Partial or complete replacement of tubing strings has been required in some injection and production wells. Inhibitors, coatings, specialty alloys, and steam/water injection have been investigated as methods to control corrosion in combustion pilot wells. The corrosivity of the produced gas and emulsion in combustion projects appears to be associated in a complex manner to CO_2, O_2, pH, temperature, the nature of the oil, water cuts, and fluid flow rates. 32 refs., 7 figs., 2 tabs.

36469 (CANMET–MTL86-78) **Corrosion inhibition in sour media.** Sastri, V.S. Canada Centre for Mineral and Energy Technology, Ottawa, ON (Canada). 1988. 53p. (MICROLOG–89-01953). Available from Canada Centre for Mineral and Energy Technology, Technical Information Division, 555 Booth St., Rm. 342, Ottawa, ON, Canada K1A 0G1; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Corrosion inhibition mechanisms, hydrophobicity and the effect of structure of inhibitors in corrosion inhibition in sour media are presented. Application of Hammett's equation, surface analysis and quantum chemical calculations in rationalizing the behaviour of inhibitors has been discussed. Methods used for quality control of oil field corrosion inhibitors have been discussed. The application of a hard and soft acid and base principle in the classification of corrosion inhibitors has been advanced. 142 refs., 1 fig., 19 tabs.

36470 (CHOA–8808, pp. 11) **The development of Mod N-80HO casing for cyclical steam stimulation.** Mills, A.W. (Algoma Steel Co., Ltd., Canada); Smyth, D.; Green, D.J. Canadian Heavy Oil Association (Canada). 1988. (CONF-8808237–: Thermal well completions seminar, Edmonton, Canada, 11 Aug 1988;CE–02660). In *Thermal well completions seminar.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $N/C.

This paper discusses the development of Mod N-80HO steel casing at Algoma Steel Company for cyclical steam simulation. Design criteria for these casings include high temperature performance, connection integrity, resistance to cyclical compressive/tensile loading and resistance to corrosion under H_2S. The properties of the steel itself are discussed: chemical composition, tempered martensitic structure, mechanical properties, and corrosion resistance. Two types of oversized couplings are being produced at Algoma for this casing. 13 refs., 9 figs., 6 tabs.

36471 (CHOA–8808, pp. 36) **Production of ERW L80 for enhanced recovery wells.** Dorricott, J. (IPSCO, Inc., Canada). Canadian Heavy Oil Association (Canada). 1988. (CONF-8808237–: Thermal well completions seminar, Edmonton, Canada, 11 Aug 1988;CE–02660). In *Thermal well completions seminar.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, Canada T5J 3L8; $N/C.

In enhanced recovery oil well casings, the normal expectations of strength and thoughness of the wellcasings are coupled with the need to survive cyclic thermal stressing during steam injection and recovery, which demands from the product a high degree of uniformity and integrity. IPSCO pursued a program in order to develop a group of products with optimum microstructural uniformity, high metallurgical cleanness, and high dimensional accuracy and surface

quality. Eelectroresistance welded (ERW) products and seamless product were compared and ERW performance was evaluated in simulated service conditions. This paper deals with the manufacturing of ERW L80 for British Petroleum: its chemical composition and quality control; the effects of welding and heat: treatment, a comparison of ERW versus seamless casings; and testing for heavy oil service. 22 figs., 4 tabs.

36472 (CONF-890468–11) **Cross-sectional TEM [transmission electron microscopy] studies of Cr films deposited by ion-assisted deposition and physical vapor deposition.** Cheng, C.C.; Erck, R.A.; Fenske, G.R. Argonne National Lab., IL (USA). 1989. 19p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract W-31109-ENG-38. From 16. international conference on metallurgical coatings and equipment exhibit; San Diego, California, USA; 17-21 Apr 1989. Order Number DE89014643/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A series of Cr films were deposited by physical vapor deposition and ion-assisted deposition as a function of the incident ion energy and the ion/atom arrival-rate ratio, R. Cross section transmission electron microscopy was used to study the microstructure of the substrate/film interface and film surface regions of these Cr films. High-energy ion bombardment (>300 eV) was found to enhance the adhesion of the deposited film owing to the formation of an intermixing layer at the interface region. Hardness data suggest that high ion energy and low ion/atom arrival-rate ratios produce films with relatively high hardness because few pores and many defects are present. 10 refs., 5 figs., 1 tab.

36473 (CONF-890541–1) **Structural ceramics in the advanced materials world.** Craig, D.F. Oak Ridge National Lab., TN (USA). 1989. 12p. Sponsored by DOE Energy Research. DOE Contract AC05-84OR21400. From Evolution of advanced materials; Milan, Italy; 31 May - 2 jun 1989. Order Number DE89013046/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In the last sixty years, significant changes have occurred which have made ceramics attractive for a variety of complex and sophisticated applications. As higher values of strength and fracture toughness have been achieved, these advanced ceramics are being used or considered in high-temperature, load-bearing applications. The status of these ceramics is reviewed, with emphasis on methods to increase toughness. 8 figs., 1 tab.

36474 (CONF-890721–22) **Relaxation response of A533B steel from 25 to 600°C.** Swindeman, R.W.; Bolling, E. Oak Ridge National Lab., TN (USA). 1989. 8p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC05-84OR21400. From Joint ASME/JSME pressure vessel and piping conference; Honolulu, Hawaii, USA; 23-27 Jul 1989. Order Number DE89010179/JAW. Available from NTIS, PC A02/MF A01 - OSTI.

Relaxation tests were performed on A533B steel over the range 25 to 600°C in order to examine the general features of time-dependent deformation. It was found that the relaxation strength increased with the flow stress at low temperatures and was relatively independent of history at high temperatures. In the temperature range 400 to 600°C the inelastic strain rates calculated from the relaxation rates followed stress dependencies that were consistent with expectations based on a model proposed by Hart and coworkers for matrix deformation. 21 refs., 10 figs.

36475 (CONF-890721–24) **Estimating fracture toughness using tension or ball indentation tests and a modified critical strain model.** Haggag, F.M.; Nanstad, R.K. Oak Ridge National Lab., TN (USA). 1989. 7p. Sponsored by DOE/NE;NRC. DOE Contract AC05-84OR21400. From Joint ASME/JSME pressure vessel and piping conference; Honolulu, Hawaii, USA; 23-27 Jul 1989. Order Number DE89010324/JAW. Available from NTIS, PC A02/MF A01 - OSTI.

A simple technique is described for estimating the fracture toughness by coupling the measured flow properties (either from a uniaxial tensile test or from a new automated ball indentation test) with a modified but empirically correlated critical fracture strain model. This technique is currently limited to ductile fracture applications. The modified model was used in combination with either tensile or ball indentation data to estimate fracture toughness of A515 grade 70 carbon steel and A533 grade B class 1 pressure vessel steel, respectively. The difference between fracture toughness predictions and measured values, using a computerized single-specimen unloading compliance technique in accordance with ASTM E-813, was less than 11%. 8 refs., 5 figs., 2 tabs.

36476 (CONF-8810377–1) **Grain boundaries in silicon from zero temperature through melting.** Phillpot, S.R.; Wolf, D. Argonne National Lab., IL (USA). Dec 1988. 16p. Sponsored by DOD;DOE/ER. DOE Contract W-31109-ENG-38. From Symposium on interface structure and reactions; San Francisco, California, USA; 23-26 Oct 1988. Order Number DE89013186/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Recent atomistic simulations of silicon grain boundaries are reviewed and compared with similar studies in metals. Three aspects are discussed in detail: (i) the zero-temperature structure-energy correlation, (ii) the elastic anomalies near a grain boundary at zero temperature, and (iii) the high-temperature stability of a twist boundary and its role in thermodynamic melting. In each case striking similarities with studies on metals are found. 39 refs., 8 figs.

36477 (CONF-8903140–1) **The topological structure of grain boundaries.** Rivier, N. Argonne National Lab., IL (USA). Jun 1989. 12p. Sponsored by DOE Energy Research. DOE Contract W-31109-ENG-38. From Les Houches international workshop on number theory and physics; Les Houches, France; 7-16 Mar 1989. Order Number DE89014676/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

It is shown that grain boundaries are quasiperiodic tillings made of inflatable sequences of structural units. A general grain boundary is a quasiperiodic grid of dislocations with the same inflation multiplier (a quadratic irrational) in every direction. 12 refs., 7 figs.

36478 (CONF-8905168–1) **Ion-assisted deposition of silver films on ceramics for friction and wear control.** Erdemir, A.; Fenske, G.R.; Erck, R.A.; Cheng, C.C. Argonne National Lab., IL (USA). 1989. 36p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract W-31109-ENG-38. From 44. annual STLE meeting; Atlanta, Georgia, USA; 1-4 May 1989. Order Number DE89014635/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Development and implementation of novel surface modification methods for controlling friction and wear of ceramic surfaces are of crucial importance to the success of ceramic tribosystems. Frictional heat, tribochemical interactions, and microfracture during sliding contact give rise to severe wear damage and frictional instabilities in tribosystems consisting of ceramic materials. This study introduces a new approach to surface modification involving ion-assisted deposition (IAD) of silver films on alumina and sapphire ceramics to achieve improved adhesion, friction, and wear behavior. The results of pin-on-disc experiments showed that silver films produced by IAD were very adherent and the wear rates of ceramic substrates coated with IAD silver were negligible. The friction coefficients of ceramic substrates were also substantially reduced by these silver films. Without ion assistance, silver films severely delaminated from the wear tracks of ceramic substrates and the wear rates and friction coefficients were relatively high. 23 refs., 7 figs., 1 tab.

36479 (CONF-8906135–1) **The Sigmajig: An improved hot-cracking test.** Goodwin, G.M. Oak Ridge National Lab., TN (USA). 1989. 4p. Sponsored by DOE Defense Programs. DOE Contract AC05-84OR21400. From International congress on technology and technology exchange; New York, NY, USA; 28 Jun 1989. Order Number DE89013029/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This report covers the newly developed Sigmajig test system. This system when combined with a gas tungsten arc provides a method to test weldability for the evaluation of hot cracking sensitivity. Initial use has been with thin sheet (0.2-1.5mm) although there is no inherent thickness limitation. 5 refs., 5 figs., 1 tab. (JDF)

36480 (DOE/ER/45085–T1) **Application of quaternary phase diagrams to compound semiconductor processing: Progress report, April 1–December 31, 1988.** Schwartzman, A. Stanford Univ., CA (USA). 1989. 20p. Sponsored by DOE Energy Research. DOE Contract FG03-84ER45085. Order Number DE89014537/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report has summarized the work done on phase equilibria in II-VI quaternary systems over the last year. In general, the phase diagram depicts the geometric relationship among thermodynamic variables for phases in equilibrium with each other under an established set of conditions. Each type of thermodynamic system has a particular set of intensive variables which, when plotted against each other, best elucidate the equilibrium conditions. Isobaric, isothermal phase diagrams are used to predict solid state reactions in ternary and quaternary systems. This research has illustrated that a rigorous and methodical technique using the computer to construct quaternary phase diagrams can be successfully applied to a wide range of II-VI semiconductor systems, even for systems with solid solubility. 19 refs., 12 figs., 2 tabs.

36481 (DOE/ER/45147–4) **High resolution electron energy loss studies of surface vibrations: Progress report, July 1, 1988–June 20, 1989.** Kesmodel, L.L. Indiana Univ., Bloomington, IN (USA). Jun 1989. 7p. Sponsored by DOE Energy Research. DOE Contract FG02-84ER45147. Order Number DE89013964/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

New experimental investigations of surface vibrational properties of materials with high-resolution electron energy loss spectroscopy (EELS) are reported. The effort has focused on surface phonon dispersion measurements for copper (111) and ultrathin epitaxial films of nickel and cobalt grown on a copper (001) substrate. Data and analysis of several surface modes and resonances on Cu (111) is consistent with a modest (15%) softening of the intraplanar force constant between surface atoms. For epitaxial thin films of a few monolayers thickness of nickel on Cu (001), new film modes are identified experimentally and correspond to vibrational motion localized primarily in the film. Measurements for epitaxial films of cobalt on a Cu (001) substrate exhibit substantial flattening of the Rayleigh phonon dispersion, suggestive of surface stress in the films.

36482 (DOE/ER/45186–T1) **Structural and surface characterization of dispersed metal catalysts: Final report, September 1, 1986–December 31, 1988.** Reucroft, P.J.; De Angelis, R.J.; Bentley, J. Kentucky Univ., Lexington, KY (USA). Dept. of Materials Science and Engineering. 1988. 13p. Sponsored by DOE Energy Research. DOE Contract FG05-85ER45186. Order Number DE89014530/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The studies that have been conducted in the last two year period have extended the research activities that were initiated in 1984. Dispersed metal catalyst systems and supports investigated in the most recent phase of the project include: Ni/Co/SiO_2, Co/SiO_2, Ni/SiO_2 and ZrO_2. A model catalyst system comprising Pt layers/particles on porous and non-porous silica has also been investigated and a study has been initiated on Co, Ni and Co/Ni layers on SiO_2. Structural and Surface Characterization techniques that have been employed include: transmission electron microscopy (TEM), scanning electron microscopy (SEM), analytical electron microscopy (AEM), x-ray diffraction (XRD) and ion scattering spectroscopy (ISS). In addition, catalyst activity has been evaluated by measuring the kinetics of hydrocarbon formation from CO/H_2 mixtures. 15 refs.

36483 (DOE/ER/45262–T1) **Fundamental magnetic studies of iron-rare-earth-metalloid alloys: Technical performance report.** Sellmyer, D.J.; Hadjipanayis, G.C. Nebraska Univ., Lincoln, NE (USA); Kansas State Univ., Manhattan, KS (USA). 6 Dec 1988. 11p. Sponsored by DOE Energy Research. DOE Contract FG02-86ER45262. Order Number DE89013803/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This research is focussed on the synthesis of new iron-rare-earth magnetic phases which may have significant technological properties. An important aim is to investigate new methods for producing these materials such as melt spinning and sputtering plus specific heat treatments. Studies are made of the relationship between microstructure and properties such as coercivity, spontaneous magnetization, and anisotropy (magnitude and direction) in bulk and thin film samples. Our goal is to understand these relatively complex materials on the basis of fundamental electronic structure, theory is of itinerant magnetism and localized 4f electronic states, and the microstructural effects which control the extrinsic properties. To achieve this a broad range of experiments and calculations are performed.

36484 Atomic level observation of grain boundaries in metals. Smith, D.A. (IBM Corp., Yorktown Heights, NY (USA)). pp. 8 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

High resolution microscopy has given an explicit, atomistic insight into the nature of the core structure of grain boundaries in metals. Specific issues which have been addressed and to some extent resolved are the occurrence of multiple structures, the transition from low angle to high angle character, the structural unit concept, the relation between the primary and secondary dislocations in a boundary, the spatial extent of the boundary core and the width of the cores of grain boundary dislocations. Much but not all that has been observed by high resolution microscopy was predicted by atomistic computer modelling.

36485 X-ray diffraction studies of the structure and properties of grain boundaries. Fitzsimmons, M.R. (Cornell Univ., Ithaca, NY (USA)); Sass, S.L. pp. 16 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Quantitative X-ray diffraction techniques have been used to study the atomic structure and thermal properties of large angle [001] twist boundaries in Au. The reciprocal lattice of the $\Sigma = 5$ boundary was mapped out using synchrotron radiation. The atomic structure of this boundary was obtained by finding the best fit to the intensity observations using a chi square analysis. The boundary structure was shown to consist of arrays of two kinds of distorted octahedra and special configurations of distorted tetrahedra interwoven together by the boundary symmetry. The Debye-Waller factor of the grain boundary (and the magnitude of the atomic displacements due to thermal motion) in the plane of the interface was determined from integrated intensity measurements as a function of temperature.

36486 Atomic structure of tilt boundaries in Mo bicrystals. Penisson, J.M. (Centre d'Etudes Nucleaires, Grenoble (France)). pp. 12 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Several tilt boundaries in Mo bicrystals have been observed by high resolution electron microscopy. The use of higher accelerating voltage leads to an increase of the resolving power. In these conditions the atomic structure can be precisely determined and compared to theoretical models. In a low angle boundary the core structure is in agreement with an empty core model. In a high angle boundary the structure is facetted and some structural units can be identified if the boundary is not too far from the symmetric position. A completely asymmetric boundary does not exhibit these structural units.

36487 Ab-initio calculation of the microscopic properties of a grain boundary in germanium. Payne, M.C. (Massachusetts Institute of Technology, Cambridge (USA)); Bristowe, P.D.; Joannopoulos, J.D. pp. 7 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

An application of the molecular dynamics simulated annealing method for performing total energy calculations is made to the study of the microscopic structure of a high-angle grain boundary in germanium. In particular, two low energy Σ=5 (001) twist boundary structures are identified and their detailed bonding geometry is analyzed by determining the local distribution of valence electron charge density. The structures are shown to exhibit two intrinsic defects: four-membered rings and three-fold coordinated atoms.

36488 Simulation study of interfaces in Ni, Al and Ni_3Al with and without boron. Chen, S.P. (Los Alamos National Lab., NM (USA)); Voter, A.F.; Srolovitz, D.J. pp. 8 of Interface science and

engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Atomistic simulations of free surfaces and [001] symmetric tilt grain boundaries in pure Ni and Al and the intermetallic, Ni_3Al, are presented. In the vicinity of the grain boundary, the authors show the existence of a rapidly decaying oscillatory strain which is similar to that observed at free surfaces. The total expansion or excess volume associated with the grain boundary is shown to be proportional to the grain boundary energy. The atomistic structures of the simulated grain boundaries have been analyzed in terms of the structural unit model, which is found to be of limited utility in the case of the intermetallic. Preliminary results show that boron segregates more strongly to grain boundaries than to free surfaces. Boron segregation strengthens the grain boundary but has little effect on grain boundary structure other than a small local expansion.

36489 Structure of Ni/MgO interfaces. Hoel, R.H. (Max-Planck-Institute fuer Metallforschung, Stuttgart (West Germany)); Ruehle, M. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Polycrystalline Ni has been solid state welded onto the (001) surface of MgO in vacuum, and the phase-boundary viewed face-on as well as edge-on in the transmission electron microscope. The extent of interdiffusion has been determined by energy dispersive X-ray microanalysis, and conventional TEM has been used to study the possible formation of new phases, the possible presence of misfit dislocations and the orientation relationship between the Ni and the MgO. The theoretical misfit dislocation structures were also calculated using the O-lattice theory.

36490 Grain boundary structure in HCP metals. King, A.H. (State Univ. of New York, Stony Brook (USA)); Chen, F.R. pp. 7 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

A transmission electron microscope study of the structures of grain boundaries in zinc has been performed. Dislocation structures are observed in many high angle boundaries, and in most cases, the boundaries that exhibit such structure are close in misorientation to a coincidence site lattice (CSL) forming misorientation. In some cases, the CSL can be formed exactly, by a simple rotation, as in the familiar cubic crystal cases, but this can only occur for rotations about the [0001] axis. For all other cases there must also be a slight constraint of the c/a ratio to some ideal value. Grain boundary structures are found to be related to constrained CSLs just as they are for exact CSLs in the more familiar cases. A serious complication for the analysis, however, is that the distribution of CSLs in misorientation space is very inhomogeneous for the HCP materials, so there are many candidate CSL systems for the analysis of any experimentally observed boundary.

36491 Star-disclination in a ferro-elastic material B19 MgCd alloy. Kitano, Y. (Hiroshima Univ. (Japan)); Kifune, K.; Komura, Y. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Disclinations in thin crystals of MgCd alloy are demonstrated by high resolution electron microscopy. The disclinations appear along the intersection lines of twin boundaries which occur due to spontaneous lattice deformations at the phase transition temperature. A star-disclination which is not an intersection line comes out to compensate the strain field of the disclinations. A single disclination is seldom observed but dipoles, tripoles, quandrupoles and multipoles of disclinations are found in stable crystals.

36492 Grain boundary structure in Ni_3Al. MacKenzie, R.A.D. (Cornell Univ., Ithaca, NY (USA)); Vaudin, M.D.; Sass, S.L. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). DOE Contract FG02-85ER45211. (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The influence of boron segregation and non-stoichiometry on grain boundary structure in Ni_3Al was studied by transmission and scanning electron microscopy techniques. Small angle twist and tilt boundaries were produced by hot pressing misoriented single crystals of both doped and undoped material. Dislocation structures were observed in both bicrystal and polycrystal grain boundaries. In most cases the grain boundary dislocations were found to have the expected a (100) Burgers vector, however in one case dislocations with Burgers vector a/2 (110) have been observed. Using a SEM diffraction technique the frequency of occurrence of grain boundary types was examined and found to be unchanged by the addition of boron.

36493 Structure of asymmetrical tilt boundaries formed during creep of (112) oriented aluminum single crystals. Mills, M.J. (Ecole Polytechnique Federale de Lausanne (Switzerland)); Stadelmann, P. pp. 8 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The structure of (110) tilt boundaries formed during creep at 400°C of (112) oriented aluminum single crystals has been studied using high resolution and weak beam electron microscopy. The dislocation content is described as a function of the plane of the boundaries and the tilt misorientation. The arrangement of the atomic columns indicates that higher angle boundaries are composed predominantly of Lomer dislocations aligned in orderly, low energy tilt configurations. The boundary plane is faceted by the presence of 60° dislocations. In contrast, lower angle boundaries tend to be less periodic and have a higher density of 60° than Lomer dislocations. The Burgers vectors of the 60° dislocations have been determined using weak beam observations and the magnitude of the twist misorientation of the boundaries agrees well with the dislocations present. The relevance of these observations with respect to glide on non-compact planes, subgrain boundary formation during creep and dislocation core observations in aluminum is also discussed.

36494 High resolution electron microscopy studies of the atomic structure of interfaces in magnetic sandwiches. Faure, J.P. (Universite de Toulon, La Garde (France)); Cesari, C.; Renard, D.; Ferrari, C.; Nihoul, G. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The authors report some studies performed on ultra-thin cobalt layers protected from oxidation by two gold films. The interfaces Au/Co of these magnetic sandwiches are studied at an atomic scale by high resolution electron microscopy. A systematic study of the micrographs by optical diffraction on a laser bench gives interesting information on the adjustment between gold and cobalt planes. this kind of result will be linked, later on, to the magnetic properties of the bidimensional layer.

36495 Interfaces in composites reinforced with rapidly solidified metallic ribbons. Ruutopold, A. (Univ. of Waterloo, Ontario (Canada)); Varin, R.A.; Wronski, Z. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Rapidly solidified continuous metallic ribbons of $Fe_{40}Ni_{40}B_{20}$ alloy have been incorporated into the polypropylene matrix. The quality of interfacial bonding has been investigated by the pull-out tests and scanning electron microscopy of the ribbon surfaces. Rapidly solidified discontinuous ribbons of $Ni_{75}Al_{23}B_1Zr_1$ alloy have been cast in the aluminum matrix. SEM combined with KEVEX analysis has been employed to study the interfacial zone formed around the ribbons.

36496 Grain-boundary dislocations structure and movement in Σ=9 studied by HREM. Thibault-Desseaux, J. (Centre d'Etudes Nucleaires, Grenoble (France)); Elkajbaji, M. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The evolution of grain-boundary structure after deformation has been studied by HREM. The decomposition of the running-in dislocations into DSC perfect dislocations has been shown. The structure of the residual dislocations was determined and their movement established at atomic scale. Glide and climb motion are involved. Conservative climb is demonstrated and the GB migration examined.

36497 TEM determination of incoherent twin-boundary structure in $L1_2$ ordered alloys. Tichelaar, F.D. (Delft Univ. of Technology (Netherlands)); Schapink, F.W. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The structure of incoherent Σ=3 twin boundaries in the $L1_2$ ordered alloy Cu_3Au is investigated employing TEM. The boundary planes are found to vary about ten degrees from a (112) plane. Employing the TEM method of α-fringes common diffraction vectors are used for determining the rigid-body translation between the two crystals at the boundary. No dilatation has been found at a (754) incoherent twin boundary within experimental error. Four grain boundary areas having different translations that preserve the density in the boundary are demonstrated, separated from each other by an antiphase boundary on one side of the boundary plane.

36498 Search for experimentally observed grain boundary phase transitions. Balluffi, R.W. (Massachusetts Institute of Technology, Cambridge (USA)); Hsieh, T.E. pp. 14 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). DOE Contract FG02-84ER45116. (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The phase space for a heterogeneous system containing a grain boundary involves a relatively large number of variables (i.e., at least six plus the number of components), and it is therefore conceptually possible to induce a large variety of grain boundary phase transitions by selectively varying these parameters. Despite this, a review of the literature reveals that there have been virtually no clear-cut experimental observations of transitions reported in which the boundary structure has been observed as a function of time under well defined conditions. In current work, the authors are searching for roughening/faceting transitions and melting transitions for boundaries in Al by hot stage transmission electron microscopy. A clear example of a reversible roughening/faceting transition has been found. No evidence for melting has been found for temperatures as high as 0.96 T_m (by monitoring GBD core delocalization in several special boundaries with Σ {<=} 13) or 0.999 T_m (by observing the local diffraction contrast at general boundaries in polycrystalline specimens).

36499 Free energy calculation via MD: methodology and application to bicrystals. Lutsko, J.F. (Argonne National Lab., IL (USA)); Wolf, D.; Yip, S. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). DOE Contract W-31-109-ENG-38. (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Three independent methods for the calculation of free energies via molecular dynamics are used to determine the free energies of crystalline solids. The relative accuracy and computational efficiency of the methods is compared and discussed. The free energies of two Cu bicrystals are then computed and compared over a wide range of temperatures and their relative stabilities are discussed.

36500 Phase equilibria and interfacial phenomena in the Mg-Al-O system at 800°C. Weirauch, D.A. Jr. (Aluminum Co. of America, Alcoa Center, PA (USA)). pp. 10 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The wetting of ceramic surfaces by aluminum alloys has been studied using Al-Mg-O as a model system. This chemical system was chosen since it is technologically important and high-purity, well-characterized materials are readily available. Magnesium alloyed with the aluminum sessile drop and silicon picked up from the experimental apparatus cause an initial reduction in contact angle by altering the protective nature of the oxide film formed on the sessile drop. Evidence of spreading is observed as an intermediate process in the reactive sessile drop pairs. Reactions between the Al-Mg alloys and sapphire (Al_2O_3), spinel ($MgAL_2O_4$), and periclase (MgO) are interpreted with predicted phase stability and the change in magnesium activity of the alloy due to volatilization. Only the rate of the periclase-alloy interaction was rapid enough to result in a continuous product layer after 24 hours. Contact angles and surface energies reflecting a true Al-Al_2O_3 interface are reported.

36501 Hydrogen segregation and diffusion at grain boundaries. Birnbaum, H.K. (Univ. of Illinois, Urbana (USA)); Ladna, B.; Kimura, A. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The segregation of hydrogen at grain boundaries in Ni has been shown to be dependent on the nature of the boundary using SIMS techniques. This contrasts to hydrogen segregation at free surfaces which appears to be less sensitive to the crystallography of the surface. The increased H concentration due to segregation occurs over appreciable distances from the surface or grain boundaries. The diffusivity of H along grain boundaries has been determined using SIMS techniques and correlated with studies of fracture kinetics.

36502 Oxygen segregation in 32°[001] molybdenum tilt grain boundary. I. Segregation sites determination. Nowicki, T.N. (Ecole Nationale Superieure des Mines, Saint-Etienne (France)); Penisson, J.M.; Biscondi, M. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The segregation sites for oxygen in molybdenum 32°[001] tilt grain boundary are determined on the basis of static grain boundary simulations and pure grain boundary high resolution electron microscope observations. Interatomic solute-solvent potentials corresponding to different solute atom radii and reproducing the enthalpy of mixing of oxygen in molybdenum (2.6 eV) are used.

36503 Oxygen segregation in 32°[001] molybdenum tilt grain boundary. II. Enthalpies of segregation determination from AES and grain boundary grooves measurements. Nowicki, T.N. (Ecole Nationale Superieure des Mines, Saint-Etienne (France)); Biscondi, M. pp. 8 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Measurements of oxygen concentration in a molybdenum 32°[001] tilt grain boundary versus quench temperature and measurements of grain boundary interfacial tension versus grain boundary concentrations are presented. A grain boundary segregation thermodynamic description involving different segregation sites is proposed. The relation between grain boundary tension and energy is discussed. Grain boundary oxygen segregation enthalpies in the different sites are found to be about −2.4 eV per atom.

36504 Experimental evidence of sulfur effect on the plane and on the extrinsic dislocations of a Σ = 3 grain boundary in nickel. Bouchet, D. (Universite Paris-Sud, Orsay (France)); Aufray, B.; Priester, L. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international

conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The evolutions of the misorientation, of the grain boundary plane and of the extrinsic dislocations (EGBD's) characteristics of the same $\Sigma = 3$ grain boundary in nickel are analyzed in function of the level of sulfur segregation in this boundary. The variation of the sulfur content is obtained by sulfidation and desulfidation of the same nickel thin foil.

36505 New ideas on interface structure from significant disagreements between experiments and prediction of interface composition in Ag base alloys. Cabane, F. (Faculte des Sciences et Techniques, Marseille (France)); Cabane, J. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Experimental results on surface and grain boundary segregation in Ag(Sn), Ag(Pb), Ag(Ni) and Ag(S) solid solutions are compared with the usual predictions of segregation. Structural aspects of interfaces are deduced by referring to the phase limiting the solubility in these binary systems.

36506 Interfacial structure modifications induced by sulfur in Ag-Ni alloys. Charai, A. (Faculte des Sciences et Techniques, Marseille (France)); Roux, D.; Rolland, A.; Saindrenan, G.; Aufray, B. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

In this paper the authors present the first results concerning the effect of an impurity of low solubility on the interfacial structure of simple model system: the Ag/Ni system with sulfur as the impurity common to the two metals. The Ag/Ni interfaces are produced by vapor deposition and epitaxial growth on single crystal substrate of NaCl cleaved. T.E.M. observations of these interfaces show that nickel is in good epitaxy on silver while misfit dislocations network is not visible. After annealing in pure hydrogen, epitaxy is reinforced: this indicates that the (100) interface is preserved. Quite the contrary, after annealing under H_2/H_2S ambient, the (100) interface disappears.

36507 Influence of the crystallography on the incorporation of lattice dislocations in grain boundaries. Khalfallah, O. (Universite Paris-Sud, Orsay (France)); Priester, L. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Most generally, crystal dislocations may enter grain boundaries with little difficulty. The dissociation reactions of the incorporated dislocations in the grain boundaries have been widely studied, in particular in FCC materials. But the parameters which control in some cases the no incorporation of lattice dislocations have received few attention. This study is an attempt to analyze the influence of crystallography on the interaction between lattice dislocations and grain boundaries in a BCC iron-chromium alloy.

36508 Unusual segregation behavior of boron and its effect on segregation of sulfur in nickel. Ladna, B. (Univ. of Illinois, Urbana (USA)); Birnbaum, H.K. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The co-segregation of B and S to the surface and grain boundaries of Ni was studied by SAES and SIMS. B showed an unusual segregation behavior which resulted in the precipitation of Ni_3B in the near surface layer and a continuous monolayer type B segregation at the grain boundary. The S segregation was not influenced by the presence of B and resulted in a uniform monolayer surface and grain boundary coverage. Analysis of hydrogen charged samples fractured in situ suggests that B segregated to the boundaries has a beneficial effect on their strength and also reduces the negative effect of S segregation.

36509 Segregation energies of phosphorus and sulfur in various relaxed structures of grain boundaries in Ni by tight-binding approximation. Larere, A. (Universite Paris XI, Orsay (France)); Guillope, M.; Masuda-Jindo, K.I. pp. 4 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Grain boundary segregation of sp-valence impurities in Ni have been investigated using a tight-binding type electronic theory of s, p and d-basis orbitals. Two center integrals both for host and impurity atoms are determined within Harrison's universal scheme. The relative electronic energy levels Es, Ep and Ed of s, p and d basis orbital are taken from atomic structure calculations by Herman and Skillman and sp-valence impurities are assumed to be electrically neutral. Segregation energies are calculated for phosphorus and sulfur at $\Sigma = 5$ (210), $\Sigma = 5$ (310), $\Sigma = 11$ (310), $\Sigma = 11$ (113) grain boundaries, the structure of which was first relaxed by a quasi-dynamical technique. Their results show a qualitative agreement with experimental data of P and S segregation.

36510 Bismuth segregation in Cu-Bi bicrystals. Menyhard, M. (Univ. of Pennsylvania, Philadelphia (USA)); Blum, B.; McMahon, C.J. Jr.; Chikwambani, S.; Weertman, J. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The grain boundaries of randomly oriented Cu- Bi bicrystals containing about 300 wt ppm Bi were studied with a high-resolution scanning Auger microprobe. The non-planar interfaces, strongly facetted in many areas due to the Bi segregation, revealed a rather uniform Bi coverage despite a great variation in grain boundary structure. Particles concluded to be Bi were found on large areas of the intergranular fracture surfaces, apparently coexisting with the segregated layer of atomic bismuth. The Bi particles could be dissolved by heating the specimens to temperatures as low as 650°C and quenching.

36511 Enhanced concentrations of Ni at grain boundary dislocations in Ni-treated W. Lai, Z.H. (Chalmers Univ. of Technology, Goeteborg (Sweden)); Norden, H. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The enhanced concentration of Ni at grain boundaries and grain boundary dislocations in Ni treated W has been investigated using atom probe field-ion microscopy.

36512 Atomic resolution observations of solute-atom segregation and two-dimensional phase transitions at internal interfaces. Herschitz, R. (Northwestern Univ., Evanston, IL (USA)); Seidman, D.N. pp. 2 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Solute-atom segregation effects to individual stacking faults (SFs) in Co-0.96 at.% Nb and Co-0.98 at.% Fe alloys have been studied employing the atom-probe field-ion microscope (APFIM) and transmission electron diffraction technique. The mean composition of individual SFs was measured for bulk specimens which had been equilibrated in the range 450-575°C. In addition, the composition of the SFs was measured - employing the APFIM technique - with a spatial resolution, within the plane of the SFs, of ≈ 0.1 nm and with a spatial resolution of <0.4 nm perpendicular to the plane of the SFs. These measurements demonstrated the following: (a) The mean composition of the SFs increased with decreasing temperature according to an Arrhenius-like expression; (b) The Nb or Fe concentrations fall off very quickly with distance - within <0.4 nm form the plane of the SF the bulk concentration is achieved; (c) The SFs equilibrated above 450°C contained solute-atom fluctuations ($\approx$ to 2.0 nm diameter) which correspond to compositions with stoichiometries of $\approx Co_2Nb$ or $\approx Co_3Fe$.

36513 Grain boundary chemistry contributions to intergranular hot cracking. Thompson, R.G. (Univ. of Alabama, Birmingham (USA)); Radhakrishnan, B.; Mayo, D.E. pp. 10 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

This report presents recent findings concerning the role of intergranular chemistry in the mechanism of intergranular hot cracking IHC during welding. The IHC of the weld heat affected zone during welding has long been suspected of some relationship to residual elements. Until now, that relationship in nickel alloys had been lost due to the roles that bulk concentration, volume fraction of second phase, and heat treatment played in establishing the intergranular chemistry of the alloy. Experiments in this study correlated the IHC susceptibility with bulk sulfur and heat treatment. It is shown that increasing sulfur from 0.0008 to 0.009 weight percent caused a modest increase in IHC. However, heat treatment had a three fold greater effect on IHC than the sulfur range tested. It is postulated that, although an increase in bulk sulfur increases the intergranular sulfur level, heat treatment has a more potent effect on IHC through combined segregation and precipitation reactions. Auger spectroscopy, metallography, and IHC data are presented in defense of these arguments.

36514 Application of the embedded atom method to the fracture of interfaces. Baskes, M.I. (Sandia National Labs., Livermore, CA (USA)); Foiles, S.M.; Daw, M.S. pp. 14 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

A modern theory of metallic bonding, the Embedded Atom Method (EAM) provides a simple but accurate method of evaluating the energy and forces in a cluster of atoms. As an example of the utility of the EAM, surface segregation in Ni-Cu alloys and reconstruction of fcc(110) surfaces will be predicted and compared to experiment. Using energetics from the EAM and a Monte Carlo procedure, the structure and cohesive energy of grain boundaries in nickel and Ni_3Al are predicted. The brittle fracture strength of these boundaries at room temperature is determined using molecular dynamics calculations.

36515 Hetero phase boundaries in the silver-nickel system. Maurer, R. (Max-Planck-Institut fuer Metallforschung, Stuttgart (West Germany)); Fischmeister, H.F. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Using Gleiter's sphere rotation technique, the orientation relations of preferred heterophase boundaries have been determined in the system silver/nickel. Comparison with other sphere rotation studies shows great similarities between all systems studied so far, which include metals on oxides and on alkali halides. In all, 33 orientation types have been found; these can be reduced to 10 elementary boundary types if facetting and twinning at the boundary are admitted. In almost all systems, cube-on-cube is the most dominant orientation. Analysis of the preferred elementary boundaries shows that they do not conform to the lock-in or to the conventional coincidence model, but that they could be understood as coincidence boundaries with a considerably extended tolerance radius. It is suggested that such extended coincidence might not be unreasonable for pairs of materials with weak interphase bonding.

36516 Effect of high pressures on the mobility of atoms in grain boundaries. Lojkowski, W. (High Pressure Research Center, Warsaw (Poland)). pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The results of recent investigations of the effect of high pressures on grain boundary diffusion and grain boundary migration in Aluminum are compared. The activation volume for general grain boundaries migration was found to be less than 0.2 Ω (Ω - atomic volume). On the other hand the activation volume for diffusion along general boundaries and subboundaries is close to 0.8 Ω. A similar value for Ω was obtained for migration of subboundaries. It follows that the formation volume for detects controlling atomic mobility across general boundaries is significantly less than of those controlling diffusion along boundaries and dislocation climb.

36517 Common factors controlling grain and phase boundary energy. Lojkowski, W. (UNIPRESS, Sokolowska (Poland)); Fecht, H.J. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The low energy interfaces identified recently for the case of silver-silver grain boundaries as well as gold-LiF and silver-nickel interfaces by the method of sintering of spheres to flat substrate, were analyzed in a unified way. The special properties of some of those interfaces can be understood by taking into account that the following factors lead to a decrease of the interfacial energy: (i) a high fraction of atoms of one crystal locked in valleys on the surface of the other crystal, (ii) the locked atoms form close packed rows thus decreasing the elastic strain energy, (iii) in sectors separated by the locked atomic rows both crystals surfaces are parallel to low energy planes, (iv) the energy necessary to unlock an atom is higher than the energy of thermal vibrations.

36518 Electronic theory for grain boundary segregation and embrittlement of intermetallic compound Ni_3Al. Masuda-Jindo, K. (Tokyo Institute of Technology, Yokohama (Japan)). pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The cleavage strength of grain boundaries in $L1_2$ type of intermetallic compounds (Ni_3Al) is investigated using the tight-binding (TB) electronic theory of s, p and d-basis orbitals. The two center hopping integrals are determined by using the Harrison's universal TB theory and atomic energy levels are taken from the atomic structure calculations by Herman and Skillman. The local charge neutrality condition is used for both host metal and solute atoms. It is shown that cleavage strength of the grain boundaries depends strongly on the segregation of impurity atoms (boron) at the grain boundaries, in agreement with experimental results: the stoichiometry effect of the $L1_2$ compound is also discussed.

36519 Energy and structure of [100] aluminum grain boundary. Otsuki, A. (Kyoto Univ. (Japan)); Isono, H.; Mizuno, M. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The energy and structure of the [100] twist and tilt grain boundaries in aluminum have been studied by fracture stress and dihedral angle measurements. The relative boundary energy was estimated as a function of misorientation. The fracture stress and the dihedral angle show a discontinuous change at a temperature, suggesting a drastic change in the grain boundary energy at this temperature. This transition temperature was measured as a function of misorientation.

36520 Role of grain boundary structure on the electrochemical stability of passive films formed on high purity polycrystalline nickel. Palumbo, G. (Univ. of Toronto, Ontario (Canada)); Aust, K.T. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Electrochemical techniques were utilized in conjunction with SEM/ECP to investigate the effects of grain boundary structure (i.e. CSL) on the intergranular corrosion behavior of high purity polycrystalline Ni (99.999%) in 2 N H_2SO_4. Characteristic electrochemical potentials (Egb) for the initiation of grain boundary corrosion were found

to exist within the passive-transpassive potential range. These potentials were determined to be strongly structure-dependent (i.e. Σ, ΔΘ) with boundaries close to low-Σ CSL relationships displaying a high resistance to the initiation of localized attack (i.e. high Egb). These results are discussed in terms of the stability of passive films formed at crystalline defects.

36521 Grain boundary internal friction and relationship to intergranular fracture. Cosandey, F. (Rutgers, The State Univ., Piscataway, NJ (USA)). pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Creep rate, stress rupture and fracture mode have been measured on Ni-20 W/O Cr alloys containing 0 and 180 at. ppm Ce. Grain boundary viscosity and anelastic relaxation phenomena have been determined by high temperature internal friction measurements and results correlated to fracture behavior.

36522 Migration of differently oriented grain boundaries measured on Fe-3wt%Si 37° (001) bicrystals. Lejcek, P. (Institute of Physics, Prague (Czechoslovakia)); Paidar, V.; Grabski, M.W. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The dependence of the grain boundary migration on the orientation of the boundary surface was investigated on Fe-3wt%Si bicrystals with 37°(001) tilt grain boundary. It was found that the migration velocity is proportional to the driving force at sufficiently high temperatures and for large values of the imposed driving force. The emigration activation energy is 3.7 eV/at for symmetrical boundary while it is only about 1eV/at for asymmetrical one.

36523 Diffusion induced grain boundary migration in Ni(Zn) polycrystals. Fournelle, R.A. (Marquette Univ., Milwaukee, WI (USA)); Giakupian, B.; Gust, W.; Predel, B. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Diffusion induced grain boundary migration (DIGM) has been investigated in the Ni(Zn) system for the first time by zincification of pure Ni polycrystals. The morphology of the reaction has been studied on sections parallel and perpendicular to the specimen surface. In addition to DIGM, diffusion induced recrystallization (DIR) has also been observed. The experimental results show that the boundary migration velocity during DIGM is strongly dependent on the annealing temperature. Also, the velocity depends on the depth below the nickel surface. The greater the depth, the smaller the velocity. Concentration profiles have been measured by energy dispersive X-ray analysis (EDX). The Zn concentration depends on both the annealing conditions and the depth below the surface. The concentration profiles were used as the basis for calculating the driving force, the grain boundary diffusivity and the grain boundary mobility.

36524 Effect of the triple junction on grain-boundary sliding in aluminum tricrystals. Miura, S. (Kyoto Univ. (Japan)); Hashimoto, S.; Fujii, T.K. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Aluminum tricrystals were crept at 773K under a constant stress in order to investigate the effect of the triple junction on high temperature deformation. It has been demonstrated that grain-boundary sliding (GBS) can be accommodated by sliding and/or migration along other boundaries, but non-uniform sliding due to the existence of the triple junction gives rise to the localized deformation zone along the boundary. In certain cases, this could be accommodated by the so-called triple-point fold without significant plastic deformation interior the grain. The origin of the fold was found to be a lattice slip, whose activated system has to contain the triple junction, but not a deformation band.

36525 Strain-induced boundary migration (SIBM) in aluminum bicrystals each with a (211) tilt boundary. Inoko, F. (Technical College of Tokushima Univ. (Japan)); Kobayashi, M. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

In order to clarify the effect of edge dislocations on the occurrence of the strain-induced boundary migration (SIBM), aluminum bicrystals each with a (211) tilt grain boundary were prepared. The bicrystals were tensile-deformed to 0.3 and annealed under certain conditions. Consequently, in the grain boundary recrystallization in the bicrystals with the primary edge dislocations in the component crystal(s) parallel to the (211) tilt boundaries of large tilt angles, the SIBM mechanism played an important role. It could be considered that the phenomena of the SIBM are strongly related to the motion and annihilation of edge dislocations or their array, and the migration of the tilt boundaries with large tilt angles.

36526 Effect of thermal aging on mechanical and electrical properties of the MgO-partially stabilized zirconia bodies. Jung, H.J. (KAIST, Seoul (Korea)); Oh, Y.J.; Lee, H.L. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The effects of thermal aging on some properties and thermal-shock behavior of zirconia partially stabilized with 9 mol% MgO (9MZ) were studied. 9MZ specimens were aged over 1300-1400°C for 12 hours subsequently after sintering at 1650°C and for 4 hours. Fracture strength (both before and after thermal-shock test), linear thermal expansion, monoclinic fraction and phase transition by XRD, density, galvanic potential and microstructure were measured. Quantitative chemical analysis around the grain-boundary of the specimen aged at 1350°C was also conducted by EDX. The aging of 9MZ specimen causes a thermal decomposition of cubic-ZrO_2 into the formation of metastable tetragonal-ZrO_2 and MgO. The former increases the residual strength after thermal-shock test and the latter improves the thermal-shock resistance due to thermal conduction through the continuous phase of magnesia. The rate of thermal decomposition of cubic phase and the formation of monoclinic phase in matrix were increased with the decrease of aging temperature from 1400 to 1200°C. Galvanic potential of the aged specimen exhibited a proper emf characteristic.

36527 Dependence of diffusion-induced grain boundary migration on grain boundary structure. King, A.H. (State Univ. of New York, Stony Brook (USA)); Chen, F.S.; Jahn, R.J. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

An extensive series of experiments on the behavior of grain boundaries during the diffusion of zinc into copper has been performed. In symmetrical tilt bicrystals, it is found that the migration velocities are minimized for coincidence-related boundaries, and that these boundaries also exhibit the greatest depth penetration of solute, the highest concentration of solute behind the moving boundary and the most pronounced faceting. Transmission electron microscope investigations indicate that there are complex defect processes occurring during DIGM: notably, it is found that significant vacancy supersaturations exist in the material behind the moving boundary and that dislocations are ejected by the boundary. These results all suggest the importance of grain boundary defects in the DIGM process itself.

36528 Mechanical behaviors of SiC whisker reinforced Al composites by powder metallurgical process. Jeong, I.B. (Seoul National Univ. (Korea)); Oh, K.H.; Lee, H.I.; Lee, D.N.; Baek, Y.K. pp. 8 of Interface science and engineering '87. Les Editions de

Physique, Les Ulis Cedex, France (1988). (CONF-870793--: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Studies were undertaken to evaluate the tensile behavior of SiC-reinforced Al composite made by powder metallurgical process, where Al 2124 and X7091 were used as matrix alloys. Although the measured tensile strength did not reach to the predicted value, it was higher than that of the wrought Al alloys and increased with increasing volumic fraction of SiC whisker. By modifying Fukuda's probabilistic theory of short fiber composite strength, it turned out that the composite strength is dependent mainly upon critical zone width, maximum whisker alignment angle and critical fiber length. Composite failure was attributed to matrix fracture with fine dimples and partially whisker pull-out due to whisker/matrix debonding.

36529 Interdiffusion of Au/Ni/Cr on silicon substrate. Yan, B. (Shanghai Jiao Tong Univ. (China)); Lin, D.; Mao, D. pp. 4 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793--: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

By using surface resistance measurement and Auger Electron Spectroscopy, the interdiffusion behavior of Au/Ni/Cr metallization on silicon substrate was examined. Cr was proved to be an excellent diffusion barrier between Au and Si up to 450°C for a Cr layer of 550 Å thick which would avoid serious degradation of solderability and resistivity of the metallization. Ni was found much less effective as a diffusion barrier and therefore was mainly to improve the solderability. It was shown that silicon outdiffusion was dominant in the interdiffusion between gold overlayer and silicon substrate. It was attributed to the large grain boundary area and high defect density in the polycrystalline gold film.

36530 TEM study of diffusion-induced grain boundary migration in Ni-Cu diffusion couples. Liu, D. (Univ. of Toronto, Ontario (Canada)); Miller, W.A.; Aust, K.T. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793--: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

A study was conducted on defect structures, orientation relationships, and compositional profiles at DIGM boundaries in Ni-Cu diffusion couples. TEM revealed dislocations at the initial grain boundary positions of the DIGM zones in the Ni substrate. The misorientation between the DIGM zones and the matrix (across the dislocation wall) was determined by electron diffraction and found to be less than 0.5°. Cu profiles across the DIGM zones were obtained by TEM/EDS analysis. The formation of the dislocation wall is discussed in terms of the misorientation and lattice misfit between the DIGM zones and the matrix.

36531 Structure of small angle tilt boundaries and their behavior under the applied shear stresses in fcc metals. Minonishi, Y. (Tohoku Univ., Sendai (Japan)); Horiuchi, R. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793--: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

A molecular statics study has been performed on (112) symmetrical tilt boundaries in fcc metals using pair potentials fitted to Cu and Ni. Boundaries are found to consist of a pair of walls of Shockley partials in both metals; distance between walls is much smaller than that between partials of an isolated extended dislocation. The separation between partial dislocation walls decreases with the increasing tilt angle and boundaries eventually come to have different structures from those observed in lower angle boundaries when the tilt angle exceeds a critical value depending on the potentials used. The critical shear strain for motion of the boundaries increases with the increasing tilt angle which is in good qualitative agreement with experimental observations so far reported.

36532 Grain boundary electrical activity of n-type germanium. Tabet, N. (CNRS, Meudon (France)); Monty, C. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793--: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The electron beam induced current mode (EBIC) of the Scanning Electron Microscope has been used to characterize the electrical activity of grain boundaries in germanium samples (n-type, doped with P or Sb). The boundaries have also been characterized from a structural point of view using Electron Channeling Patterns and X-ray topography. Low angle boundaries show an EBIC contrast which increases when the primary electron beam accelerating voltage increases. The results have been analyzed using existing models; they are not able to well describe the observed behavior as they neglect the depletion zone contribution to the contrast.

36533 Dynamic studies of deformation and fracture at grain boundaries. Robertson, I.M. (Univ. of Illinois, Urbana (USA)); Bond, G.M.; Lee, T.C.; Shih, D.S.; Birnbaum, H.K. pp. 4 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793--: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The interaction of dislocations with grain boundaries in Ni, Ni_3Al, alpha-Ti and Ni-S, are being studied by the technique of in-situ TEM deformation. Under certain conditions, grain boundaries act as effective barriers to dislocation motion, resulting in incorporation of glide dislocations into the grain boundary without slip generation in the adjacent grain. The mechanism of stress relief at the boundary depends on the boundary microchemistry and the test conditions. Stress relief may occur by the nucleation and propagation of a crack along the boundary or by the sudden, massive generation of dislocations into the adjacent grain: the dislocation sources are in and adjacent to the grain boundary.

36534 Structure and properties of nanophase TiO_2. Siegel, R.W. (Argonne National Lab., IL (USA)); Hahn, H.; Ramasamy, S.; Zongquan, L.; Ting, L.; Gronsky, R. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). DOE Contract AC03-76SF00098. (CONF-870793--: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Ultrafine-grained, nanophase samples of TiO_2 (rutile) were synthesized by the gas-condensation method and subsequent in-situ compaction, and then studied by transmission electron microscopy, Vickers hardness measurements, and positron annihilation spectroscopy as a function of sintering temperature. The nanophase compacts densified rapidly above 500°C, with only a small increase in grain size. The hardness values obtained by this method are comparable to or greater than coarser-grained compacts, but at temperatures 400 to 600°C lower than conventional sintering temperatures and without the need for sintering aids.

36535 Electron microscopy studies of diffusion-induced grain boundary migration in ceramics. Vaudin, M.D. (National Bureau of Standards, Gaithersburg, MD (USA)); Handwerker, C.A.; Blendell, J.E. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793--: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The stability of grain boundaries during the uptake of solute into polycrystalline MgO has been investigated by exposing sintered, well-annealed MgO specimens to NiO at various temperatures for different times, and observing their microstructure both before and after this exposure. Electron and optical microscopy techniques have been used to characterize the specimen surface morphology, and the variation in composition and elastic and plastic strains in the interface regions. The spatial distribution of nickel at various depths below the original specimen surface was determined using electron microprobe analysis. The observations are discussed in terms of the coherency strain theory.

36536 Effect of grain-boundary structure on stress corrosion cracking in αCu-Al alloy bicrystals. Mimaki, T. (Doshisha Univ.,

Kyoto (Japan)); Yamashita, M.; Hashimoto, S.; Miura, S. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Intergranular stress-corrosion-cracking (SCC) of Cu9at.%Al alloy was studied in (110)-symmetrical tilt bicrystals having low-angles 3.7°, 8.6°, CSL/Σ = 3(111), Σ = 9(221), Σ = 11(311) boundaries with various grain boundary energies. The Σ = 3, 9 and 11 bicrystals were fractured intergranularly. The intergranular fractures did not occur until the applied stresses higher than the yield stresses. The grain boundary energy reflected the susceptibility to intergranular SCC in a lower stress level. Especially, the Σ = 3 boundary showed a higher resistance to the initiation of intergranular SCC. The small-angle tilt bicrystals had an extremely low susceptibility to intergranular SCC even under a high level of stress ratios.

36537 Effect of manganese on intergranular fracture in low alloy steels. Tatsumi, K. (Nippon Steel Corp., Kawasaki (Japan)); Okumura, N.; Yamamoto, M. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The grain boundary embrittlement of low alloy steels was studied, attention being paid to the effect of manganese concentration. The prior austenite grain boundary of tempered martensitic samples containing 0.5, 1.0, 1.5 wt% Mn were analyzed by AES. (1) Increasing bulk manganese content was found to cause a small increase in the amount of segregated phosphorus and a decrease in the amount of segregated carbon. (2) Measurements of internal friction (Snoek peak) showed that the addition of manganese lowered the concentration of dissolved carbon. Based on these facts, the embrittling effect of manganese can be explained by the decrease of the concentration of segregated carbon which strengthens grain boundaries.

36538 Special mechanical properties of very thin films. Tsakalakos, T. (Rutgers, The State Univ., Piscataway, NJ (USA)). pp. 12 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The mechanical properties of ultrathin layered films are presented. An enhanced modulus effect has been observed in several composition modulated thin film systems containing short wavelength modulations .8-10nm. The foils were produced by vapor deposition using two or three source evaporator. As compared with homogeneous foils of the same average composition, the modulated foils exhibited an appreciable increase (up to 300%) in modulus. The dependence of various moduli on the modulation parameters (wavelength, composition and amplitude) are described. The plastic behavior, breaking and microhardness of these foils are also presented as a function of the modulation parameters. Current theories based on electronic and strain effects on the elastic constants of metals are also presented to explain the origin of the supermodulus effect.

36539 Metastable ordered compounds formed during epitaxial growth. Flynn, C.P. (Univ. of Illinois, Urbana (USA)). pp. 12 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

New ordered compounds have recently been observed to form pseudomorphically during epitaxial growth. These phases do not appear on the equilibrium bulk phase diagram. The paper first reviews the current knowledge of epitaxial strain layers. A linear stability analysis is presented of the competition among disordered phases strained by an epitaxial constrain and of the corresponding ordered epitaxial compounds. The case of volume misfit for mixed alkali halides is carried through in detail to reveal the delicate energy balance, the orientation dependences involved, and the effects of lattice anharmonicity on phase competition at the growth temperature.

36540 Critical phenomenon and segregation behavior at interfaces and subgrain boundaries. Narayan, J. (North Carolina State Univ., Raleigh (USA)); Sharan, S.; Jagannadham, K. pp. 38 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The authors have analyzed two important phenomena in lattice mismatched systems: (1) critical stresses, strains and thicknesses, and (2) dopant/impurity segregation at coherent, semicoherent, incoherent interfaces and subgrain boundaries. During formation of epitaxial films, the growth (pseudomorphic) occurs up to a certain thickness with planar spacing normal to the interface being essentially the same both in the substrate and the film. Above a critical thickness it becomes energetically favorable for the film to contain dislocations. This occurs usually by generating glide dislocations near the free surface because there is a lack of dislocation sources in mostly defect-free semiconductor materials. They present an analysis of the critical phenomena in semiconductors based upon this experimental fact. In previous work, the critical step associated with the generation of dislocations was largely neglected. They also consider finite (island) growth of thin films and its effect on critical phenomena. The experimental results clearly show the presence of glide dislocations in Ge/Si and GaAs/Si systems with extra half planes being in the silicon substrate. If the growth or processing temperature is high enough, then the diffusion and segregation phenomena at dislocation arrays and interfaces become important. The interaction of dopants and impurities with dislocation arrays and interfaces results in a drift term in the diffusion equation, which leads to enhanced segregation of dopants and impurities. Such segregation effects are analyzed for Ge/Si and GaAs/Si interfaces as well as subgrain boundaries in silicon.

36541 Measurements of the elastic constants, the specific heat and the entropy of grain boundaries by means of ultrafine grained materials. Korn, D. (Universitaet des Saarlandes (West Germany)); Morsch, A.; Birringer, R.; Arnold, W.; Gleiter, H. pp. 12 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Measurements of the elastic constants, the specific heat and the entropy of grain boundaries have been performed by utilizing ultrafine grained materials (Pd, 6nm grain size; Mg, 12 nm grain size; CaF_2, 7 nm grain size) about 30 to 50 vol% of which consist of grain boundaries. The results obtained suggest that: (1) The interatomic potentials in grain boundaries in metals differ from the lattice potentials. hence, the application of lattice potentials for computer simulation of boundary structures in-metals may be of limited physical relevance. (2) Boundary entropy effects are significant for the interfacial structure above half the absolute melting temperature. (3) Metastable boundary structures with enhanced boundary entropies exist. The entropy enhancement may be several times the entropy of an equilibrated interface in the same material.

36542 Cu-AlN interface: electronic structure and adhesion. Ohuchi, F.S. (E.I. du Pont de Nemours and Co., Inc., Wilmington, DE (USA)). pp. 8 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Adhesion of Cu to AlN has been studied by semi-quantitative adhesion measurements. The authors show for the first time that the adhesion strength of Cu to AlN is strongly dependent on the AlN surface crystallographic orientations. The origin of the adhesion was attributed to the intrinsic nature of Cu-AlN interactions, where Cu prefers to bond to Al.

36543 Star-disclination in a ferro-elastic material B19 MgCd alloy. Kitano, Y. (Hiroshima Univ. (Japan)); Kifune, K.; Komura, Y. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Disclinations in thin crystals of MgCd alloy are demonstrated by high resolution electron microscopy. The disclinations appear along the intersection lines of twin boundaries which occur due to spontaneous lattice deformations at the phase transition temperature. A star-disclination which is not an intersection line comes out to compensate the strain field of the disclinations. A single disclination is seldom observed but dipoles, tripoles, quandrupoles and multipoles of disclinations are found in stable crystals.

36544 (EPRI-NP–6392-M) **Microstructure and stress corrosion resistance of alloys X-750, 718, and A-286 in LWR environments: Final report.** Miglin, M.T. Electric Power Research Inst., Palo Alto, CA (USA); Babcock and Wilcox Co., Alliance, OH (USA). Research Center. c Jun 1989. 65p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The results of microstructural characterization and stress corrosion cracking test are presented for several heat treatment conditions of age-hardenable alloys X-750, 718, and A-286 used for in-core components in light-water reactors. Resistance to intergranular stress corrosion cracking was evaluated using slow-strain-rate tests in pressurized-water-reactor primary water, and microstructural etch and rising-load quality assurance tests. Detailed microstructural characterization of these alloys was performed, and stress corrosion cracking susceptibility is related to microstructural features. Alloy X-750 microstructures with heavy grain boundary coverage by $Cr_{23}C_6$ show better resistance to stress corrosion cracking in primary water, despite grain boundary chromium depletion. Alloys 718 and A-286 have good resistance to cracking in the slow-strain-rate and quality assurance tests, although neither is immune to cracking in reactor service. Results are compared with those of a related program, including crack initiation and crack growth tests in pressurized-water and boiling-water reactor environments. Recommendations are made for improvements in the quality assurance tests and in heat treatment for alloy 718. 29 refs., 15 figs., 9 tabs.

36545 (FhG-IWM-W–2/88) **Recent advances in modelling creep crack growth. Proceedings.** Riedel, H. Fraunhofer-Institut fuer Werkstoffmechanik, Freiburg im Breisgau (Germany, F.R.). Aug 1988. 31p. (CONF-890310–: 7. international conference on fracture (ICF-7), Houston, Texas, USA, 20-24 Mar 1989). Order Number DE89782878/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

At the time of the previous International Conference on Fracture, the C* integral had long been recognized as a promising load parameter for correlating crack growth rates in creep-ductile materials. The measured crack growth rates as a function of C* and of the temperature could be understood on the basis of micromechanical models. The distinction between C*-controlled and K_I-controlled creep crack growth had been clarified and first attempts had been made to describe creep crack growth in the transient regime between elastic behavior and steady-state creep. This paper describes the progress in describing transient crack growth including the effect of primary creep. The effect of crack-tip geometry changes by blunting and by crack growth on the crack-tip fields and on the validity of C* is analyzed by idealizing the growing-crack geometry by a sharp notch and using recent solutions for the notch-tip fields. A few new three-dimensional calculations of C* are cited and important theoretical points are emphasized regarding the three-dimensional fields at crack tips. Finally, creep crack growth is described by continuum-damage models for which similarity solutions can be obtained. Crack growth under small-scale creep conditions turns out to be difficult to understand. Slightly different models yield very different crack growth rates. (orig.) With 4 figs.

36546 (FRCEA-TH–153) **Dynamical properties in metallic reentrant in spin glasses studied by inelastic neutron scattering.** Lequien, S. Paris-11 Univ., 91 - Orsay (France). Jan 1988. 133p. (In French). Order Number DE89789233/JAW. Available from NTIS (US Sales Only), PC A07/MF A01.

We have studied the temperature dependence of the magnetic collective excitations in two ferromagnetic reentrant systems $(Fe_{1-x}Mn_x)_{75}P_{16}B_6Al_3$ and $Cr_{1-x}Fe_x$. The excitations are spin waves obeying the dispersion relation $\omega = \Delta + Dq^2$, where D is the magnetic stiffness constant of the system. Our measurements, using inelastic neutrons scattering, evidenced large anomalies on the thermal evolution of the magnetic dynamics the concentration dependence of which is also reported. The concentration dependence determined on a-FeMn allows us to understand better the behaviour reported for other systems where less precise measurements lead to erroneous conclusions. This point of view has been corroborated by a reexamination of the CrFe, first compound of this kind which had been studied by inelastic neutron studies. Our observations allow an interesting check for mechanisms homogeneous or inhomogeneous, which may be put forward in these systems. Associated to the observations by elastic neutron scattering they provide a new material for theoretical models.

Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 1(20).

Model of calculating formation of camber and surface of welded point under welding by impulse penetrative arc is presented. The specific feature of the model lies in the fact, that it takes into account two simultaneous processes: metal movement to equilibrium state and crystallizatin of liquid metal of a pool . Correlation of calculation and experimental results shows the sufficient adequacy of the model and real processes. The model can be used for analyzing the process of welding by pulse penetrative arc and for evaluating camber and shape of the surface of crystallized metal in a pool. 5 refs.; 4 figs.; 1 tab.

36561 (INIS-SU–95, pp. 17-19) **Increasing of effeciency and quality of electron beam welding of zirconium alloys by using and additional vacuum chamber.** Fokin, G.D. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Welding in nuclear technology. Scientific-technical collection.* Order Number DE89012167/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 1(20).

Application of additional vacuum chamber is described. It enables to reduce not less, than five times, the period of evacuation up to high vacuum and therefore to increase welding efficiency. Application of additional vacuum chamber excludes the necessity of atmosphere overlap in welding chamber. This enables to preserve high vacuum growing with time, in welding chamber; welding quality is improved at that. 2 refs.; 1 fig.

36562 (INIS-SU–95, pp. 19-25) **Optimization of technological parameters of welding process by stabilized arc of reverse polarity.** Poloskov, S.I.; Bukarov, V.A.; Burlakov, I.A.; Dorina, T.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 1(20).

Consideration is being given to results of analyzing relative heat losses in nonconsumable electrode-anode and for scattering in surrounding space, as well as effective efficiency of welding process of aluminium alloys by stabilized arc of reverse polarity. High-speed gas flow G_{AR}, providing convective arc heat-exchange with surrounding space represents the most significant parameter from the viewpoint of energy radistribution in the system electrode-arc-sample. 9 refs.; 5 figs.; 4 tabs.

36563 (INIS-SU–95, pp. 31-32) **Installation for semiautomatic air-plasma metal cutting up to 6 mm thickness.** Bejder, B.D.; Tkachev, M.V.; Rozhnov, V.S.; Budakov, A.A.; Shevchuk, I.M. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Welding in nuclear technology. Scientific-technical collection.* Order Number DE89012167/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 1(20).

SA401M2 installation for semiautomatic air-plasma cutting is described. Results of metallographic investigations and gas analysis of cutting edges of low-carbon steel are presented. It is shown that SA401M2 installation provides separation of metal up to 6 mm thickness at 45-85A current when nozzle is resting on a sample. 2 refs.; 3 figs.

36564 (INIS-SU–95, pp. 37-40) **On the question of nonconsumable electrode measuring of temperature in the process of argon-arc welding.** Anisimov, V.V.; Bukarov, V.A.; Nesterov, A.F.; Ryabichenko, B.R.; Alenichkin, A.S. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Welding in nuclear technology. Scientific-technical collection.* Order Number DE89012167/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 1(20).

Consideration is given to results of investigations into the dependences of radiation intensity of nonconsumable electrodes of various types on their temperature during welding. The error, introduced by arc radiation into the measured temperature value when measuring in infrared spectrum region, was determined. 3 refs.; 5 figs.

36565 (INIS-SU–95, pp. 43-45) **Effect of construction of current and gas supply on protective atmosphere composition in welded installation.** Butylkin, B.B.; Shchavelev, L.N.; Prokhorova, L.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Welding in nuclear technology. Scientific-technical collection.* Order Number DE89012167/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 1(20).

Influence of construction of current and gas supply to a burnes on the purity of argon, passing through it is investigated. The experiments conducted testify to inefficiency of using combined gas and current supplies in welded installations. The obtained dependences are presented. Recommendations on sustaining composition of protective gas when using combined current and gas supply are given. 2 refs.; 3 figs.

36566 (INIS-SU–95, pp. 45-50) **New generation of welded semiautomatic for production of structures out of steels and aluminium alloys.** Belousov, A.N.; Poloskov, S.I.; Efanov, V.A.; Sedov, Yu.S.; Bukhta, O.Ya. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Welding in nuclear technology. Scientific-technical collection.* Order Number DE89012167/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 1(20).

Analysis of the type of semiautomatic welding machines, produced in our country and abroad, is presented. New designs, realized in the 80th, are described. Design of KOMBI-500 and PRM-4M semiautomatic welding machines is described. 8 refs.; 3 figs.; 1 tab.

36567 (INIS-SU–95, pp. 3-8) **On the properties of new corrosion-resistant high-strength steel 06Kh17G19N3AB and it welded joints.** Zakharov, Yu.V.; Roshchin, V.V.; Rumyantseva, L.E.; Fedyakin, P.N.; Semakin, I.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Welding in nuclear technology. Scientific-technical collection.* Order Number DE89012167/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 1(20).

Consideration is given to results of investigation of weldability, mechanical and corrosion properties of welded joints, as well as metallographic investigations of a new 03Kh17G19N3AB (AS-43N) steel with low nickel content. AS-43N steel is welded satisfactorily by argan-arc, electric arc, submerged arc welding and is suitable for application at temperatures up to 350 deg C. 3 refs.; 5 figs.; 4 tabs.

36568 (INIS-SU–95, pp. 25-28) **Diffusion at explosion welding of titanium with steel.** Gul'bin, V.V.; Ryabchikov, E.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Welding in nuclear technology. Scientific-technical collection.* Order Number DE89012167/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 1(20).

Diffusion in titanium-steel bimetal at explosion welding was investigated. It was established that metal mass transfer took place, most activelyfrom lower plate to the upper one by mutualdiffusion with high speed and preliminarily due to elevation of defect concentration in crystal lattice. 6 refs.; 2 figs.; 2 tabs.

36569 (INIS-SU–95, pp. 50-53) **Introduction of experience of television information-control systems in welding.** Lifshits, M.L.; Lobanova, N.G. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Welding in nuclear technology. Scientific-technical collection.* Order Number DE89012167/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 1(20).

Consideration is given to peculiarities of using television measuring system for operative control of electron-beam welding of articles with minimum joint gap. It is shown that improvement of control accuracy requires mounting and tuning of television sensors and providing for process procedure. 3 refs.; 1 fig.; 1 tab.

36570 (INIS-SU–95, pp. 14-17) **Methods of deformation estimation of weldpool surfaces from action of localized pressure under through fusion.** Ishchenko, Yu.S.; Khas'yanova, G.L.; Bukarov, V.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 1(20).

Method for estimating deformation of upper and lower pool surfaces from the action of gas-dynamic jet is suggested. Effect of jet parameters (pressure and affected zone) on surface deformation is shown. 5 refs.; 5 figs.

36571 (Jul–2244) **Fracture mechanics investigations for components of the steam cycle in an HTR electricity producing plant.** Roedig, M.; Pfaffelhuber, M.; Klomfass, J.; Schubert, F.; Nickel, H. Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorwerkstoffe. Nov 1988. 104p. (In German). Order Number DE89788399/JAW. Available from NTIS (US Sales Only), PC A06/MF A01.

Investigations on the fracture mechanics behaviour of X10 NiCrAlTi 32 20 (Alloy 800) have been performed at temperatures of 550^{0}C and 700^{0}C. These investigations were part of the safety philosophy for the steam cycle of a power producing HTGR-plant. An emphasis was laid on the demonstration of the transferability of creep and fatigue crack growth laws. The fatigue crack growth data measured with several standard specimens are in good agreement. So it can be assumed, that a description of the fatigue crack growth by means of the linear-elastic ΔK_I-parameter is valid. In addition an experiment was performed with a thick walled tube in four point bending, containing a non through wall circumferential crack. By several approximation methods a conservative estimation of the fatigue crack growth in this tube is possible. The creep crack growth in standard specimens is well described by the energy rate integral C*. The linear-elastic description by means of K_I gives a large scatter of data, hence K_I seems not to be a valid parameter for the description of the creep crack growth. In thin walled heat exchanger tubes with circumferential cracks in tension, the fatigue crack growth very roughly can be described by means of the ΔK_I-parameter. This is valid although the formal suppositions are not fulfilled. The failure stress for these tubes in tensile loading is described conservatively by means of the Battelle formula.

36572 (LA-UR–89-1241) **Polycrystal plasticity as applied to the problem of in-plane anisotropy in rolled cubic metals.** Rollett, A.D.; Stout, M.G.; Kocks, U.F. Los Alamos National Lab., NM (USA). 1989. 4p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890772–1: Plasticity '89: international symposium on plasticity, Ton, Japan, 31 Jul - 4 aug 1989). Order Number DE89011181/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A fundamental property of cubic metals is that slip occurs on close-packed planes in close-packed directions, which for the f.c.c. case results in 12 {111}<110> slip systems. This crystallographic restriction on the plastic behavior causes significant crystallographic preferred orientation (texture), hence anisotropy, to develop once a large strain has been imposed. Moreover, whereas annealing can generally "reset" the flow stress and ductility, it does not generally randomize the texture: therefore most metallic materials have some degree of texture and consequent anisotropy. The problem of earing in deep drawing can be simply related to the variation of r-value with angle from the rolling direction, i.e. the in-plane anisotropy of the sheet. The r-value can be calculated from a given texture with the use of a polycrystal plasticity model. The Los Alamos polycrystal plasticity (LApp) code is based on the Bishop-Hill single crystal yield surface (SCYS) but with a mildly strain-rate sensitive modification where the stress exponent is of order 30. This modification of the SCYS removes the ambiguity of slip system selection inherent in the Bishop-Hill formulation and permits other phenomena to be treated such as latent hardening and pencil glide. The use of LApp to simulate texture formation and consequent anisotropy is described. Experimental textures in the form of X-ray pole figures are analyzed with a Williams-Imhof-Matthies-Vinel (WIMV) code, as implemented by Kallend, to give full orientation distributions (OD's). The OD obtained this way contains approximately 5000 points on a 5° by 5° lattice; this is used to assign weights to approximately 1000 discrete orientations for calculations with LApp. 11 refs., 2 figs.

36573 (LA-UR–89-1423) **The response of single crystal and polycrystal nickel to quasistatic and shock deformation.** Follansbee, P.S.; Gray, G.T. III. Los Alamos National Lab., NM (USA). 1989. 4p. Sponsored by DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-890772–2: Plasticity '89: international symposium on plasticity, Ton, Japan, 31 Jul - 4 aug 1989). Order Number DE89011168/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Stress-strain measurements and TEM observations in shock-deformed nickel single and polycrystalline samples are reported. When the stress measurements are normalized by the appropriate Taylor factor, the shock induced strain hardening is shown to be similar in all materials studied. 6 refs., 1 fig., 1 tab.

36574 (LBL–25831) **Observations on the mechanisms of fatigue in eutectic Pb-Sn solder joints.** Tribula, D.; Grivas, D.; Frear, D.R.; Morris, J.W. Jr. Lawrence Berkeley Lab., CA (USA). Aug 1988. 22p. DOE Contract AC03-76SF00098. (CONF-881120–10: ASME winter annual meeting, Chicago, IL, US, November 28, 1988). Order Number DE89000553/JAW. Available from NTIS, PC A03/MF A01.

Near-eutectic Pb-Sn solders are widely used for joints in electrical devices. These are liable to failure by thermal fatigue during operation of the device. Since the thermal fatigue load is often in shear, the mechanisms of thermal fatigue in shear fare of particular interest. Recent research has shown that the thermal fatigue of eutectic solders in shear is preceded by the formation of bands of coarsened material in the eutectic microstructure, which concentrate the deformation and cause the nucleation of fatigue cracks. Such coarsened bands are also observed in isothermal fatigue and unidirectional creep in shear. Since creep experiments are relatively simple to conduct and analyze, these have been used to study the formation and growth of coarsened bands. The mechanism includes three steps: the formation of inhomogeneous shear bands, the onset of recrystallization in the shear band to create a planar region of coarsened material, and the propagation of the coarsened band by progressive recrystallization at its tip. The results are applied to thermal fatigue and some of their implications are discussed. 12 refs., 12 figs.

36575 (LBL–26942) **History of the application of the generalized Lewis acid-base theory to metals.** Brewer, L. Lawrence Berkeley Lab., CA (USA). Nov 1988. 6p. Sponsored by DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-8809360–1: World material congress, Chicago, Illinois, USA, 24-26 Sep 1988). Order Number DE89012992/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The history of my experiences with intermetallics has been found useful by students seeking my advice on which directions in science they should be emphasizing. In response to their question, I point to a mobile in my office consisting of seven hands pointing in different directions. Science comes up with so many unexpected developments that one's education should have a broad enough base to allow one to branch out in any direction to take advantage of unexpected opportunities. My historical presentation will be a personal account that I hope will serve as a guide to students. There have been many unexpected abrupt changes in my research.

36576 (LBL–27271) **Vertical gradient freeze GaAs: Growth and electrical properties.** Galiano, M.L. Lawrence Berkeley Lab., CA (USA). May 1989. 66p. Sponsored by DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE89014894/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

We have investigated the influence of silicon contamination prevention methods on the electrical properties of GaAs grown by the Vertical Gradient Freeze (VGF) technique. We report the effectiveness of these methods for GaAs crystals grown from two different starting materials: n-type with resistivities in the range of 10^{-1} to 10^3 Ω-cm and semi-insulating (SI) with a resistivity of 10^8 Ω-cm. We have found that the impurities in the starting materials, specifically boron, carbon and silicon, have an effect on the ability to control silicon contamination with methods that have been reported previously in the literature. We also report the attainment of SI crystals using a PBN crucible, a SI charge and B_2O_3 encapsulation. 61 refs., 13 figs., 7 tabs.

36577 (MTI–88-TR-10) **Heat exchanger development for steam-injected Brayton cycle: Final report for period September 30, 1984 to April 30, 1988.** Cain, W.G. Mechanical Technology, Inc., Latham, NY (USA). Apr 1988. 184p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract FG02-84CE40690. Order Number DE89012687/JAW. Available from NTIS, PC A09/MF A01 - OSTI; GPO Dep.

A steam-injected, externally fired, gas turbine power cycle offers advantages over other cycles for the cogeneration of process steam and electric power, utilizing nonpremium solid fuels. One aspect of

this innovative cogeneration cycle gives rise to a need for technology not yet available, heating a mixture of compressed air and steam to 1500°F in an externally fired air heater, prior to expansion through a power turbine. Under this program, funded by the Department of Energy (DOE) and the New York State Energy and Research Development Authority (NYSERDA), Mechanical Technology Incorporated investigated the interaction of common phosphate and hydroxide with typical high-temperature heat exchanger materials in the 1500°F operating environment to determine the expected life of the heat exchanger based on the measured corrosion rate. The program consists of a performance study, a 1000-hr screening test of three heat exchanger materials and three water treatment systems, and a 4000-hr endurance test. This report details the results of the performance study that describes several methods of increasing system efficiency, of the 1000-hr screening test in which 347H stainless steel combined with the coordinated phosphate water treatment system was slightly favored at 1350°F, and of the 4000-hr endurance test in which Incoloy 800H was found to have the least amount of corrosion and erosion at 1500°F. 7 refs., 69 figs., 23 tabs.

36578 (NUREG/CR–5216-Rev.1) **Post-irradiation fracture toughness characterization of four lab-melt plates: Revision 1.** Hiser, A.L. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Engineering; Materials Engineering Associates, Inc., Lanham, MD (USA). Jun 1989. 104p. Sponsored by Nuclear Regulatory Commission. (MEA–2311-Rev.1). Available from NTIS, PC A06/MF A01 - GPO - OSTI.

Previous work indicated that the irradiation-induced transition temperature elevation (ΔT) evaluated from Charpy-V (C_v) data at the 41 J (30 ft-lb) level can give a nonconservative estimate of the ΔT of the static fracture toughness (K_{Jc}) curve at the 100 MPa$\sqrt{m}$ (91 ksi$\sqrt{in.}$) level. This trend was most evident for base metals (plate and forging). The present study looked at the effect of the chemical composition on the relationship between ΔT and C_v and ΔT from K_{Jc}. Four steel plates, having different contents of copper, nickel and phosphorus for different degrees of radiation sensitivity, were used. Static fracture toughness, C_v and tensile tests of the unirradiated and the irradiated conditions were made. In addition, rapid load fracture toughness and drop weight tests of the unirradiated condition were made. The results for the four plates indicate that the correspondence between ΔT from C_v and ΔT from K_{Jc} is not affected significantly by differences in copper, nickel and/or phosphorus content. In each data set, the ΔT from C_v underestimates the ΔT from K_{Jc} measured by C tests. 11 refs., 51 figs., 40 tabs.

36579 (NUREG/CR–5238) **Development of an engineering definition of the extent of J singularity controlled crack growth.** Joyce, J.A.; Hackett, E.M. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Engineering; Naval Academy, Annapolis, MD (USA); David Taylor Research Center, Annapolis, MD (USA). May 1989. 32p. Sponsored by Nuclear Regulatory Commission. Available from NTIS, PC A03/MF A01 - GPO - OSTI.

An experimental definition is proposed for the extent of singularity controlled behavior in a J-resistance fracture test. The singularity zone is defined in terms of a constant ratio of plastic crack opening displacement and normalized crack extension. Justification for this definition is given in terms of experimental results on compact specimens of three steel alloys of varying material toughnesses and in terms of a simple analytical model. The experimental limit can be evaluated from the data normally obtained during an unloading compliance single specimen J integral resistance curve experiment. Generally the experimental singularity limit extends the region of test validity well beyond that which is presently allowed by the ASTM J-R test standard, E1152. 15 refs., 17 figs., 3 tabs.

36580 (PNL-SA–16211) **Theoretical analysis of phase transformations in Fe-Ni "Invar"-type alloys.** Russell, K.C.; Garner, F.A. Pacific Northwest Lab., Richland, WA (USA). Feb 1989. 33p. Sponsored by DOE Energy Research. DOE Contract AC06-76RL01830. (CONF-8902117–1: Symposium on physical metallurgh of controlled expansion invar- type alloys, Las Vegas, NV, USA, 28 Feb 1989). Order Number DE89014454/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Many studies have suggested that Fe-Ni and Fe-Ni-Cr alloys of ca. 35 at. % Ni are susceptible to decomposition into two FCC phases. We herein model the kinetics and thermodynamics of spinodal decomposition, nucleation, growth, and coarsening of these alloys. Prediction of the scale of a microstructure formed by growth or coarsening may be done with some confidence. The absence of a model for surface energy and gradient energy in systems with negative departure from ideality reduce us to little more than guesses for the kinetics of nucleation and of spinodal decomposition. We combine our calculations with those of others and studies of terrestrial and celestial decomposition to suggest a miscibility gap for Fe-Ni alloys. The gap is very narrow at high temperatures but is broadened at low temperatures by magnetic effects. 29 refs., 15 figs.

36581 (RFP-Trans–500) **Studies on work-softening processes in the hot forming of austenitic steel.** Buehler, H.; Bobbert, D.; Rose, A. 21p. Translated from Stahl und Eisen (F.R. Germany). *Stahl und Eisen (F.R. Germany),* 90(1): 21-28 (1970). Sponsored by DOE Defense Programs. DOE Contract AC04-76DP03533.

Studies on the phenomena of stress relieving in the hot shaping of austenitic steel. Material examined: austenitic steel X 10 CrNiTi 18 10 containing about 0.05% C, 0.4% Si, 1.5% Mn, 17.6% Cr, 11.0% Ni and 0.3% Ti. Investigation of the progress of stress relieving after hot shaping by upsetting in the temperature range of 900 to 1200°C with deformation rates of 25.50 to 75% within the period of 2 and 150 seconds after deformation. Tracing of the processes of relaxation, polygonization and recrystallization by hardness measurements, structure and texture examinations, measurement of the deformation stress in the interrupted upsetting process and electron-optical observations. 17 refs., 10 figs.

36582 (SAND–87-1249) **A method of removing oxides from the surface of Fe-Ni-Co alloy particles by chemical etching.** Yelton, W.G. Sandia National Labs., Albuquerque, NM (USA). Apr 1989. 27p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE89014597/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The addition of metal particles to bulk glass has been shown to increase fracture strength and toughness. Composites containing well-bonded particles exhibit the largest increases in these properties. This report discusses a study in which a method was developed to alter the surfaces of Fe–Ni–Co particles so that improved particle/glass matrix bonding resulted. In this method, as received Fe–Ni–Co particles were intentionally oxidized to create surface and grain boundary oxides. The surface and grain boundary oxides were then preferentially removed from the surfaces of iron-nickel-cobalt alloy particles by chemical etching. After removal of the surface oxides, coral-like structures remained on the surfaces of the metal particles and furnished good mechanical bonding sites to the glass matrix. The progression of this study involved completion of three designed experiments. In the first experiment, an etching process was identified by controlling etching solution temperature and hold time. Data from the first study were then incorporated into the design of a second experiment which examined solution temperature heating rate and hold time at 60°C. Finally, the best conditions of the previous studies were selected to investigate the effects of the agitation rate of the etching solution on the particle yield. Combining the best conditions from each study yielded the most efficient method of removing oxides, in which a solution of 120 ml/l H_3PO_4 and 50 ml/l HCl was heated at 1°C/min to 60°C, held at 60°C, and then moderately agitated for 30 min. 6 refs., 18 figs., 2 tabs.

36583 (SAND–88-0973C) **Mechanisms that control the geometry of pulsed Nd:YAG laser welds.** Jellison, J.L.; Russo, A.J.; Peebles, H.C.; Williamson, R.L. Sandia National Labs., Albuquerque, NM (USA). 1988. 24p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-8810176–5: JOWOG 22D joining subgroup, Aldermasten, UK, 4-6 Oct 1988). Order Number DE89014490/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A two-dimensional conduction laser welding code developed by Russo overpredicted the geometry of pulsed welds for welding parameters typically used in production. At low heat fluxes, however, there was good agreement between the experimental results and the welding code. The limitations of the code appear to result from ignoring some of the important physics of the laser welding processes. Subsequent experimental process research and further

efforts have concentrated on beam-plume interactions and weld pool convection. A key experiment that has been used in testing the physical models is one where the role of a surface active element in controlling the geometry of austenitic stainless steels welds was evaluated. This experiment involved a significant range of heat fluxes and addressed the role of the laser plume. In this paper, both experimental and theoretical studies of the laser plume are discussed. Furthermore, the role of surface tension-driven convection (Marangoni flow) is explored. The results of this research are used to explain the geometry of austenitic stainless steel welds from the above experiment. 8 refs., 7 figs.

36584 (SAND–89-0506C) **Diamagnetic shielding and flux creep in a Tl-Ba-Ca-Cu-O thin film.** Venturini, E.L.; Kwak, J.F.; Ginley, D.S.; Baughman, R.J.; Morosin, B. Sandia National Labs., Albuquerque, NM (USA). 1989. 2p. Sponsored by DOE Energy Research. DOE Contract AC04-76DP00789. (CONF-890718–6: International conference on materials and mechanisms of superconductivity - high-temperature superconductors, Stanford, CA, USA, 23-28 Jul 1989). Order Number DE89014550/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Static magnetization data for a superconducting thin film based on the Tl-Ba-Ca-Cu-O system are presented and discussed. The film, deposited by electron-beam evaporation onto a single crystal $SrTiO_3$ substrate, consists of large grains of two superconducting structural phases with their crystallographic c axes normal to the substrate. It exhibits substantial transport critical current density, large diamagnetic shielding, and activated flux creep, consistent with strong intergranular links but weak flux pinning. 7 refs., 2 figs.

36585 (SAND–89-0521) **A test system for thermomechanical fatigue of solder joints.** Schmale, D.T.; Frear, D.R. Sandia National Labs., Albuquerque, NM (USA). Jun 1989. 26p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE89013886/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The thermomechanical fatigue behavior of solder joints is a critical reliability issue in electronic packaging. A need exists for a thorough metallurgical understanding of solder joints in conditions of thermal fatigue. This paper presents a method to test solder joints under conditions of thermomechanical fatigue. This method involves simultaneous imposition of temperature and strain cycles on discrete solder joints in a shear orientation. The stress, microstructure, and number of cycles to failure are monitored. Cycles to failure are determined by a continuous electrical resistance detection method. 60Sn-40Pb and 40Sn-40In-20Pb solder joints were tested using this new method at 20% shear strain. 4 refs., 7 figs.

36586 (SAND–89-0815C) **Thermal strains in a bimaterial joint: Experimental and numerical analysis.** Wood, J.D.; Tsai, M.Y.; Post, D.; Morton, J.; Parks, V.J.; Gerstle, F.P. Jr. Sandia National Labs., Albuquerque, NM (USA). 1989. 9p. Sponsored by Department of Defense. DOE Contract AC04-76DP00789. (CONF-8905107–4: SEM spring meeting, Cambridge, Massachusetts, USA, 28 May - 2 jun 1989). Order Number DE89013935/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A comprehensive stress analysis was performed for a bimaterial plate subjected to a uniform change of temperature. The steel and brass portions of the specimen were bonded along a common edge. Whole-field measurements were made by high-sensitivity moire interferometry. A companion finite element numerical analysis of a similar body was conducted to help interpret the experimental results. The experiments documented a strong free-edge effect along the entire perimeter of the joint, an effect akin to a line singularity along the perimeter. High stresses in the edge-effected zone were determined from measurements, and enormous stress gradients were deduced by analysis. The largest stresses were found at the corner, where two edge-effected zones intersected. 5 refs., 8 figs.

36587 (UCRL–101189) **PFMS [Precision Flexible Manufacturing System] tool characterization study at Lawrence Livermore National Laboratory.** Hansen, H.J.; Prokosch, M.W. Lawrence Livermore National Lab., CA (USA). 2 Jun 1989. 35p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-8906136–1: Machine tool subgroup spring meeting, Pinnellas, FL, USA, 6-8 Jun 1989). Order Number DE89013775/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A tool characterization study was conducted as part of the modeling effort at LLNL in support of the Y-12 Enhanced T-base Project. The goal of the study was to identify tool error sources and measure their influence on the finish machining process of D-38 Hemi Shells. This paper outlines the procedures and results of this study. The condition of new carbide inserts used at Y-12 are examined including insert edge quality, geometry, and tool radius size and contour deviation. Test parts were cut on LLNL's Pneumo Precision T-Base lathe according to common Y-12 finishing procedures. Part profile and tool contour were measured before and after each cut. The effect of initial tool profile errors and tool wear during the cut are discussed as they relate to the finished part profile. Insert and part inspection procedures are covered in detail. The established tool wear patterns for both the .002" and the .005" depths of cut typically used at Y-12 are presented. Additional tool error source observations are also included. 22 figs.

36588 (WHC-SA–0536) **Creep-fatigue assessment methods using elastic analysis results and adjustments.** Severud, L.K. Westinghouse Hanford Co., Richland, WA (USA). Mar 1989. 10p. Sponsored by DOE Nuclear Energy. DOE Contract AC06-87RL10930. (CONF-890721–30: Joint ASME/JSME pressure vessel and piping conference, Honolulu, Hawaii, USA, 23-27 Jul 1989). Order Number DE89011858/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The design of mechanical components that operate in elevated temperature environment where creep effects are significant usually requires creep-fatigue assessments. The ASME Code Case N-47 contains rules for these assessments based on both inelastic and elastic stress analysis. Although an inelastic stress analysis generally more accurately predicts effects from creep and plasticity, an elastic analysis is often preferred since it is much simpler and less costly. New creep-fatigue rules for use with elastic analysis results have recently been proposed to enhance the rules' accuracy and usefulness. This paper describes such new methods and rules for creep-fatigue assessments. Ingredients of the new methods include elastic follow up, ratcheting, multiaxiality, plasticity, creep, and relaxation considerations and associated adjustment factors. The basis for the adjustments and a comparison of results to those obtained using inelastic analysis are provided. The new methods will provide a wide range of practical application of elastic creep-fatigue rules than permitted by previous code methods in design of components for elevated temperature service. 21 refs., 13 figs.

36589 **Proceedings of the 3rd Berkeley conference on corrosion-erosion-wear of materials at elevated temperatures.** Levy, A.V. 396p. National Assoc. of Corrosion Engineers, Houston, TX (1987). (CONF-860104–: 3. Berkeley conference on elevated temperature corrosion-erosion-wear of materials, Berkeley, CA, USA, 27-29 Jan 1986).

This book contains 26 selections. Some of the titles are: Oxygen-sulfur corrosion of metals in mixed-gas atmospheres; Ceramic thermal barrier coatings for electric utility gas turbine engines; Erosion of ceramics; Erosion studies with fluid catalytic cracking catalysts and Effects of material and test variables on abrasion.

36590 **Metallurgical aspects of crack-tip failure processes.** Gerberich, W.W. (Chemical Engineering and Materials Science, Univ. of Minnesota, Minneapolis, MN (US)). v.v of Proceedings of the eighteenth national symposium on fracture mechanics. Read, D.T.; Reed, R.P. ASTM, Philadelphia, PA (1988). (CONF-850679–: 18. American Society for Testing and Materials national symposium on fracture mechanics, Boulder, Colorado, USA, 25-27 Jun 1985).

Process zone models for fracture of fiber-reinforced concrete, metal-particle reinforced glass, and polymer crazes have good experimental verification. This is because the microfracture process zone is often macroscopic in size or easily identifiable or both. Similar models have been proposed for metals and ceramic microstructures. This paper addresses how the microfracture process zone develops in such microstructures. Specifically, the microcrack evolution process may be controlled by chemistry and microstructure as well as localized stress distributions. The importance of this is that the microcrack distribution and the energy dissipation process in the remaining ligaments behind the advancing crack front

control the R-curve and final fracture instability. Examples of R-curve behavior in ductile fracture and semibrittle composites are shown, and a model for brittle fracture of steel is proposed. The latter shows that a semi-cohesive process zone of variable size and strength may represent an approach to brittle fracture where weakest-link models are not applicable. Predictions of fracture toughness for ferrite/pearlite steels as a function of test temperature and grain size are obtained with such an approach.

36591 Cracking of Alloy 800 tubing in superheated steam sections of the solar one central receiver. Lippold, C. (Sandia National Labs., Livermore, CA (US)). v.v of Corrosion '85. National Assoc. of Corrosion Engineers, Houston, TX (1985). (CONF-850311–: National Association of Corrosion Engineers annual meeting and materials performance and corrosion show, Boston, MA, USA, 25-29 Mar 1985).

Severe cracking has been observed in tube bend regions of receiver tubes which operate in the temperature range from 550 to 650^{0}C. The cracks initiate in the crown of the tube bend on the tube I.D. and propagate transgranularly through the tube wall. The paper describes the metallurgical and mechanical issues which are responsible for these premature failures.

36592 Role of residual stress in stress corrosion cracking in Alloy 600 tubes - Part I. Bandy, R. (Brookhaven National Lab., Upton, NY (US)); Zemanian, T. v.v of Corrosion '85. National Assoc. of Corrosion Engineers, Houston, TX (1985). (CONF-850311–: National Association of Corrosion Engineers annual meeting and materials performance and corrosion show, Boston, MA, USA, 25-29 Mar 1985).

The effect of transient heat treatment on throughwall residual stress distribution of cold worked Alloy 600 tubes has been investigated, using electrochemical machining coupled with Sachs analyses for residual stress calculations. Heating for 60 to 150 seconds at 775-850 C causes significant reduction of the magnitude of the stress, and modification of the stress distribution, and thus improves resistance to stress corrosion cracking.

36593 Stress corrosion cracking susceptibility of types 316NG and 316 stainless steel in BWR-type environments. Maiya, P.S. (Argonne National Lab., Argonne, IL (US)); Shack, W.J. v.v of Corrosion '85. National Assoc. of Corrosion Engineers, Houston, TX (1985). (CONF-850311–: National Association of Corrosion Engineers annual meeting and materials performance and corrosion show, Boston, MA, USA, 25-29 Mar 1985).

The relative stress corrosion cracking (SCC) susceptibility of Types 316NG and 316 stainless steel has been investigated by means of constant extension rate tests over a range of strain rate in simulated BWR environments that contain impurities. The impurity and strain-rate effects are discussed in terms of a phenomenological model.

36594 Effect of temperature and ionic impurities at very low concentrations on stress corrosion cracking of sensitized type 304 stainless steel. Kassner, T.F. (Argonne National Lab., Argonne, IL (US)); Ruther, W.E.; Soppet, K. v.v of Corrosion '85. National Assoc. of Corrosion Engineers, Houston, TX (1985). (CONF-850311–: National Association of Corrosion Engineers annual meeting and materials performance and corrosion show, Boston, MA, USA, 25-29 Mar 1985).

Effect of temperature on the SCC behavior of lightly sensitized Type 304 SS was investigated in CERT experiments over the temperature range of 110 to 320 C in high-purity water and in water containing 0.1 and 1.0 ppm sulfate at a dissolved oxygen concentration of 0.2 ppm. The SCC behavior was correlated with the impurity concentration and the open-circuit corrosion potential of the steel.

36595 Atmospheric corrosion and inhibition of copper. Sorensen, N.R. (Sandia National Labs., Albuquerque, NM (US)); Christensen, T.M. v.v of Proceedings of the Electrochemical Society fall meeting. Volume 88-2 (extended abstracts). The Electrochemical Society, Pennington, NJ (1988). (CONF-881061–: Electrochemical Society fall meeting, Chicago, Illinois, USA, 9-14 Oct 1988).

Copper, used extensively in the microelectronics industry, is subject to atmospheric corrosion and tarnishing. Such corrosion can lead to increased contact resistance, open circuits, problems in soldering processes, and additional cleaning cycles during processing. Inhibitors are used routinely to maintain a metallic, untarnished appearance on the copper. A number of organic compounds have been used as corrosion inhibitors for copper in aqueous and atmospheric exposures with varying degrees of success. Two that appear to be particularly effective for copper are benzotriazole (BTA) and tolyltriazole (TTA), which significantly decrease the copper dissolution rate in aqueous environments. The authors are investigating the mechanism by which these organic inhibitors limit oxidation, the effect of atmospheric pollutants (NO_2, H_2S, SO_2, and H_2O) on the inhibition efficiency, and the effects of the inhibitors on manufacturing processes such as soldering. Atmospheric exposures are being run in our Facility for Atmospheric Corrosion testing (FACT) which allows control of the contaminant gasses to concentrations ranging from several ppb to several ppm. Work on Cu inhibition by organic inhibitors (benzotriazole, BTA) has led to the development of a model that describes both the inhibition results and the solderability data following the application of the inhibitor.

36596 The preparation of mechanically alloyed powders for TEM examination. Kamenetzky, E.A. (Materials and Chemical Sciences Div., Lawrence Berkeley Lab., Univ. of California, Berkeley, CA (US)); Wall, M.; Castro, R; Tanner, L.E. v.v of Specimen preparation for transmission electron microscopy of materials. Bravman, J.C.; Anderson, R.M.; McDonald, M.L. Materials Research Society, Pittsburgh, PA (1988). (CONF-871297–: Symposium on specimen preparation for transmission electron microscopy of materials, Boston, Massachusetts, USA, 3 Dec 1987).

TEM specimens of mechanically alloyed elemental Ni and Nb powders are prepared by a new procedure. The alloyed powders are mixed with smaller Al powders and fill an aluminum ring (3mm outer diameter). This composite is cold pressed together with the Al powders taking most of the deformation. The compacted specimen can be mechanically thinned. Electropolishing and ion milling can then proceed by standard methods with special precautions to minimize differential polishing or milling rates. The microstructural aspects of the formation of an amorphous phase by high-energy ball milling these powders have been studied. After 6 h each particle transforms to a heterogeneous layered composite of particles of one element in the matrix of the other. Particle size ranges from 15 nm to 90 nm. Mechanical alloying for 36 h results in the formation of an apparently uniform phase interspersed with a few small (4 nm to 30 nm) elemental crystalline particles. The uniformity of composition and the presence of C, O, and Fe were studied by EDX and EELS.

36597 The failure of aluminum compact shear specimens under mixed-mode loading. Riddle, R.A. (Lawrence Livermore National Lab., Livermore, CA (US)); Streit, R.D.; Finnie, I. v.v of Proceedings of the eighteenth national symposium on fracture mechanics. Read, D.T.; Reed, R.P. ASTM, Philadelphia, PA (1988). (CONF-850679–: 18. American Society for Testing and Materials national symposium on fracture mechanics, Boulder, Colorado, USA, 25-27 Jun 1985).

The failure behavior of 7075-T6 aluminum under mixed-mode loading was investigated using the compact shear specimen. This specimen is capable of providing a range of Mode I and Mode II loading conditions at the crack tip, depending upon the boundary conditions provided by the loading fixtures. Finite-element analyses of the specimen were made which included the effects of loading fixture constraints and the material's elastic-plastic properties. The symmetric and antisymmetric components of the stress and deformation fields were used to calculate the applied J-integral values, J_I and J_{II}, corresponding to the Mode I and Mode II loading at the crack tip. Methods to obtain the critical values of the J-integral at crack initiation from the load displacement curves of the specimen are discussed. The failure behavior of the material varied greatly depending upon the relative amounts of Mode I and Mode II loading at the crack tip. For near Mode I loading, the specimen behavior at failure loads was nearly elastic, and the failure processes appeared to be typical of those for Mode I plane-strain fracture toughness testing. A fairly significant amount of shear loading seemed to have little effect on the failure load. For near Mode II loading, the amount of plastic deformation is much more significant, with the ligament

ahead of the crack tip nearly fully plastic at the failure load. The failure processes in the material, as evidenced by the fracture surface morphology, are different as compared to Mode I type failure. There is evidence of slow stable crack growth occurring at loads near the departure from linearity of the specimen load-displacement curve.

36598 Developments in the TEM examination of Pu and Pu alloys. Zocco, T.G. (Materials Science and Technology Div., Los Alamos National Lab., Los Alamos, NM (US)); Rohr, D.C. v.v of Specimen preparation for transmission electron microscopy of materials. Bravman, J.C.; Anderson, R.M.; McDonald, M.L. Materials Research Society, Pittsburgh, PA (1988). (CONF-871297–: Symposium on specimen preparation for transmission electron microscopy of materials, Boston, Massachusetts, USA, 3 Dec 1987).

Microstructural characterization of plutonium utilizing Transmission Electron Microscopy (TEM) has previously been difficult because of the extreme toxicity and high oxidation rate of plutonium metal. Recent developments in plutonium sample preparation have shown that foils of both alpha and delta phases of plutonium may be prepared for TEM without the use of inert atmospheric systems or complex preparation devices. Samples may be produced, using standard electropolishing techniques, that yield important microstructural data on plutonium and plutonium alloys.

36599 Preparation of in situ Cu-Nb composite sheet and wire for TEM analysis. Trybus, C.L. (Ames Lab., USDOE, Iowa State Univ., Ames, IA (US)); Laabs, F.C.; Spitzig, W.A.; Pelton, A.R. v.v of Specimen preparation for transmission electron microscopy of materials. Bravman, J.C.; Anderson, R.M.; McDonald, M.L. Materials Research Society, Pittsburgh, PA (1988). (CONF-871297–: Symposium on specimen preparation for transmission electron microscopy of materials, Boston, Massachusetts, USA, 3 Dec 1987).

Cu-Nb in situ composites attain anomolous increases in strength upon mechanical deformation. The unique filamentary microstructures that evolve during processing (cold rolling and/or wire drawing) are the source of the strengthening. Results from transmission electron microscopy characterization studies have played a key role in the understanding of the relationships between structure and properties. However, the fabrication of reliable TEM samples has been extremely challenging for the following reasons: traditional electrochemical techniques are not suitable for the two-phase microstructure, preparation of longitudinal and transverse sections of fine (–150 μm diameter wires) and thin (–60 μm thick) sheet is tedious, and it is necessary to avoid excessive heat (< 30^0C) during sample preparation to preserve the metastable structural arrangements. This paper reviews the procedures used to prepare TEM specimens from bulk wire and sheet samples as well as from extracted Nb filaments. Proper techniques for plating, mounting, sectioning, polishing, and ion-thinning are discussed.

36600 Preparation of thin-foil TEM specimens from submillimeter particulate. Kelly, T.F. (Dept. of Metallurgical and Mineral Engineering, Univ. of Wisconsin, Madison, WI (US)); Libera, M.R.; VanDerSande, J.B. v.v of Specimen preparation for transmission electron microscopy of materials. Bravman, J.C.; Anderson, R.M.; McDonald, M.L. Materials Research Society, Pittsburgh, PA (1988). (CONF-871297–: Symposium on specimen preparation for transmission electron microscopy of materials, Boston, Massachusetts, USA, 3 Dec 1987).

The particulate produced by many of the methods of rapid solidification, such as atomized powder, is of order 50 microns in diameter and is thus much too small to form the 3mm diameter disc conventionally used for thin-foil microscopy. 50 microns is, however, much too thick for direct TEM study on a support film and grid. A technique is described in detail that produces a composite wafer where atomized metal powder is sandwiched between two layers of electroplated nickel. This wafer is about 25 mm in diameter and about 250 microns thick. 3mm diameter TEM discs can be punched from the wafer and thinned by combinations of grinding, dimpling, jet-polishing, and ion milling. Depending on the composition and structure of the power under study, the composite nature of the wafer can sometimes promote undesirable galvanic effects during jet polishing and differential thinning rates during ion-milling. Typical results are presented and discussion of the benefits and shortcomings of this technique is made. The method should be applicable to a variety of materials and geometries.

36601 Evaluating the intergranular SCC resistance of sensitized Type 304 stainless steel in low-temperature water environments. Bruemmer, S.M. (Battelle Pacific Northwest Lab., Richland, WA (US)); Jones, R.H.; Divine, J.R.; Johnson, A.B. Jr. v.v of Environment-sensitive fracture: Evaluation and comparison of test methods. Dean, S.W.; Pugh, E.N.; Ugiansky, G.M. ASTM, Philadelphia, PA (1984). (CONF-820495–: ASTM symposium on environment sensitive fracture: evaluation and comparison of test methods, Gaithersburg, MD, USA, 25-28 Apr 1982).

The resistance of sensitized AISI Type 304 stainless steel to intergranular stress corrosion cracking (IGSCC) in 32^0C water environments has been investigated by using constant axial load (CAL), constant extension rate (CER), U-bend, and crevice corrosion tests. Constant load tests were found to give a better simulation of a service failure and produced IGSCC under a wider range of conditions than CER or U-bend tests. Intergranular SCC of welded and furnace-sensitized Type 304 specimens was observed in CAL experiments in both deionized and borated water with ppm level chloride additions. Constant extension rate tests also produced IGSCC, but only in welded pipe specimens with the original ground and welded surfaces intact. If the original inner diameter and outer diameter surfaces were removed, fracture surfaces showed ductile, microvoid coalescence appearances. No evidence of SCC or significant corrosive attack was found in U-bend or crevice corrosion tests after more than six months in dilute chloride environments at temperatures of 30 or 50^0C. However, intergranular cracking was observed in furnace-sensitized, high-carbon Type 304 U-bend specimens at 80^0C.

36602 Specimen thickness effects for elastic-plastic CTOD toughness of an A36 steel. Wellman, G.W. (Sandia National Labs., Albuquerque, NM (US)); Sorem, W.A.; Dodd, R.H. Jr.; Rolfe, S.T. v.v of Proceedings of the eighteenth national symposium on fracture mechanics. Read, D.T.; Reed, R.P. ASTM, Philadelphia, PA (1988). (CONF-850679–: 18. American Society for Testing and Materials national symposium on fracture mechanics, Boulder, Colorado, USA, 25-27 Jun 1985).

This paper describes the results of an experimental and analytical study of the effect of specimen size on the fracture toughness behavior of A36 steel, primarily in the lower-transition region. This region is beyond the limits of plane strain as defined by ASTM Method E 399, but in the region where failure occurs prior to any macroscopic fibrous tearing. Experimental results were obtained using crack-tip opening displacement (CTOD) three-point bend specimens, and analytical results were obtained using a 3-D elastic-plastic finite-element analysis. Two specimen sizes, full thickness [31.8 mm (1.25 in.)] and reduced thickness [12.7 mm (0.50 in.)], were investigated using the preferred t x 2t x 8t specimen size. Testing was conducted according to the procedure outlined in BS 5672: 1979, Methods for Crack Opening Displacement Testing. CTOD-temperature transition curves were developed for both specimen sizes. A sufficient number of specimens were tested at two temperatures in the lower-transition region to allow statistical characterization of the CTOD results. Both normal and Weibull distributions were used for that characterization. Three-dimensional elastic-plastic finite-element analyses were conducted to determine the effect of specimen size on the near-crack-tip opening stresses through the specimen thickness. The near-crack-tip stress fields were compared at various CTOD levels well into the elastic-plastic regime, but prior to any stable crack growth. At each of the applied CTOD levels, the maximum near-crack-tip opening stress occurred at the specimen centerplane and was found to be essentially independent of specimen size.

36603 Theoretical investigations of phonon anomalies in fcc La and W(001). Wang, X. Thesis (Ph. D.). 85p. Iowa State Univ., Ames, IA (1987). Available from University Microfilms, PO Box 1764, Ann Arbor, MI 48106, Order No.88-05,150.

Studies of the electron-phonon interaction were carried out for fcc La by the efficient tight-binding method. This scheme was then extended and generalized to surface studies. Application of this extended scheme to the W(001) surface provided detailed information about the driving mechanism for surface reconstruction. Together with the further studies on the Mo(001) surface, the investigation

showed very promising potential applications of this scheme to various surface phonon and surface phase-transition studies. For the fcc La, first-principles pseudopotential band-structure calculations were performed and revealed a small but sharp nesting feature of the Fermi surface. The calculations for W(001) p (1x1) surface phonons successfully demonstrated the electronic origin of the c(2x2) surface reconstruction. The reason for the stable M_1 and soft M_5 surface-phonon modes was found to be the dramatic differences in their electron-phonon coupling matrix elements. The subtle interplay between the Fermi surface nesting and real-space d-orbital interaction was found to cause the surface reconstruction. Subsequent studies on the Mo(001) surface further established the relationship between these competing effects and surface reconstruction geometries.

36604 Optical properties of metals and alloys: Au, Ag, FeRh, $AuAl_2$, and $PtAl_2$. Chen, L.Y. Thesis (Ph. D.). 127p. Iowa State Univ., Ames, IA (1987). Available from University Microfilms, PO Box 1764, Ann Arbor, MI 48106, Order No.88-05,054.

The free-electron dielectric functions of Ag and Au films were measured in air and immersed in dielectric liquids of different refractive indices. Measurements of the dielectric functions for FeRh alloys with 48, 50, 52, and 54% Fe concentrations were measured between 25 and 125°C in the 1-3-eV range. Results show that the band structure of FeRh is not drastically affected at the antiferromagnetic (AF) - ferromagnetic (F) phase transition, less than band-structure calculations indicated. Therefore, the large change in the electronic specific heat between the AF and F phases can be attributed primarily to a magnetic contribution rather than to a change in the density of electronic states at the Fermi surface. Finally, dielectric functions of $AuAl_2$ and $PtAl_2$ alloys were measured in the 1.5-5.5-eV range. The spectra of reflectivity, absorption, energy loss function, and joint density of states were obtained and are discussed in detail. The onsets of interband transitions were determined by last-squares fitting to the absorption edges in the spectra of the joint density of states, which could be attributed to transitions between only the s and p bands for both materials.

36605 Developments and trends in electrodeposition. Dini, J.W. (Lawrence Livermore National Lab., CA (USA)). *SAMPE (Society for the Advancement of Material and Process Engineers) Quarterly (USA),* 20(3): 28-32 (Apr 1989). DOE Contract W-7405-ENG-48.

Electrodeposition is a very important technology. Covering inexpensive and widely available base materials with a thin (typically 0.1 to 10 μm) coating with specific properties extends their use to applications which otherwise would have been prohibitively expensive. Furthermore, the ability to provide property control in coatings as thick as 10 mm adds further value to this important technique of surface modification. In recent years a number of advances in areas such as composite plating, pulse plating and high speed plating have added further credence viable coating technology. These branches of the industry are reviewed and future trends are discussed.

36606 Ion-beam studies of hydrogen-metal interactions. Myers, S.M. (Sandia National Labs., Livermore, CA (USA)); Richards, P.M.; Wampler, W.R.; Besenbacher, F. *Journal of Nuclear Materials, on Metallurgy, Ceramics and Solid State Physics in the Nuclear Energy Industry (Netherlands),* 165(1): 9-64 (Apr 1989). DOE Contract AC04-76DP00789.

Experiments utilizing ion implantation and ion-beam analysis have provided a large body of new quantitative information on hydrogen interactions within metal matrices and at metal surfaces. Investigated matrix interactions include trapping by vacancies, vacancy-solute complexes, He bubbles, and oxide precipitates, together with such phase-change reactions as hydride formation, hydrogen-bubble precipitation, and hydrogen reduction of precipitated oxides. Extracted information encompasses mechanisms, binding enthalpies, microstructures, and local atomic configurations. In the area of surfaces, ion-channeling analysis has yielded the lattice positions of chemisorbed hydrogen on a variety of metals. Additionally, ion-implantation experiments have quantified surface-limited uptake and release for bare, chemisorbed, and oxidized metal surfaces. Theoretical studies coupled with the ion-beam experiments have produced advances in four areas of hydrogen behavior. First, effective-medium theory has been shown to yield a quantitative description of hydrogen energies and positions at matrix defect traps and surface chemisorption sites. Second, a new, analytical treatment of trapping kinetics gives quantitative trapping rates for arbitrary trap volume fraction and arbitrary spatial correlation between traps. Third, new theoretical studies of surface barriers have clarified the dominant processes of release for bare, chemisorbed, and oxidized metal surfaces. Finally, general transport formalisms have been developed to predict overall hydrogen behavior in terms of individual matrix and surface processes.

36607 Effect of Y_2O_3 additions on the plasticity of sintered Cr_2O_3. King, W.E. (Argonne National Lab., IL (USA)); Park, J.H.; Routbort, J.L.; Goretta, K.C. *Oxidation of Metals (USA),* 29(3-4): 217-224 (Apr 1988).

The authors have carried their constant strain-rate compression tests on polycrystalline Cr_2O_3 and Cr_2O_3 doped with 0.09 wt.% Y_2O_3 to establish whether there exists an effect of Y_2O_3 on the plasticity of Cr_2O_3. This study is motivated by previous work on the oxidation of alloys containing reactive-element additions. In that work, it has been observed that the addition of oxygen-active elements, such as Y to alloys that form Cr_2O_3 or Al_2O_3 oxide layers upon exposure at high temperature, strongly enhances the adhesion of the oxide layer to the base alloy as compared with alloys without reactive-element additions. They have found that at 1200°C (1) chromia exhibits limited plasticity at high temperatures, and (2) the presence of Y in the oxides does not enhance plasticity compared with addition-free oxides.

36608 Effect of chromium on early stages of oxidation of Ni_3Al alloys at 600°C. Horton, J.A. (Oak Ridge National Lab., TN (USA)); Cathcart, J.V.; Liu, C.T. *Oxidation of Metals (USA),* 29(3-4): 347-366 (Apr 1988).

Initial oxide formation at 600°C in air on Ni_3Al alloys with and without chromium additions was studied by TEM. Significant lateral nickel diffusion (apparently stress-induced) occurred in both alloys producing bands of nickel and nickel-enriched hillocks. Chromium additions clearly alleviate dynamic embrittlement in Ni_3Al; chromium additions were previously assumed to affect the oxidation process. Chromium additions significantly reduced the oxidation rate of the alloy. However, a continuous film of pure Cr_2O_3 had not yet formed after 45 sec oxidation. Grain boundaries preferentially oxidized to form Al_2O_3 or Cr_2O_3 and rejected nickel along both the surface and the grain boundary, deeper into the specimen. The dramatic effect of chromium on improving the ductility of Ni_3Al when tested at high temperature in air is apparently a result of a process that occurs at or near the tip of a propagating crack that is both faster and on a finer scale than that studied here.

3602 Ceramics, Cermets, and Refractories

36609 (AD-A-201483/5/XAB) **Josephson effect research in high-temperature superconductors. Interim report, 30 September 1987-29 September 1988.** Cheng, J.T.; Wenger, L.E. Wayne State Univ., Detroit, MI (USA). Aug 1988. 35p. Available from NTIS, PC A03/MF A01.

The original research proposal to ONR/SDIO had outlined two major goals to be accomplished during the three and half year period from July 1987 to December 1990. The first task was fabrication and characterization of thin-film superconductors with the high-temperature oxide materials; and the second was fabrication and characterization of Josephson tunnel junctions. These tasks included the following: (i) fabrication and characterization of thin film superconductors and (ii) fabrication and characterization of Josephson tunnel junctions. Although the administration/contracting of funds was not formally authorized until January 1988, the progress was quite successful with regards to the first goal of fabrication and characterization of thin/film superconducting oxide films. Similar to all other research groups in being unable to fabricate simple

Josephson tunnel junctions with superconducting oxides, the authors have, however, been unable to initiate some characterization of the electromagnetic response observed in these films due to the inherent granular Josephson-coupled networks. Progress attained in the research proposal to date, a summary of the major accomplishments, and index of publications attributable to the present funding period are outlined, along with the proposed program for continued research.

36610 (AD-A–204630/8/XAB) **Phase relationships in high-temperature ceramics. Phase 1. Final report.** Turcotte, R.P. Flow Research Co., South Kent, WA (USA). Apr 1987. 39p. (FLOW-TR–409). Available from NTIS, PC A03/MF A01.

The objective of this work was to establish an efficient means of determining the high temperature phase behavior of the HfO_2-Ta_2O_5 system under conditions of relevance to their potential use in propulsion system environments. A primary objective was to establish melting temperatures for the mixed oxides and to identify phases formed in the high temperature portions of the phase diagram, above 2500 F (1400 C). The approaches evaluated included traditional anneal quench studies and use of CO_2 laser heating in controlled atmospheres. Melting points were measured using an optical pyrometer/laser fusion approach. Phases formed were characterized primarily by x-ray diffraction and electron microscopy. the liquidous curve for the oxide system has been established and two new phases identified for the oxide system.

36611 (AD-A–204648/0/XAB) **Consolidation of powders of the oxide superconductor YBa_2Cu_3Ox by high energy-high rate processing.** Persad, C.; Lee, S.J.; Peterson, D.R.; Swinnea, J.S.; Schmerling, M. Texas Univ., Austin, TX (USA). 1988. 10p. Available from NTIS, PC A02/MF A01.

Pub. in World Scientific Series on Progress in High Temperature Superconductivity, Vol. 8, 460-475(1988).

The consolidation response of powders of the superconducting compound YBa_2Cu_3Ox is reported. Copper, silver, tin, and Cu-based metallic glass infiltrates have also been employed in preliminary fabricability studies. The processing approach relies on short-duration (< 1s), high-current-density 10000 A/sq.cm, pulse-resistive heating of powders under applied pressures of 200 MPa to 400 MPa. Powders and fabricated disk compacts were characterized by X-ray diffraction, optical and scanning electron microscopy, and resistivity measurements. X-ray diffraction comparisons of starting powder and consolidated material show retention of the single phase 1-2-3 structure and the development of a preferred orientation. In the consolidated pure YBa_2Cu_3Ox, Tc onsets of 87K were accompanied by broad transitions. Iodometric analyses indicated oxygen depletion in the as-consolidated disks. Observed oxygen-content profiles across the sample thickness had values $0.11 < x < 0.35$. The variation in the peak processing temperature within the disk was found to correlate with the oxygen content profile.

36612 (AD-A–204687/8/XAB) **Transformation toughening of ceramics. Final report, 1 September 1985-31 August 1988.** Marshall, D.B. Rockwell International Corp., Thousand Oaks, CA (USA). Science Center. Dec 1988. 101p. (SC–5444.FR). Available from NTIS, PC A06/MF A01.

The results of a three-year study, aimed at understanding factors that dictate microstructural evolution and mechanical properties of transformation toughened ceramics, are summarized. Large crack-growth resistance curves (rather than single-valued toughness) were discovered in toughened zirconia, and these were shown to be responsible for strength-toughness relations, damage tolerance, and other mechanical properties. New insight was gained into mechanisms of controlling grain growth during processing, and a method for forming high strength, fine-grained ZrO_2 fibers was discovered. In the final year's work, reported in detail here, a new tetragonal-to-orthorhomic phase transformation at low temperatures was discovered and shown to have a dramatic effect on mechanical properties. New methods were applied to measure the amount and location of phase transformation within crack tip zones and to quantify crack tip shielding, evaluate stability and reversibility of the martensitic transformation, and to determine the net transformation strain that gives to toughening. Finally, crack growth under cyclic loading was demonstrated to be important in zirconia materials.

36613 (AD-A–205013/6/XAB) **High-temperature superconductivity. Quarterly report No. 1 for period ending FY89.** Eckstein, J.N. Varian Associates, Inc., Palo Alto, CA (USA). Varian Research Center. 9 Jan 1989. 9p. Available from NTIS, PC A02/MF A01.

The goals of this program are to develop the technology of molecular beam epitaxy to growth of high-temperature superconductor material, to optimize the performance of HTSC films with high transition temperatures and critical densities, and to explore the development of electronic devices based on such material. Both fundamental and practical issues are studied which are involved in the heteroepitaxial in-situ growth of copper-containing layered perovskite compounds. This included continued analysis of previously grown films. A significant insight into the MBE growth process was obtained by detailed study of lattice image transmission electron microscopy of one of our earlier as-grown superconducting films of Dy-Ba-Cu-O. In particular, the interplay between kinetic control and the tendency toward thermodynamic equilibrium was evident. This has led to important insights in understanding the process by which layered, superlattice-like structures in these systems can be grown. The aim is to use kinetic control available in MBE from beam shutters and stable sources to atomically layer the superlattice-like structure of extended unit cell HTSC compounds. Active sources of oxygen are employed to ensure the completion of at least the necessary degree of oxidation and the beams of the constituents are turned on and off using mechanical shutters to layer the constituent species and to provide kinetic control of the growth process.

36614 (AERE-R–13232) **Compressive creep in nuclear oxides.** Hough, A. UKAEA Harwell Lab. (UK). Chemistry Div. Aug 1988. 107p. (FRFF/P–88-40;AGT–010101/P7). Available from H.M. Stationery Office, London, price Pound 18.75.

Results are reported of compressive creep tests on uranium dioxide and uranium/plutonium mixed oxides. The deformation rates of the various oxides have been measured as functions of stress, temperature, density, grain size, oxygen/metal ratio. The effect of the addition of other oxides (TiO_2 and ZrO_2) and of simulated fission products has been studied. In general the creep rate for all the compositions studied shows a roughly linear dependence on stress at low stresses, with a diffusion controlled mechanism. Some samples show a threshold stress below which the creep rate is much reduced. At high stresses, where the creep is due to dislocation movement, the creep rate depends on a higher power (4-6) of the stress. The behaviour in these two regions and the changes in the transition stress which mark the boundary between them, are discussed.

36615 (CONF-890426–21) **Evidence for phonon-mediated coupling in superconducting $Ba_{0.6}K_{0.4}BiO_3$.** Hinks, D.G.; Dabrowski, B.; Richards, D.R.; Jorgensen, J.D.; Pei, Shiyou; Zasadzinski, J.F. Argonne National Lab., IL (USA). 1989. 12p. Sponsored by DOE Energy Research. DOE Contract W-31109-ENG-38. From Spring meeting of the Materials Research Society; San Diego, California, USA; 24-28 Apr 1989. Order Number DE89014642/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Superconducting $Ba_{0.6}K_{0.4}BiO_3$, with a T_c of 30K, shows a large ^{18}O isotope effect which indicates that phonons are involved in the pairing mechanism. Infrared reflectivity measurements indicate a value for the superconducting gap consistent with moderate coupling ($2\Delta/kT_c = 3.5 \pm 0.5$). A mediating energy for pairing of about 40 MeV would be required to obtain a T_c of 30K. Strong coupling of electrons by optical phonons (which are present in this material with energies up to 80 MeV) could account for the observed transition temperature. Recent tunneling spectroscopy shows the presence of strongly coupled optical phonons in the 40 to 70 MeV region, indicating that superconductivity in this material may be phonon mediated. 8 refs., 11 figs.

36616 (CONF-890754–1) **Thermal conductivity anisotropy in single crystal $YBa_2Cu_3O_{7-x}$.** Rosencwaig, A.; Opsal, J.; Willenborg, D.L.; Coufal, H. Therma-Wave, Inc., Fremont, CA (USA). 1989. 3p. Sponsored by DOE Energy Research. DOE Contract AC03-88ER80652. From 6. international topical meeting on photoacoustic and photothermal phenomena; Baltimore, Maryland, USA; 31 Jul - 3 aug 1989. Order Number DE89009643/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We have used the modulated reflectance thermal wave technique to measure the crystallographic anisotropy in the room temperature thermal conductivity of single crystals of $YBa_2Cu_3O_{7-x}$. 7 refs.

36617 (CONF-8906147–1) **Noncontacting laser diffraction strain extensometer for material properties characterization at high temperatures.** Liu, K.C.; Pih, H. Oak Ridge National Lab., TN (USA). 1989. 6p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. From International congress on technology and technology exchange; New York, NY, USA; 28-30 Jun 1989. Order Number DE89013551/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A noncontacting optical system, utilizing the interference fringes produced by the diffraction of laser light passing through a narrow slit, has been developed for measuring static and dynamic strain deformations at elevated temperatures above 1300°C. Basic optical theory, details of instrumentation, system operation, and sample applications are presented. Examples utilizing SiN and Ti alloy composite are given. 4 refs., 11 figs.

36618 (CONF-8906155–1) **The amorphous to gamma transformation in ion implanted Al_2O_3.** Sklad, P.S.; McCallum, J.C.; McHargue, C.J.; White, C.W. Oak Ridge National Lab., TN (USA). 1989. 14p. Sponsored by DOE Energy Research. DOE Contract AC05-84OR21400. From Radiation effects in insulators-5: crystalline oxides and ceramics session; Hamilton, Canada; 19-23 Jun 1989. Order Number DE89014797/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Amorphous surface layers, free of implanted impurities, were produced on single crystal α-Al_2O_3 substrates by implantation at −185°C with 2×10^{16} Al/cm^2 at 90 keV and 3×10^{16} O/cm^2 at 55 keV. The response of these amorphous layers to post-implantation annealing in the temperature range from 700°C to 800°C was investigated by in situ transmission electron microscopy (TEM) and conventional TEM of specimens annealed in bulk form. It was found that the amorphous Al_2O_3 transformed to the transitional γ phase along an irregular front. The recrystallized material is columnar with the individual columns or domains irregular in size and shape. The γ-Al_2O_3 is composed of two variants which are twin related and have the following orientation relationship with the substrate: $<110>\gamma$ //$<10\bar{1}0>\alpha$ and $\{111\}\gamma$ //$\{0001\}\alpha$. The temperature-dependence velocity of the amorphous-to-γ transformation front was measured by in situ TEM. Assuming a thermally activated process, the activation energy has been determined from an Arrhenius plot of velocity versus T^{-1}. These results are discussed in terms of possible rate controlling processes of the transformation. 8 refs., 3 figs.

36619 Interfaces and toughening in ceramics. Marshall, D.B. (Rockwell International Science Center, Thousand Oaks, CA (USA)). pp. 9 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Fracture mechanics modelling has recently provided insight into the role of interfaces in toughening of ceramics and ceramic composites by reinforcements that form crack bridging ligaments. Some results of the modelling are summarized and an indentation method is described for measuring interfacial mechanical properties (debond energy, frictional sliding resistance, and residual stresses) at individual fibers in composites with weak interfacial bonding between the fibers and matrix.

36620 Understanding oxide-metal interfaces. Stoneham, A.M. (Theoretical Physics Div., Oxfordshire (England)); Tasker, P.W. pp. 16 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

One of the most important features of the interface between an oxide and a metal is the sharp change in dielectric constant between the two materials. This suggests that the stabilization of charges (lattice ions and defect centers) in the non-metal by the polarization of the metal may contribute strongly to the interfacial adhesion. This effect can be treated in classical electrostatics by the method of images. The authors present the application of this theory to the adhesion of bulk materials and to the properties of thin films and coatings. The predictions of the continuum theory are compared with atomistic calculations of interfaces. Finally, they consider how, in light of this theory, how interfacial adhesion can be influenced and controlled.

36621 Study of long range forces in epitaxy systems: the Ag/Si interface. Shirokoff, J. (Queen's Univ., Kingston, Ontario (Canada)); Hui, K.C.; Erb, U. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The Ag/SiO_x/Si interfacial system is investigated to observe orientation relationships of low energy. For this purpose the orientation distribution of small silver particles on (100) silion substrates was measured after annealing at 700°C. Three orientation relationships resulting in interfaces of low energy were observed, representing cusps in the interfacial energy versus misorientation curve. Two of these preferred orientations are orientations for which close packed and second close packed planes of the silver phase are parallel to the surface, while the third orientation is epitaxial. The epitaxial orientation was found to occur even when an amorphous SiO_x interlayer of about 180 Å separated the Ag particles from the Si substrate. The influence of long range ordering effects are discussed.

36622 Contribution of lattice matching to the interfacial energy between dissimilar materials. Fecht, H.J. (Univ. of Wisconsin, Madison (USA)). pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The interfacial energy of boundaries between dissimilar materials can be described as function of the lattice mismatch, the chemical interaction and the interfacial entropy of the boundaries. Based on experiments involving a sphere-rotation method and undercooling measurements of (solid/liquid) phase mixtures in a droplet dispersion, an attempt is made to separate the influence of the different contributions. The atomic structure of interphase boundaries between noble metals and ionic crystals can be described by the lock-in model: low energy interphase boundaries were found if close packed rows of atoms at the surface of the metal crystal lock into the valleys between close packed rows of atoms at the surface of the ionic crystal. At higher temperatures the relative stability of different interphase boundary structures may change depending on the degree of axial commensuration and the related interfacial entropies. Hence, the contribution of lattice matching to the interfacial energy can decrease or vanish completely in some cases, resulting in a commensurate/incommensurate phase transition (e.g. for Au/Al_2O_3). Furthermore, the droplet undercooling experiments demonstrate that good matching between two crystal lattices (substrate/nucleus) can favor formation of metastable phases due to the lowering of the activation barrier for nucleation during crystallization from a highly undercooled liquid.

36623 High resolution electron microscopy of interfaces in functional materials. Ishida, Y. (Univ. of Tokyo (Japan)); Ichinose, H.; Takahashi, Y. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The authors recent high resolution electron microscopic observation of various interfaces in functional materials such as semiconductor superlattice, superconducting perovskite ceramic, new engineering ceramics, fiber reinforced metal and ceramic-metal joining suggested that the traditional unified view of the interface structure in a number of directions taking into account the chemistry, polytype structures, thickness, bonding heterogenity etc to make the structural theory useful for the future design of the interfaces in modern functional materials.

36624 HVEM and HREM of interfaces in aluminum nitride ceramics. Hagege, S. (Univ. of Tokyo (Japan)); Ishida, Y.; Tanaka, S.

pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793--: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Impurities in the wurtzite structure of aluminum nitride (AlN 2H) ceramics are accommodated by a pair of very particular interfaces. An analysis of their structure has been performed using high voltage and high resolution TEM which allowed them to propose a geometrical description of the defect. The main features of the microstructure of this material and its relevant interfaces are also reported.

36625 Diffusion reactions between silicon oxynitride and silicon nitride during HIP-synthesis. Larker, R. (Lulea Univ. of Technology (Sweden)); Loberg, B. pp. 8 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793--: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Recent advances in production processes for High Performance Ceramics have made it possible to produce fully dense net shape turbocharger and gas turbine rotors made of silicon nitride. These rotors must usually be attached to a metal shaft by some joining technique. Solid state bonding by diffusion reactions is an attractive route to achieve joints that retain strength at high temperature. Intimate physical contact across the joint during bonding is important for the diffusion process. Hot Isostatic Pressing (HIP) can enhance the contact and thus produce a stronger joint at a lower bonding temperature than other methods. Silicon oxynitride synthesized from a stoichiometric mixture of silicon nitride and silicon oxide by HIP has some interesting properties that might be useful as an intermediate layer in bonding silicon nitride to metals. This work is a part of an assessment to develop solid state bonding methods for the joining of silicon nitride to superalloys by HIP. It presents the first steps in the development, namely the optimization of the synthesis of pure silicon oxynitride during densification by HIP and joining of the oxynitride to silicon nitride during synthesis and densification by HIP. The achievements in these areas and the direction of future work will be discussed.

36626 Hetero- and homo-phase boundaries in ceramic oxides. Carter, C.B. (Cornell Univ., Ithaca, NY (USA)); Colgan, E.G.; McKernan, S.; Simpson, Y.K.; Summerfelt, S.R.; Susnitzky, D.W.; Tietz, L.A. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793--: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Interfaces in various ceramic systems which are not based on the rock-salt structure, have been studied and the results are presented together with some models of the interfaces.

36627 Core structure of CSL boundaries in NiO. Merkle, K.L. (Argonne National Lab., IL (USA)); Reddy, J.F.; Wiley, C.L.; Smith, D.J. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). DOE Contract W-31-109-ENG-38. (CONF-870793--: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Atomic resolution electron microscopy is used to study (001) CSL tilt boundaries in NiO. Asymmetric as well as symmetric grain-boundary plane orientations are found in bicrystals grown by the Verneuil technique. The Σ=5, (310) grain boundary is observed to occur in two distinct forms, both of which differ from previously proposed theoretical models. The Σ=13, (510) boundary, in addition to also showing a multiplicity of structures, is not planar on an atomic scale, but includes displacements of structural units normal to the average grain-boundary plane. It is suggested that the reduced atomic density at high-purity ceramic-oxide grain boundaries is not only due to lattice expansion, but is in part due to a high concentration of Schottky pairs in the grain boundary.

36628 Structural analysis and properties of grain boundaries in hexagonal carbides. Vicens, J. (Universite de Caen (France)); Laurent-Pinson, E.; Chermant, J.L.; Nouet, G. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793--: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Grain boundaries in tungsten carbide crystals (hexagonal structure c/a = 0.976) show many coincidence orientations. The most frequent orientation has a coincidence index Σ=2. H.R.E.M. images of such grain boundaries have been realized. These grain boundaries show a defect structure, only due to the mismatch of the a and c parameters. These defects consist of dissociated $1/6(1120)_1$ or $1/2\ (0001)_2$ dislocations regularly spaced. An atomic step is associated with each dislocation. This particular grain boundary can be described as a Σ=2 (c/a = 1) grain boundary with a periodic structure of dislocations or as a Σ=39 (c/a = 0.975) grain boundary with a 1°5 deviation to the exact coincidence orientation.

36629 TEM study of ZrO_2/Al interface. Tremouilles, G. (ETCA, Arcueil (France)); Portier, R. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793--: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Yttria partially stabilized zirconia is coupled to monocrystalline pure aluminum by thermal-compressive process. A good adhesion is obtained, and alumina microcrystals are observed at the interface. The oxygen diffusion from zirconia allows alumina's growth. Preferential orientation relationships exist at this interface.

36630 Phase transformation in boron doped SiC: HREM study of a twin interface. Lancin, M. (CNRS, Meudon (France)); Thibault-Desseaux, J. pp. 8 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793--: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

In the materials studied, the phase transformation $\beta \rightarrow \alpha$ involves the formation of feathers which can be described as penetration twins. In this investigation the structure of a twin interface is studied by high resolution electron microscopy (HREM). The twin studied has a 15R structure and a high angle twin boundary. An attempt is made to explain the formation of such a twin.

36631 Equilibrium crystal shapes and surface phase diagrams at surfaces in ceramics. Handwerker, C.A. (National Bureau of Standards, Gaithersburg, MD (USA)); Vaudin, M.D.; Blendell, J.E. pp. 8 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793--: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The equilibrium shape of a crystal is the shape which minimizes the total surface free energy of the crystal and may contain any or all of the following: facets, sharp edges, smoothly curved surfaces, and corners. The relationship between the surface free energy per unit area, γ, and the equilibrium crystal shape is seen straightforwardly from the Wulff plot, the polar plot of γ as a function of orientation of the normal vectors, n. Cabrera, Cahn, and Rottman and Wortis have described the boundaries between surfaces on the equilibrium crystal (for example, between adjacent facet planes) as surface phase transitions. If γ(n) changes with temperature, pressure, or chemical potentials of the components, the equilibrium shape of the crystal may change. This change in equilibrium shape can be represented by a surface phase diagram with axes of surface orientation, in terms of angle from an arbitrary orientation, and temperature, pressure, or chemical composition. The surface phase transitions of MgO have been determined as a function of NiO solute concentration and surface phase diagrams have been constructed.

36632 Influence of doping elements on the grain boundary characteristics in alumina. Lartigue, S. (Universite Paris-Sud, Orsay (France)); Priester, L. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793--: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The distribution and characteristics of grain boundaries have been determined in pure undoped and Mg-doped aluminas. Mg-doped alumina presents a high proportion of special coincidence boundaries while in pure undoped alumina most of boundaries are general but present densely packed planes. The grain boundary distributions are analyzed in relation with the microstructures of the two materials.

36633 Grain boundary diffusion of Co and Ni in bicrystalline and polycrystalline NiO. Barbier, F. (Universite Paris-Sud, Orsay (France)); Dechamps, M. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Grain boundary diffusion of Co and Ni has been studied in (001) and (011) symmetrical tilt NiO bicrystals. No preferential intergranular diffusion has been detected. It is thought that cation diffusion along grain boundaries is less than 10^3D, where D is the lattice diffusion coefficient, and not of the order of 10^5D as published. Moreover, it is unlikely that impurities are entirely responsible for the discrepancies.

36634 Interfacial characteristics of glass-ceramic matrix/SiC fiber composites. Brennan, J.J. (United Technologies Research Center, Hartford, CT (USA)). pp. 20 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The fiber/matrix interfacial region between lithium aluminosilicate (LAS) glass-ceramic matrices and a variety of SiC and/or Si-C-N-O fibers and whiskers was examined, primarily through the use of the scanning transmission electron microscope (STEM) and the scanning Auger multiprobe (SAM). It was found that the interfacial chemistry varied widely, depending upon the particular fiber or whisker utilized, and that the chemistry of the interface determined to a large degree the resultant mechanical properties of the composite. In general, those composites exhibiting a weakly bonded fiber/matrix interface tended to be strong and tough, while those exhibiting a strongly bonded interface were weak and brittle.

36635 (INIS-BR–1535) **Advanced ceramics in Brazil: actual stage and perspectives.** Zanotto, E.D. Ministerio de Ciencia e Tecnologia, Brasilia, DF (Brazil). Nov 1986. 61p. (In Portuguese). Order Number DE89619612/JAW. Available from NTIS (US Sales Only), PC A04/MF A01 - OSTI; INIS.

The development of advanced ceramics in Brazil, the perspectives of the world and Brazilian markets, the raw materials, the equipments for industry and research, the human resources, and the disposable technology, are presented. The researches on advanced ceramics in Brazil initiated in the sixty decade, with the nuclear fuel development and production projets. (M.C.K.).

36638 (LA–11577-MS) **SiC-$MoSi_2$ composites.** Carter, D.H.; Petrovic, J.J.; Honnell, R.E.; Gibbs, W.S. Los Alamos National Lab., NM (USA). Jun 1989. 11p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract W-7405-ENG-36. Order Number DE89013656/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Previous studies have shown that SiC whisker-reinforced $MoSi_2$ is an excellent candidate material for structural use at elevated temperatures. The yield strength at 1400°C was doubled with the addition of Los Alamos VLS SiC whiskers, and increased by a factor of five with the addition of VS SiC whiskers, despite a non-optimal distribution of the reinforcement resulting from dry blending fabrication procedures. A more optimal wet processing technique, providing a much more uniform distribution of the whisker reinforcement will be discussed. Activities directed at alloying $MoSi_2$ with other silicides to improve the mechanical properties of the matrix material will also be described. 6 refs., 5 figs., 1 tab.

36639 (LA-UR–89-1777) **Barium potassium bismuth oxide: Synthesis and physical properties.** Ott, K.C.; Hundley, M.F.; Kwei, G.H.; Maley, M.P.; McHenry, M.E.; Peterson, E.J.; Thompson, J.D.; Willis, J.O. Los Alamos National Lab., NM (USA). 1989. 12p. Sponsored by DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-890426–23: Spring meeting of the Materials Research Society, San Diego, California, USA, 24-28 Apr 1989). Order Number DE89013458/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A series of compounds $Ba_{1-x}K_xBiO_3$ have been prepared and characterized over the range of compositions ranging from x = 0.3 to 0.5. A neutron powder diffraction analysis has been carried out for the composition x = 0.4 at room temperature and at 10 K. Examination of the superconducting properties as a function of x indicates superconductivity occurs over a narrow range of compositions close to x = 0.4, with T_c of 29 K. Specific heat measurements indicate conventional electron-phonon interactions may play a role in promoting superconductivity in $Ba_{.6}K_{.4}BiO_3$. Magnetization loops and examination of the time dependent magnetization indicate that $Ba_{.6}K_{.4}BiO_3$ has a low value of J_c due to very weak pinning. 18 refs., 6 figs.

36640 (LA-UR–89-2059) **Nuclear relaxation rates at copper and oxygen sites in $YBa_2Cu_3O_7$.** Hammel, P.C.; Takigawa, M.; Heffner, R.H.; Fisk, Z.; Ott, K.C. Los Alamos National Lab., NM (USA). 1989. 3p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890718–5: International conference on materials and mechanisms of superconductivity - high-temperature superconductors, Stanford, California, USA, 23-28 Jul 1989). Order Number DE89014308/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We report NMR measurements of the nuclear relaxation rate at all copper and oxygen sites in magnetically aligned powder samples of $YBa_2Cu_3O_7$. There is no peak in the oxygen relaxation rate below T_c at any oxygen site supporting the possibility that d-wave pairs are formed in the superconducting state. Comparison of the oxygen and copper rates in the planes reveals a characteristic temperature greater than T_c. 6 refs., 2 figs.

36641 (LA-UR–89-2141) **^{17}O NMR study of $YBa_2Cu_3O_{7-\delta}$.** Takigawa, M.; Hammel, P.C.; Heffner, R.H.; Fisk, Z.; Ott, K.C.; Thompson, J.D. Los Alamos National Lab., NM (USA). 1989. 4p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890718–3: International conference on materials and mechanisms of superconductivity - high-temperature superconductors, Stanford, California, USA, 23-28 Jul 1989). Order Number DE89014292/JAW. Available from NTIS, PC A02/MF A01 - OSTI.

We present our ^{17}O NMR experimental results in a magnetically aligned powder sample of $YBa_2Cu_3O_{7-\delta}$ (T_c = 93 K). The sign of the anisotropic Knight Shift shows that the spin density resides mainly on the p_σ orbitals at the planar O(2,3) and bridging O(4)

sites. About 30 % of the total spin susceptibility is attributed to the oxygen $2p_\sigma$ states. The Knight shift at the O(2,3) sites decreases more rapidly than that at the chain O(1) sites, indicating a larger gap in the planes. The nuclear relaxation rate at the O(2,3) sites shows linear-T (Korringa) behavior above T_c, in contrast to the much temperature dependence at the planar Cu(2) sites. However, these two rates show identical temperature dependence below about 110 K, indicating that an important change in the spin dynamics takes place above T_c. 13 refs., 3 figs.

36642 (LA-UR–89-2142) **Anomalous temperature dependence of Cu NMR line width and magnetization in $YBa_2Cu_3O_{7-\delta}$.** Takigawa, Masashi; Hammel, C.P.; Heffner, R.H.; Fisk, Z.; Thompson, J.D.; Maley, M. Los Alamos National Lab., NM (USA). 1989. 2p. Sponsored by DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-890718–4: International conference on materials and mechanisms of superconductivity - high-temperature superconductors, Stanford, California, USA, 23-28 Jul 1989). Order Number DE89014291/JAW. Available from NTIS, PC A02/MF A01 - OSTI.

We report an anomalous temperature dependence of the magnetization and the NMR line width at the planar Cu(2) and oxygen sites in the mixed state of aligned $YBa_2Cu_3O_{7-\delta}$ powder at relatively high field ($\geq$30 kOe), where hysteresis of the magnetization due to flux pinning is not important. Both the magnetization and the NMR line width at all sites show a steep increase at low temperature. We found a much larger line width at Cu(2) sites than at oxygen sites when the magnetic field is applied perpendicular to the c-axis, indicating a very microscopic local field modulation. 4 refs., 2 figs.

36643 (NRCC/IMR–28160) **Plasma spraying of WO/sub3/. Structure characterization of the coating.** Ladouceur, M; Dodelet, J.P.; Parent, L.; Dallaire, S. National Research Council of Canada, Boucherville, PQ (Canada). Industrial Materials Research Inst. [1989]. 25p. (MICROLOG–89-00555). Available from Canada Institute for Scientific and Technical Information, Montreal Rd., Ottawa, ON, Canada K1A 0S2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

WO_3 is a semiconducting oxide absorbing in the visible part of the solar spectrum. Since it produces stable photoanodes in aqueous solution, this material has been contemplated as a possible candidate for assisted photoelectrolysis of water. As part of a study of the relation between the photoelectrochemical and photocatalytic properties of WO_3 coatings obtained by plasma spray, WO_3 coatings with a thickness of 40$\pm$ 20μm —mm have been obtained on titanium substrates. Scanning electron microscopy and x-ray diffraction have been used to characterize the WO_3 powders before and after injection in the plasma. The same techniques have also been used to characterize the coatings obtained with various projection conditions. The substoichiometry of plasma sprayed tungsten oxide has been determined by thermogravimetry. It is possible to obtain $WO_{2.99}$ (yellow) or $WO_{2.97}$ (dark blue) directly by projection. A thermal treatment allows the oxidation of $WO_{2.97}$ to the yellow form. Its seems that both colored substoichiometric forms of WO sub 3/ display the same crystalline structure but the yellow form shows the most defined x-ray spectrum. Even if the yellow coating diffractograms and the literature x-ray spectrum for orthorhombic WO_3 are similar, it is not possible to ascertain if plasma sprayed coatings are characterized either by the orthorhombic structure alone or by a mixture of the orthorhombic and monoclinic forms. 30 refs., 9 figs.

36644 (NRCC/IMR–28911) **Localized electrons in tetragonal $YBa_2Cu_{2.93}O_{6.38}$.** Inoue, Z.; Sasaki, S.; Dallaire, S.; Iyi, N.; Takekawa, S. National Research Council of Canada, Boucherville, PQ (Canada). Industrial Materials Research Inst. [1989]. 10p. (MICROLOG–89-00548). Available from Canada Institute for Scientific and Technical Information, Montreal Rd., Ottawa, ON, Canada K1A 0S2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The structure refinement of tetragonal $YBa_2Cu_{2.93}O_{6.38}$ has been carried out with the final R-value of 0.019 obtained by the X-ray single crystal diffraction method. Difference Fourier maps reveal the existence of localized electrons around Cu and Ba atoms in the unit cell. The crystal structure is closely related to the perovskite type. 20 refs., 3 figs., 4 tabs.

36645 (NRCC/IMR–29441) **Microstructural investigation of $RBa_2Cu_3O_{7-\delta}$ (R=Y, Gd, Nd).** Parent, L; Moreau, C.; Noel, D.; Dallaire, S.; Champagne, B. National Research Council of Canada, Boucherville, PQ (Canada). Industrial Materials Research Inst. [1989]. 11p. (MICROLOG–89-00589). Available from Canada Institute for Scientific and Technical Information, Montreal Rd., Ottawa, ON, Canada K1A 0S2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

$RBa_2Cu_3O_{7-\delta}$ perovskites, where R is Y, Gd and Nd, were synthetized using the same experimental conditions. The resistivity curves of the three compounds were similar but their microstructures were different. Secondary phases (CuO, $BaCuO_2$) were formed in the compounds containing Y and Gd while no such phases were detected in the Nd perovskite material. According to these preliminary results, the perovskite containing Nd is readily synthesized since the amount of secondary phases is much lower in that case. 7 refs., 4 figs., 1 tab.

36646 (NRCC/IMR–29447) **Solid-state interaction between nickel and $YBa_2Cu_3O_x$.** Champagne, B.; Parent, L.; Moreau, C. National Research Council of Canada, Boucherville, PQ (Canada). Industrial Materials Research Inst. [1989]. 13p. (MICROLOG–89-00580). Available from Canada Institute for Scientific and Technical Information, Montreal Rd., Ottawa, ON, Canada K1A 0S2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

As part of a search for suitable metals for use in composite cables made up of high-temperature superconductors in a metallic matrix, the solid-state reaction between nickel and $YBa_2Cu_3O_x$ was studied. Green compacts of $YBa_2Cu_3O_x$ were hot isostatically pressed (HIPed) in nickel. The microstructure, density and nature of phases present in HIPed parts were characterized. Resistivity measurements indicated that HIPed parts are not superconducting owing to the loss of oxygen and required an annealing step in oxygen for restoring superconductivity. The diffusion of nickel into $YBa_2Cu_3O_x$ as well as the diffusion of Ba, Cu and Y into nickel was very limited. However, a thin interaction zone consisting of a nickel-rich oxide compound was formed at the Ni-$YBa_2Cu_3O_x$ interface. The presence of such an interaction zone could have a detrimental effect on the thermal stabilization of Ni-$YBa_2Cu_3O_x$ composite wires. 7 refs., 6 figs., 1 tab.

36647 (SAND–88-2865C) **Annealing and strain effects on Tl-Ba-Ca-Cu-O crystals and ceramics.** Venturini, E.L.; Morosin, B.; Ginley, D.S.; Kwak, J.F.; Schirber, J.E.; Baughman, R.J.; Graham, R.A. Sandia National Labs., Albuquerque, NM (USA). 1989. 10p. Sponsored by DOE Energy Research. DOE Contract AC04-76DP00789. (CONF-890426–22: Spring meeting of the Materials Research Society, San Diego, California, USA, 24-28 Apr 1989). Order Number DE89014628/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Superconducting transition temperatures (T_c's) in the Tl–Ba–Ca–Cu–O system are shown to be a function of processing for both single crystals and bulk ceramics. Crystals with the identical structural phase and nominal composition but slightly different lattice constants can have significant differences in T_c. We report the effects of high temperature annealing in vacuum or flowing oxygen on T_c for single crystal plates of two common phases with nominal stoichiometries $Tl_2Ba_2Ca_1Cu_2O_8$ and $Tl_2Ba_2Ca_2Cu_3O_{10}$. Contradictory results on nominally similar crystals suggest that strain, Tl content and Tl/Ca site disorder are as important as the oxygen stoichiometry in determining T_c. This interpretation is supported by complementary annealing studies in bulk ceramic, including a powder where T_c increased by 5 K following high-pressure shock loading which introduced substantial residual strain. 25 refs., 6 figs.

36648 Investigation of the lanthanide sesquioxides as high temperature transformation toughening agents. Jero, P.D. 239p. Univ. of Illinois, Urbana, IL (1988).

One of the recent bright spots in the field of engineered materials was the developed of transformation toughened ZrO_2 ceramics. This one discovery led to a whole new class of strong, tough engineered ceramics. Recently, Kriven reviewed phase transformations in a number of inorganic materials which show potential as transformation toughening agents. Amongst those materials are the

lanthanide sesquioxides. Known for their thermal stability, several of the lanthanide sesquioxides exhibit, on cooling, the requisite rapid phase transformation from a high temperature monoclinic (B) phase to a less dense low temperature cubic (C) phase. The volume expansion is about 8 to 10%, but the transformation mechanism is not known. The transformation is in several ways similar to the martensitic tetragonal to monoclinic transformation in ZrO_2. The aim of this work was to investigate the C$\Longleftrightarrow$B transformation in the lanthanide sesquioxides and evaluate their potential as transformation toughening agents, particularly at high temperature. A detailed description of the lanthanide sesquioxides serves (1) to introduce the reader to a subject which may well be new to him or her and (2) to indicate the complexity of the materials being examined. The literature is voluminous and yet relatively few researchers have studied these materials. Two groups, one in France, the other in the USSR, account for much of the basic research done so far. This results, undoubtedly, from the fact that ultra high temperatures are often required in the study of these materials. Both of the above groups have ultra high temperature solar furnaces with x-ray diffraction and thermal analysis attachments. 218 references.

36649 X-ray absorption spectroscopy investigations of high Tc superconductors. Greeger, R.B. (The Boeing Co., Seattle, WA (US)); Marques, E.C.; Lytle, F.W.; Larson, E.M.; Peterson, D.; Panson, A.J.; Stohr, J. v.v of 1988 Pittsburgh conference and exposition on analytical chemistry and applied spectroscopy (abstracts). Pittsburgh Conference, Pittsburgh, PA (1988). (CONF-880204–: 39. Pittsburgh conference and exposition on analytical chemistry and applied spectroscopy, New Orleans, LA, USA, 22-26 Feb 1988).

Technical Paper NO. 010.

The X-ray and neutron diffraction techniques commonly used for investigating the structure of materials have limitations in sensitivity when the scattering factors of the different elements are similar. In contrast, x-ray absorption spectroscopy has an element specific advantage in that the x-ray energy can be tuned to an absorption edge of each type of atom in the material. The structure probe then becomes the quantum interference of the ejected photoelectrons as they scatter from atoms surrounding the absorbing species. The resulting x-ray absorption near edge structure (XANES) and extended x-ray absorption fine structure (EXAFS) are sensitive to various structural and chemical parameters including bond distance, coordination number, disorder and valence. The absorption spectra of well-characterized samples of $YBa_2Cu_3O_7$ and $La_{1.8}Sr_{0.2}CuO_4$ were measured at the Stanford Synchrotron Radiation Laboratory. The results showed that in addition to the normal lattice sites which are known from x-ray and neutron diffraction refinements, a significant anti-site disorder exists between Cu and Y/La sites.

36650 Composition and structure of the passive oxide film on iron as observed by second harmonic generation. Schauer, M.W. (Argonne National Lab., 9700 South Cass Avenue, Argonne, IL (US)); Frye, J.M.; Biwer, B.M.; Pellin, M.J.; Gruen, D.M. v.v of Proceedings of the Electrochemical Society fall meeting. Volume 88-2 (extended abstracts). The Electrochemical Society, Pennington, NJ (1988). (CONF-881061–: Electrochemical Society fall meeting, Chicago, Illinois, USA, 9-14 Oct 1988).

The technique of Second Harmonic Generation (SHG) as a surface analytical tool has progressed to the point where scientific information, not easily observed by other means, can be obtained for systems such as metal surfaces undergoing electrochemical reactions. Despite extensive study, the compositional and structural details of the passive oxide layer on iron are not well understood. SHG is extremely sensitive to compositional changes as an iron electrode is cycled. Resonance enhancement of the SHG signal can be correlated with the expected electronic spectroscopy of the various iron oxide species believed to be present. In addition, by using an incident frequency for which no resonance enhancement is observed, changes in the SHG signal can be interpreted as due to charging. This provides further information about the electrical properties of the film. By comparing the SHG results for the iron electrochemical system with previous models of the iron passive layer, new understanding about the composition of this system has been realized. SHG intensity as a function of potential is plotted for cycling an Fe electrode. The top curve represents the current and shows the well-known waves associated with oxidation and reduction of iron. The second curve shows the SHG intensity using 1.06 μ (detecting 532 nm) light as the fundamental. The authors believe that surface charging contributes significantly to the SHG intensity in the 1.06 μ SHG experiment. On the other hand, resonance enhancement is largely responsible for the intensity in the 532 nm SHG experiment. The lower curve displays the SHG intensity using 532 nm light as the fundamental (detecting 266 nm).

36651 In situ high-temperature cross-sectional TEM specimen preparation. Fiore, E.M. (Martin Marietta Labs., 1450 S. Rolling Rd., Baltimore, MD (US)); Herring, R.A. v.v of Specimen preparation for transmission electron microscopy of materials. Bravman, J.C.; Anderson, R.M.; McDonald, M.L. Materials Research Society, Pittsburgh, PA (1988). (CONF-871297–: Symposium on specimen preparation for transmission electron microscopy of materials, Boston, Massachusetts, USA, 3 Dec 1987).

The authors describe a technique for preparing transmission electron microscope (TEM) cross-sectional specimens for observation during in situ annealing to high temperatures. The process utilizes a ceramic adhesive that is stable to a temperature of 1650^{0}C. The technique, which was successfully used to observe the recrystallization of amorphized silicon, is being applied to high-energy ion-implanted silicon in an attempt to better understand the amorphous-to-crystalline phase transformation and detect formation mechanisms resulting from thermal processing.

36652 Phase relations in quaternary copper oxide electrodes. Ahn, B.T. (IBM Almaden Research Center, San Jose, CA (US)); Gur, T.M.; Huggins, R.A. v.v of Electro-ceramics and solid-state ionics. Tuller, H.L.; Smyth, D.M. The Electrochemical Society, Pennington, NJ (1987). (CONF-8710306–: Symposium on electro ceramics and solid state ionics, Honolulu, HI, USA, 18-23 Oct 1987).

Multicomponent oxides have been used as oxygen electrode materials in high temperature electrochemical cells, and have also been explored for use as cathodes in alkali metal batteries at lower temperatures. The practical usefulness of such materials depends to a large extent on their thermodynamic stability over the range of oxygen activities imposed during synthesis and under operating conditions. This paper reports the use of a solid state ionic technique to study the phase relations and to determine the stability limits at 850^{0}C for $Y_1Ba_2Cu_3O_{7-x}$, a material which may be useful either as an oxygen electrode material in high temperature electrochemical cells, or in low temperature high energy batteries. This material has also recently attracted unprecedented attention as a high temperature superconductor.

36653 Compacted 1-2-3 ceramic powders treated as superconducting composites. Collings, E.W. (0747000); Markworth, A.J.; Marken, K.R. Jr. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA)*, 25(2): 2175-2179 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

Magnetization studies of closely spaced fine-filamentary Cu/NbTi composites have shown that at very low applied field strengths proximity-effect coupling (across the Cu matrix) between the filaments causes the assembly to exclude flux in the manner of a solid block of superconductor of the same outside diameter as the filamentary bundle. Then at somewhat higher applied field strengths (but still with $H < H_{c1}$) the conductor behaves as a cluster of independent filaments. Next, in this regime and provided the filaments are sufficiently fine, field penetration reduces the volume of excluded flux significantly below the geometrically calculated value. Since the field-penetration depth increases with temperature according to $1/\sqrt{(1-t^4)}$ where $t=T/T_c$, the effect becomes more and more pronounced as T approaches T_c. Comparable proximity- and field-penetration effects are seen in high-T_c ceramic-powder compacts. Finally, it is suggested that granularity of some kind, with its associated field-penetration effect, could well be responsible for most the departures from almost complete flux exclusion that have been observed in almost fully single-phase ceramic samples – material which would otherwise be expected to exhibit a sharp magnetic transition at T_c.

36654 Properties of the new high T_c materials. Kresin, V.Z. (9513034); Deutscher, G.; Wolf, S.A. *IEEE (Institute of Electrical*

and Electronics Engineers) Transactions on Magnetics (USA), 25(2): 2333-2336 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

A key feature of the high T_c oxides is a very small value of the Fermi energy. This feature leads to peculiar thermodynamic and transport properties in the normal and superconductive state.

36655 (AD-A–204736/3/XAB) **Methods for studying effects of high-energy irradiation on the mechanical and electric properties of polymers.** Hedvig, P. Hacettepe Univ., Ankara (Turkey). 1987. 95p. Available from NTIS, PC A05/MF A01.

High-energy electron, x-ray or gamma irradiation is known to result in degradation and/or crosslinking of polymers. Crosslinking usually dominates when the polymer is irradiated in the absence of oxygen, while degradation is overwhelming when oxygen is present. The aim of this paper is to discuss how to measure the effects of high-energy irradiation on the main mechanical and electric properties of polymers.

36656 (AD-A–204822/1/XAB) **Scanning tunneling microscopy of an ion-bombarded PbS(001) surface.** Wilson, I.H.; Zheng, N.J.; Knipping, U.; Tsong, I.S. Arizona State Univ., Tempe, AZ (USA). Dept. of Physics and Astronomy. 21 Nov 1988. 4p. Available from NTIS, PC A02/MF A01.

Pub. in Applied Physics Letter, Vol. 53, No. 21, 2039-2041(21 Nov 1988).

Freshly cleaved (001) surfaces of single-crystalline PbS were bombarded by 8-keV Kr(+) ions at a dose of 3×10^{12}/sq. cm. Atomically resolved scanning tunneling microscopy (STM) images were taken showing damaged areas due to individual ion impacts. Analysis of an STM image shows a shallow impact crater, a stacking fault, displacement of Pb(2+) and S(2-) ions from their regular surface sites, and migration of interstitials to the surface.

36657 (AD-A–204881/7/XAB) **Proton backscattering in bulk silicon at large angles of incidence. Final report.** Tallon, R.W.; Hoffland, A.H.; Kemp, W.T.; Locker, T.R. Air Force Weapons Lab., Kirtland AFB, NM (USA). Dec 1988. 26p. (AFWL-TR–88-92). Available from NTIS, PC A03/MF A01.

This report describes proton-backscatter studies performed at the Tandem Van de Graaff Accelerator Facility. The objective was to determine if backscattering protons were sufficient to alter the radiation-induced proton damage in silicon electronics when high-energy protons (6 MeV and below) bombarded bulk silicon at large angles of incidence (>65 deg). The overall results showed that when the angles of incidence of bombarding protons (on bulk silicon) approached 80 deg, and their energies were lowered to about 100 KeV the number of backscattering protons approached 12% of the bombarding number. At this point (and at lower energies), the effect of the backscattering protons would become significant and they would have to be taken into account when determining the radiation induced proton damage in silicon electronics. The number of backscattering protons, their energies, and their angles of reflection (for silicon and other solids) can accurately be determined from a computer program called TRIM (Transport of Ions in Matter).

36658 (AD-A–204914/6/XAB) **Far- and mid-infrared properties of metal-insulator composite materials. Annual letter report, 1 January-31 December 1988.** Devaty, R.P. Pittsburgh Univ., PA (USA). Dept. of Physics and Astronomy. 1988. 40p. Available from NTIS, PC A03/MF A01.

The infrared properties of thin Pt/Al_2O_3 granular metal-insulator composite films (cermets) were investigated using Fourier transform spectroscopy. The films were grown by dual-electron-beam evaporation onto polished single-crystal sapphire substrates. The metallic volume fraction, which was controlled by the deposition conditions, ranged from 23% to 100% in the set of samples. The percolation threshold estimate from the temperature dependence of the dc resistance is greater than 50%, which implies that the Pt particles are highly correlated. The percolation threshold for a random metal-insulator mixture is less than 20%. The transmission and relative reflection of the films were measured at room temperature using a Nicolet 740 Fourier transform infrared spectrometer (FTIR), which arrived at the beginning of the year. The mid- and near-infrared regions (400-15250 cm-1) were covered using three combinations of sources, beamsplitters, and detectors. The reflection standard was a 100% Pt film from the sample set.

36659 (BNL–42655) **Cognition and order in Langmuir-Blodgett films of a 3-hexadecyl pyrrole and ferrocene-derivatized pyrrole mixed monolayer system.** Samuelson, L.; Rahman, A.K.M.; Puglia, G.P.; Clough, S.; Tripathy, S.; Inagaki, T.; Yang, X.Q.; Skotheim, T.A.; Okamoto, Y. Brookhaven National Lab., Upton, NY (USA). 1989. 10p. Sponsored by DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-8903128–1: International conference on intelligent materials, Tsukuba, Japan, Mar 1989). Order Number DE89012974/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Novel, self-assembled materials have been designed and produced from first principle to possess unique structural hierarchy and electronic and optical properties. The Langmuir-Blodgett technique was used to study the molecular organization of a mixed 3-hexadecyl pyrrole (3HDP) and ferrocene-derivatized pyrrole (Fc-Py) surfactant system. The pyrrole moiety was chosen for its' well established electronic and optical properties when polymerized, while ferrocene, it is theorized, if properly oriented into a Langmuir-Blodgett monolayer film may show a layered array of transition metals which would be extremely valuable as a model for two-dimensional magnets. The ferrocene group may also provide the possibility of charge coupling between neutral ferrocene and oxidized ferricenium which could be controlled electrochemically or photochemically. It has been determined that stable monolayer films of the mixed system could be formed at the air-water interface. The growth and assembly process led to polypyrrole 2-D lattices with heretofore unsurpassed order. In fact, the process of template polymerization leads to a new crystal phase for the polypyrrole component of the thin film structure. Various monolayer and multilayer films were prepared on platinum coated substrates for surface spectroscopic characterization using synchrotron radiation. Near Edge X-Ray Absorption Fine Structure studies revealed that highly ordered multilayer structures are being formed. 8 refs., 4 figs., 1 tab.

36660 (CCL–87081) **Development of air-entrained, high-strength concrete. Normal weight concrete.** Bedard, C.; CAIL, K. Canada Cement Lafarge Ltd., Woodstock, ON (Canada). 1987. 23p. (MICROLOG–88-05971). Available from Canada Centre for Mineral and Energy Technology, Technical Information Division, 555 Booth St., Rm. 342, Ottawa, ON, Canada K1A 0G1; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The potential construction of offshore concrete platforms off the coast of Newfoundland has created a demand for high performance concrete made from local materials. This paper reports the developments of air-entrained, high-strength concrete incorporating mineral admixtures and a high-range water reducer. In some of the mixtures, steel or polypropylene fibers were incorporated to improve the impact and abrasion resistance of concrete. 14 concrete mixtures comprising 45 batches were made in this investigation, and a total of 686 cylindrical, prism, and slab specimens were tested. It is concluded that air-entrained, high-strength concrete with a strength >80 megapascals (MPa) at 91 days can be produced using materials from the Atlantic provinces. The highest strength achieved was 85 MPa for a mixture incorporating 15% Class F fly ash, 6% condensed silica fume, and a high-range water reducer. The concrete so developed has excellent frost resistance and very low permeability. 7 refs., 12 tabs.

36661 (CCL–87082) **Development of air-entrained, high-strength concrete. Lightweight concrete.** Bedard, C.; Cail, K. Canada Cement Lafarge Ltd., Woodstock, ON (Canada). 1987. 14p. (MICROLOG–88-05971). Available from Canada Centre for Mineral and Energy Technology, Technical Information Division, 555 Booth St., Rm. 342, Ottawa, ON, Canada K1A 0G1; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Tests were carried out on the production of high-strength (>50 megapascals) lightweight concrete of the type suitable for use in offshore platforms. The concrete was batched in a commercial ready-mix concrete plant, and used an air-entraining admixture, superplasticizer, and silica fume as additives. The aggregate was obtained from a local source. From the test results, it is concluded that lightweight concretes with compressive strengths approaching 70 megapascals at 91 days and densities of the orders of 2000 kg// m^3 can be produced commercially. This type of concrete has a flexural strength of ca 7 megapascals, is air-entrained, and has satisfactory resistance to repeated cycles of freezing and thawing. 1 ref., 5 tabs.

36662 (CONF-890435–4) **Structural and thermodynamic evidence for the survival of Zintl ions through the melting process: The alkali-lead alloys.** Saboungi, M.L.; Johnson, G.K.; Price, D.L.; Reijers, H.T.J. Argonne National Lab., IL (USA). 1989. 18p. Sponsored by DOE Energy Research. DOE Contract W-31109-ENG-38. From 6. international conference on high temperatures: chemistry of inorganic materials; Gaithersburg, Maryland, USA; 3-7 Apr 1989. Order Number DE89013646/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Recent heat capacity and neutron diffraction measurements carried out on liquid equiatomic alkali-lead alloys give unambiguous evidence for the survival of Zintl compounds in the liquid. The presence of polyvalent anionic species, Pb_4^{4-}, is responsible for the anomalous temperature dependence of the heat capacity. Models based on the presence of A_4Pb_4 structural units in the liquid are used to interpret the changes in the width and position of the FSDP as the alkali metal, A, changes from Na to Cs. 18 refs., 7 figs.

36663 (CONF-890627–2) **The texture variation in extruded graphite.** Kennedy, C.R.; Hobson, D.O.; Woodruff, E.M. Oak Ridge National Lab., TN (USA); Westinghouse Hanford Co., Richland, WA (USA). 1989. 2p. Sponsored by DOE Energy Research. DOE Contract AC05-84OR21400;AC06-76RL01857. From 19. biennial conference on carbon; University Park, Pennsylvania, USA; 25-30 Jun 1989. Order Number DE89014086/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The effect of the extrusion process in creating a significant variation in the preferred orientation has been demonstrated. The variation in physical properties, primarily dependent on crystallite orientation (CTE, electrical resistivity, and elastic constants), is shown to be in good agreement with calculated values. TSX graphite is also shown to have a preferred orientation in flaw structure as determined by sonic attenuation measurements. The expected variability in strength, using a fracture mechanics approach, is described. The effect of this variability also has been shown to have a strong effect on the dimensional change in grade TSX under nuclear irradiation. 5 refs., 7 figs.

36665 (CONF-8509443–1) **Techniques for producing monodispersed biocatalyst beads for use in columnar bioreactors.** Scott, C.D. Oak Ridge National Lab., TN (USA). 1985. 11p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. From 8. enzyme engineering; Helsingor, Denmark; 22-27 Sep 1985. Order Number DE89014194/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The use of columnar bioreactors such as fixed or fluidized beds requires that the biocatalyst (e.g., microorganism) be immobilized into or onto solid support materials that will not be swept out of the bioreactor at the high flow rates frequently used in these systems. At the same time, the pathlength to and through the biocatalyst must be relatively short to reduce the effects of mass transport of substrates and products; thus, small particles or thin films of the biocatalyst should be used. In the case of fluidized-bed systems, the resulting particles must also be sufficiently small and dense to ensure fluidization without washout. If active microorganisms are used, immobilization can be carried out by interaction of the cell with a particulate surface or by encapsulation or entrapment of the organisms into a solid matrix such as a hydrocolloidal gel. The latter approach is of particular interest for systems where a well-defined microbial population is to be maintained, especially if system asepsis cannot be ensured. 9 refs., 2 figs., 2 tabs.

36666 (DND/RDB–1/88) **Superconductivity. Recent developments and defence applications (U).** MacPherson, R.W. Department of National Defence, Ottawa, ON (Canada). Research and Development Branch. 1988. V (MICROLOG–88-05995). Available from Canada Dept. of National Defence, 101 Colonel By Dr., 2NT, National Defence Headquarters, Ottawa, ON, Canada K1A 0K2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The recent discovery of a new class of superconducting materials that exhibit superconducting properties at temperatures high enough that cooling can be obtained with liquid nitrogen has aroused interest in the identification of a number of potential uses for these materials. A review of defence-related applications is presented, based on a survey of the literature and of scientists working in the field. The background to the discovery of the new superconductors is summarized, and the properties of the new materials are contrasted with those of conventional superconductors. Research activities in the field of high-temperature superconductivity around the world are outlined. Most of the applications envisioned for the new superconducting materials are extensions of devices or systems already explored or exploited with conventional superconductors, and fall into such categories as microelectronics, sensor technology, electromagnetic propulsion, energy storage devices, medical apparatus, frictionless bearings, and power transmission. It is felt that defence applications involving SQUID devices and superconducting magnets should appear relatively soon. 36 refs.

36667 (DOE/ER/45254–3) **Staging in layer intercalates: Progress report, 1 June 1988–31 May 1989.** Fischer, J.E. Pennsylvania Univ., Philadelphia, PA (USA). Board of Trustees. 7 Dec 1988. 4p. Sponsored by DOE Energy Research. DOE Contract FG02-86ER45254. Order Number DE89014860/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The emphasis has been on detailed studies of staging, melting and shear dynamics in Li-GIC's with exploratory work on a prototype acceptor GIC, Li_xTiS_2, polyacetylene and BiSrCaCuO single crystals. Work is briefly described in the following areas: elastic interactions and staging; high-t in-plane structure in LiC_6; staging, melting and shear dynamics in Li_xC_6; in-plane ordering and stage disorder in C_8AsF_5; and staging in doped polymers.

36668 **Chemistry and microstructure at metal-polymer interfaces.** Ho, P.S. (IBM Thomas J Watson Research Center, Yorktown Heights, NY (USA)); Haight, R.; White, R.C.; Silverman, B.D. pp. 12 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

This paper summarizes the present knowledge of the chemistry and microstructure at metal-polymer interfaces formed on PMDA-ODA polyimide. The nature of chemical bonding was deduced from electronic structures observed by photoemission spectroscopies and interpreted by molecular orbital calculations. Bonding at the initial coverages of the metals studied are well described by the formation of metal-polymer complexes as a result of delocalized charge transfer from the metal to the polymer repeat unit. The microstructure was observed directly by transmission electron microscopy and ion scattering techniques. The morphology was found to be strongly dependent on the chemical reactivity of the interface. This correlation between chemistry and microstructure is important for understanding adhesion at the metal-polymer interface.

36669 **Molecular dynamics study of the structure and properties of twist boundaries.** Counterman, C. (Massachusetts

Institute of Technology, Cambridge (USA)); Chen, L.Q.; Kalonji, G. pp. 12 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Molecular dynamics simulations of the structure and thermodynamic properties of Σ5 (001) twist boundaries were performed. The systems interacted through interatomic potential functions chosen to represent Ar and NaCl, and the simulations were conducted over a range of temperatures from low temperature to bulk melting. Excess thermodynamic properties were calculated through the use of perfect crystal reference systems. Structural changes with temperature were assessed with a variety of techniques, including the use of bicrystal Patterson functions. Both systems exhibit significant disordering at the grain boundaries at temperatures below bulk melting, a disorder which increases quite continuously with temperature. The NaCl system remains well ordered up to much higher relative temperatures than does the Ar system.

36670 Grain boundaries and antiphase boundaries in GaAs. Cho, N.H. (Cornell Univ., Ithaca, NY (USA)); McKernan, S.; Wagner, D.K.; Carter, C.B. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Bicrystals of GaAs with a predetermined orientation relationships between the grains have been produced by growing GaAs epilayers on substrates cut from Czochralski-grown germanium bicrystals. Grain boundaries have also been generated in GaAs epilayers grown on (110) Ge substrate. In this report, an extensive study of such interfaces is illustrated by a transmission electron microscopy (TEM) study of the atomic structure of first-, second- and third-order twin boundaries. Antiphase boundaries (APBs) have also been produced in GaAs epilayers grown epitactically on Ge substrates. Both the structure of these interfaces and the interactions of the APBs with grain boundaries and lattice dislocations have been examined using TEM.

36671 Atomic structure of vitreous interfacial films in sialon. Thorel, A. (Ecole des Mines de Paris, Evry (France)); Laval, J.Y.; Broussaud, D. pp. 4 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Atomic resolution imaging of siliceous interfacial films in a sialon has been achieved using transmission electron microscopy at 1000 KV. Although such films have always been reputed as vitreous, the authors show that they are at least partially crystallized. An atomic model is proposed and simulated. The stability of these films is discussed when special crystallographic relationships exist between the two adjacent grains.

36672 Structure and local electrical properties of grain boundaries in polycrystalline semiconductors. Laval, J.Y. (Laboratoire des Microstructures, Paris (France)); Pinet-Berger, M.H.; Cabanel, C. pp. 12 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The electrical properties of polycrystalline semiconductors are strongly related to their intergranular microstructures. It is first shown how the electrical behavior of carriers can be basically deduced from the electronic structure of simple interfaces. Experimentally, bulk methods do not have usually a sufficient spatial resolution and do not permit a direct correlation between the local structure and the electrical properties. Local investigations, especially by in situ techniques in transmission electron microscopy are reported. Finally the key role of the distribution of the different types of boundaries to relate the local properties to the bulk behavior is underlined.

36673 EBIC and DLTS measurements of SI- and polycrystalline silicon. Bary, A. (Universite de Caen (France)); Hamet, J.F.; Ihlal, A.; Chermant, J.L.; Nouet, G. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

Influence of grain boundaries on the electronic properties of silicon has been studied by electron-beam induced current (EBIC), thermally stimulated capacitance (TSCAP) and deep-level transient spectroscopy (DLTS). Low-angle grain boundaries taken from as-grown polycrystalline wafers for solar cells have been analyzed by EBIC and their behaviors have been compared after the junction diffusion treatment. This treatment gives a decrease of the local diffusion length and recombination velocity of the minority carriers. TSCAP and DLTS methods have been applied to a coincidence orientation grain boundary Σ13. These measurements have been made on a gold diffused bicrystal which was homogenized by annealing. These results are then compared with those of a bicrystal without gold diffusion but with the same thermal treatment. After annealing a narrow interface state continuum appears. On the contrary the gold diffusion prevents the formation of this continuum and only the donor level of gold is detected in the space charge region of the grain boundary (0 - 0.5 μm). This diffusion of phosphorus or gold can be interpreted as a grain boundary passivation.

36674 (FCC–068-D-129-P2) **A field evaluation of four wood pole groundline preservative formulations using western Canadian wood species.** Ruddick, J.N.R. Forintek Canada Corp., Vancouver, BC (Canada). Western Forest Products Lab. 1987. 141p. (CE–02627). Available from Canadian Electrical Association, Research & Development, Suite #500, One Westmount Square, Montreal, PQ, Canada H3Z 2P9; $75.00 NON-MEMBERS; MEMBERS: PRICES UPON REQUEST, FUNDS CAN.

The objective of the study was to determine whether copper-8-quinolinolate, copper naphthenate or bis(tributyltin) oxide (TBTO) are equivalent to pentachlorophenol in extending the service life of utility poles in western Canada, when applied as a groundline in-situ treatment using the pressure spade. Stubs prepared from utility poles were installed in a test plot and pressure spade treated with the four preservative greases. The preservative content of each pole stub was determined prior to remedial treatment and after one and three years of exposure. Bioassays on core samples removed from the stubs assessed changes in the protection against standard wood destroying fungi. The limited penetrations recorded (< 6 mm) suggested that improved protection is due primarily to the grease at the pole-soil interface. Evaluation of the grease retentions showed that all four formulations should have enhanced protection, in the 0-6 mm assay zone. The bioassay test showed that only TBTO and pentachlorophenol reduced fungal growth, an observation that may be related to the fact that both have a positive vapor pressure. Based upon both the chemical retention data and the bioassays, it was concluded that either copper naphthenate or TBTO, or even a mixture of both, could be used as alternatives to pentachlorophenol for use in grease remedial treatment. 22 refs., 32 figs., 28 tabs.

36675 (FRCEA-TH–182) **Characterization by positron annihilation of vacancies in gallium arsenide.** Stucky, M. Paris-11 Univ., 91 - Orsay (France); Institut National des Sciences et Techniques Nucleaires (INSTN), Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Jan 1987. 139p. (In French). Order Number DE89789256/JAW. Available from NTIS (US Sales Only), PC A07/MF A01.

Lifetime of positrons is used for evidencing vacancies in native or electron irradiated gallium arsenide. Temperature effects and dopping effects on proton trapping in vacancies are studied. In irradiated and non-irradiated GaAs positron response to a given temperature is dependent on Fermi level position. In native GaAs the positron is trapped only in n materials. Two types of traps T1 and T2 are found in n-doped (by Te or Sn) GaAs. At low doping trapping is obtained mainly by T2 for T<100K and by T1 for T>250K, between 100-250K both trappings occur. When doping increases T1 traps decrease. T1 and T2 traps disappear after annealing at 700-800K or electron irradiation at 300K. These 2 traps are attributed to a vacancy with two configurations dependent on Fermi level position. In irradiated GaAs, two types of vacancies occur. The first one is neutral or negative is annealed between 250

and 350K and is identified to a complexed or isolated gallium vacancy. The second one is neutral or negative in n materials, annealed around 500K and identified to an arsenium vacancy associated to a gallium interstitial.

36676 (INIS-mf–11987) **Radiation damages in silicon induced by highly energetic electrons and protons.** Wondrak, W. Frankfurt Univ. (Germany, F.R.). Fachbereich 13 Physik. 23 Jan 1986. 201p. (In German). Order Number DE89788626/JAW. Available from NTIS (US Sales Only), PC A10/MF A01.

In the present thesis physical radiation effects in silicon are investigated, which were produced by high-energetic electrons and protons. Emphasis was laid on those energy and fluence ranges which are important for the production of recombination centers in devices. By means of DLTS several defect levels were found. (BHO).

36677 (KFK–4563) **Ion beam modification and analysis of thin $YBa_2Cu_3O_7$ films.** Meyer, O. Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Nukleare Festkoerperphysik. Apr 1989. 38p. Order Number DE89788424/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The application of ion beams for the analysis and modification of high Tc superconductors is reviewed. Ion backscattering and channeling spectroscopy is used to optimize the film composition and the epitaxial growth performance on various single crystalline substrates. The influence of radiation damage on the transport properties and on the structure of polycrystalline as well as of single crystalline thin films is presented. The irradiation induced metal to insulator phase transition is discussed in detail. Some applications including the use of ion implantation for structuring are summarized.

36678 (MLM–3592(OP)) **The effective utilization of differential scanning calorimetry (DSC) to assess molded parts.** Kaye, C.J. EG and G Mound Applied Technologies, Miamisburg, OH (USA). 1989. 10p. Sponsored by DOE Defense Programs. DOE Contract AC04-88DP43495. (CONF-8905165–1: ANTEC '89, New York, NY, USA, 1-4 May 1989). Order Number DE89014737/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A widely accepted method for determining degree of cure of diallyl pthlalate (DAP) resin based molded parts is differential scanning calorimetry (DSC). The differential scanning calorimeter is a laboratory instrument which measures the exothermic heat of reaction as the thermosetting molding compound undergoes polymerization (cure). It is standard industry practice to utilize the data from this analysis to assign the percentage of cure for the molded part. This practice was addressed for several reasons. First, the DSC versus cure time is not a linear function. However, the usual convention specifies a linear scale for the percentage cure. This can cause concern for the customer when this calculated "percentage cure" is below a value that is perceived as acceptable. This perception is often based on a psychological premise as to the quality of the part as it relates to the percentage cure and not to the associated physical properties of the part. 3 refs., 3 figs., 1 tab.

36679 (NRCC–29443) **Abrasion-erosion resistance of various repairing mortars.** Mirza, J.; Turenne, S.; Masounave, J. Institut de Recherche d'Hydro-Quebec, Varennes, PQ (Canada); National Research Council of Canada, Boucherville, PQ (Canada). Industrial Materials Research Inst. [1989]. 27p. (MICROLOG–89-00593). Available from Canada Institute for Scientific and Technical Information, Montreal Rd., Ottawa, ON, Canada K1A 0S2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Slurry erosion tests were made in order to determine the factors influencing the abrasion-erosion resistance of some mortars. Such mortars would be used to repair concrete hydraulic structures subjected to erosion, such as those found in hydroelectric power plants. The apparatus used produced a slurry jet which impinged the surface of mortar speciments with an incidence angle of 45^0 and a velocity of 18.5 m/s. The results showed that the epoxy mortars were the most erosion wear resistant compared with grouts and polymer mortars. The wear of mortars is controlled by the wear of the binder (epoxy or cement) and a strong relation exists between the erosion resistance of the mortar and the absence of microporosity in the binder. The results also suggest minimizing the exposed areas of the binder by using sand particles with a wide size distribution. 7 refs., 7 figs., 2 tabs.

36680 Scattering, deformation, and fracture in polymers. Materials Research Society symposia proceedings. Volume 79. Wignall, G.D.; Crist, B.; Russell, T.P.; Thomas, E.L. 454p. Materials Research Society, Pittsburgh, PA (1987). (CONF-861207–: Materials Research Society fall meeting, Boston, MA, USA, 1-5 Dec 1986).

This book contains over 40 papers. Some of the titles are: Computer simulation of stress-strain behavior in polymeric materials; Neutron scattering from charged polymer lattices; EXAF analysis of ionomers; Impact of isotope effects on the small angle neutron scattering analysis of amorphous polymers; and Studies of molecular orientation in deformed semi-crystalline polymers by x-ray scattering employing synchrotron radiation.

36681 The preparation of TEM specimens from hazardous or difficult materials. Sklad, P.S. (Metals and Ceramics Div., Oak Ridge National Lab., P.O. Box X, Oak Ridge, TN (US)). v.v of Specimen preparation for transmission electron microscopy of materials. Bravman, J.C.; Anderson, R.M.; McDonald, M.L. Materials Research Society, Pittsburgh, PA (1988). (CONF-871297–: Symposium on specimen preparation for transmission electron microscopy of materials, Boston, Massachusetts, USA, 3 Dec 1987).

The first, and often the most critical step in any electron microscopy investigation is the preparation of an electron transparent specimen which is representative of the bulk material and in which the features of interest can be clearly observed and interpreted. However, for many materials of technological importance, specimen preparation procedures are far from routine. The application of standard, established techniques may be limited by material inhomogeneities, by physical constraints such as size or geometry, or by material constraints such as toxicity, radioactivity, or reactivity. Examples illustrating techniques for overcoming some of these difficulties are reviewed.

36682 Thermal fracture in selected nonlinear optical materials. Eimerl, D. (Lawrence Livermore National Lab., P.O. Box 5508, L-490, Livermore, CA (US)); Marion, J.; Graham, E.K. v.v of New slab and solid-state laser technologies and applications. Guch, S.; Eggleston, J. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (1987). (CONF-870132–: OE/LASE '87, Los Angeles, CA, USA, 11-16 Jan 1987).

It is well-known that under uniform heating, a thin plate develops a quadratic temperature profile with the thermal gradient normal to the plate surface. The central part of the plate is warmer than the surfaces, and also undergoes thermal expansion. The thermal expansion normal to the surface produces no stress, but the thermal expansion parallel to the plate surface puts the surface in tension and the central part in compression. A simple but useful model of the plate treats it as a set of three isothermal plates arranged in the order cold-warm-cold. The warm part is ΔT warmer than the cold surfaces, and left to itself it would expand by $\alpha\Delta T$. Being constrained by the surface, it is in compression. If the warm part had infinite modulus, the resulting strain in the surface would be $\alpha\Delta T$. Because it relaxes, the actual surface strain is reduced by 1/3. By Hooke's law the stress is proportional to the strain, so that the surface stress is simply 2/3 . $E\alpha\Delta T$, where E is Young's modulus. It is also well-known that a material under strain in one direction changes its dimensions in the transverse directions. The surface regions are under tension, and therefore they acquire a component of strain normal to the plate surface.

36683 Fracture mechanisms and strengthening of slab lasers. Marion, J.E. (Lawrence Livermore National Lab., Univ. of California, P.O. Box 5508, L-490, Livermore, CA 94550 (US)). v.v of New slab and solid-state laser technologies and applications. Guch, S.; Eggleston, J. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (1987). (CONF-870132–: OE/LASE '87, Los Angeles, CA, USA, 11-16 Jan 1987).

The fracture mechanisms of slab lasers are examined and the critical defects, induced during optical fabrication, are identified. A rationale for determining an appropriate operating stress for the slab laser is outlined, based on Weibull statistics, and this method is experimentally assessed in full-sized slab fracture tests. Techniques

for achieving strong slabs are then examined. The authors determine that strengthening by subsurface damage minimization has the highest potential for strengthening, but that slab durability must also be enhanced in order for the slab to remain strong in practice. Good chemical durability is achieved by the use of water-proof overcoats. Good mechanical durability is achieved by the use of compressive surface layers. The compressive surface layers prevent the deterioration in slab strength from physical damage to the slab surface.

36684 Compton profile of graphite and lithium-intercalated graphite. Chou, M.Y. (Dept. of Physics, Univ. of California, CA (US)); Cohen, M.L.; Louie, S.G. v.v of Graphite intercalation compounds. Eklund, P.C.; Dresselhaus, M.S.; Dresselhaus, G. Materials Research Society, Pittsburgh, PA (1984). (CONF-841157–: Materials Research Society annual meeting, Boston, Massachusetts, USA, 26-29 Nov 1984).

The momentum distribution of the valence electrons in graphite and lithium-intercalated graphite LiC_6 is studied by calculating the Compton profiles. The wave functions are generated from a self-consistent calculation using the pseudopotential method within the local density functional formalism and a mixed basis set consisting of plane waves and linear combinations of atomic orbitals. Compton profiles along the (0001) direction are presented for both graphite and LiC_6. The difference between profiles of LiC_6 and graphite exhibits characteristic features which provide information about the change in the electronic properties resulting from intercalation.

36685 Cross-sectioning magnetic thin films for TEM. Ho, H.M. (Dept. of Materials Science and Mineral Engineering and Materials and Chemical Sciences Div., Lawrence Berkeley Lab., Univ. of California, Berkeley, CA (US)); Thomas, G.; Schooley, C.N.; Gau, J.S. v.v of Specimen preparation for transmission electron microscopy of materials. Bravman, J.C.; Anderson, R.M.; McDonald, M.L. Materials Research Society, Pittsburgh, PA (1988). (CONF-871297–: Symposium on specimen preparation for transmission electron microscopy of materials, Boston, Massachusetts, USA, 3 Dec 1987).

Oblique incidence magnetic thin film are considered to be the most appropriate recording media for the next generation of video tape applications. In order to study the microstructure of such thin films, a specimen preparation technique employing ultramicrotomy has been developed. Because oblique incidence thin films have a porous structure and poor adhesion to the substrate, the problem of splitting of the thin films from the substrate is severe. This problem is reduced considerably by the following exercises: using an acrylic embedding resin e.g. LR White, thorough degreasing with solvents, using a 55^0 diamond knife and trimming the block with a microtome before actual sectioning. The details of this preparation technique and some results obtained with this technique are presented.

36686 Preparation of semiconductor cross sections by cleaving. Hetherington, C.J.D. (National Center for Electron Microscopy, Lawrence Berkeley Lab., Univ. of California, Berkeley, CA (US)). v.v of Specimen preparation for transmission electron microscopy of materials. Bravman, J.C.; Anderson, R.M.; McDonald, M.L. Materials Research Society, Pittsburgh, PA (1988). (CONF-871297–: Symposium on specimen preparation for transmission electron microscopy of materials, Boston, Massachusetts, USA, 3 Dec 1987).

The practical details are presented for preparing cross-sectional samples of semiconductor epitaxial layers by cleaving. Examples of results are shown and a number of possible applications for the samples are discussed. A variation of the method can be used to prepare a TEM sample of a high T_c superconductor.

36687 The use of glass slides for preparing cross-section TEM samples of discrete transistors. Cowden, W.G. (Dept. of Chemical and Nuclear Engineering, Univ. of New Mexico, Albuquerque, NM (US)); Datye, A.K. v.v of Specimen preparation for transmission electron microscopy of materials. Bravman, J.C.; Anderson, R.M.; McDonald, M.L. Materials Research Society, Pittsburgh, PA (1988). (CONF-871297–: Symposium on specimen preparation for transmission electron microscopy of materials, Boston, Massachusetts, USA, 3 Dec 1987).

A procedure for preparing cross-section samples of specific regions on an integrated circuit die is outlined. The procedure involves the use of glass slabs to prepare the sample stack used for cross-sectioning. The transparent glass slabs on the top surface of the die enable monitoring of the region of interest during the thinning process. This ensures that the region of interest is located in the electron-transparent section used for TEM imaging. Samples prepared using this technique are sturdy enough to survive successive thinning and observation in a TEM. The glass slides do not give any charging problems and generally thin much slower than the silicon so as to provide added stability to the sample. An additional advantage is that the sample thickness can be accurately measured using the vernier attachment on an optical microscope during the sample thinning process. The imaging of specific NMOS transistors fabricated on buried oxide layers is illustrated.

36688 Preparation of zeolites for TEM using microtomy. Csencsits, R. (Center for Advanced Materials, Materials and Chemical Sciences Div., Lawrence Berkeley Lab. (US)); Gronsky, R. v.v of Specimen preparation for transmission electron microscopy of materials. Bravman, J.C.; Anderson, R.M.; McDonald, M.L. Materials Research Society, Pittsburgh, PA (1988). (CONF-871297–: Symposium on specimen preparation for transmission electron microscopy of materials, Boston, Massachusetts, USA, 3 Dec 1987).

The application of microtomy to Transmission Electron Microscopy (TEM) specimen preparation of zeolite catalysts is explained. Using a new acrylic resin (LR White) thin section ($\leq$60 nm) may be cut with relative ease. Although the details described are specific to catalysts, microtomy and the use of acrylic resin are applicable to any hard ceramic powder sample.

36689 Breathing mode lattice relaxation associated with carrier emission and capture by deep electronic levels in silicon. Samara, G.A. (Sandia National Labs., Albuquerque, NM (US)). v.v of Defects in electronic materials. Stavola, M.; Pearton, S.J.; Davies, G. Materials Research Society, Pittsburgh, PA (1988). (CONF-8711157–: Symposium on defects in electronic materials, Boston, Massachusetts, USA, 30 Nov - 1 dec 1987).

The breathing mode (volume) lattice relaxations associated with carrier emission and capture are evaluated for a variety of deep levels in silicon using a recently proposed method based on high pressure measurements of the emission rates and capture cross sections. Included are (1) the vacancy-like acceptor levels associated with the oxygen-vacancy pair (or A-center) and the gold, platinum and palladium impurities, (2) the chalcogenide donors in their singly- and doubly-charged states and (3) a number of 3d transition metal donors. The signs and magnitudes (which range from –0 to $5A^3$/emitted carrier) of these relaxations are discussed in terms of models for the impurities and defects responsible for the associated levels. The results on the chalcogenides are compared with recent theoretical calculations.

36690 Depth-dependent character of extended defects in ion-implanted and RTA'd Si. Herring, R.A. (Martin Marietta Labs., 1450 South Rolling Road, Baltimore, MD (US)). v.v of Defects in electronic materials. Stavola, M.; Pearton, S.J.; Davies, G. Materials Research Society, Pittsburgh, PA (1988). (CONF-8711157–: Symposium on defects in electronic materials, Boston, Massachusetts, USA, 30 Nov - 1 dec 1987).

The character of extended defects formed in high-energy S-ion implanted and rapid thermal annealed (RTA'd) Si has been found by transmission electron microscopy (TEM) to be dependent on the depth at which the defects have formed in the ion-implanted regions. Si implanted with 6 MeV S-ions and RTA'd at 1000^0C for 10 s showed a buried layer of extended defects with unfaulted loops towards the top and faulted loops towards the bottom. At higher S fluences, all the loops were unfaulted, some loops coalesced to form a dislocation network, and SiS precipitates were formed. At higher RTA temperatures, all the looper were unfaulted. A few possibilities that could explain the difference in defect character are discussed.

36691 Hexagonal silicon. Pirouz, P. (Dept. of Materials Science and Engineering, Case Western Reserve Univ., Cleveland, OH (US)); Chaim, R.; Dahmen, U. v.v of Defects in electronic materials. Stavola, M.; Pearton, S.J.; Davies, G. Materials Research Society, Pittsburgh, PA (1988). (CONF-8711157–: Symposium on defects in electronic materials, Boston, Massachusetts, USA, 30 Nov - 1 dec 1987).

It is shown that indentation-induced formation of hexagonal silicon at the temperature range 400-700^{0}C is fully consistent with its occurence via a martensitic transformation. After presenting HREM images of hexagonal ribbons in a diamond cubic matrix, a crystallographic analysis of the phase transformation is given, and a dislocation mechanism responsible for the transformation is discussed.

36692 Interactions of implanted carbon with oxygen and nitrogen in silicon. Stein, H.J. (Sandia National Labs., Albuquerque, NM (US)). v.v of Defects in electronic materials. Stavola, M.; Pearton, S.J.; Davies, G. Materials Research Society, Pittsburgh, PA (1988). (CONF-8711157–: Symposium on defects in electronic materials, Boston, Massachusetts, USA, 30 Nov - 1 dec 1987).

Carbon has been implanted into Si to overlap implanted concentrations of oxygen and nitrogen. Impurity incorporation and interactions produced by implantation at 50^{0}C, and upon subsequent annealing to 900^{0}C, were monitored by infrared absorption. Implantation with O and C introduces absorption bands for C-O centers in addition to those for substitutional C, interstitial O, and O-vacancy centers. These centers are removed by annealing. The major effect of C in N-implanted layers is a suppression of absorption bands associated previously with N aggregates. There is, apparently, a strong interaction between C and displacement defects which can alter defect reordering and control the loss of C from substitutional sites.

36693 Specimen cage modification for TEM in-situ shearing. Meike, A. (Earth Sciences Div., Lawrence Berkeley Lab., Univ. of California Berkeley, CA (US)). v.v of Specimen preparation for transmission electron microscopy of materials. Bravman, J.C.; Anderson, R.M.; McDonald, M.L. Materials Research Society, Pittsburgh, PA (1988). (CONF-871297–: Symposium on specimen preparation for transmission electron microscopy of materials, Boston, Massachusetts, USA, 3 Dec 1987).

In-situ strain experiments with the electron microscope have contributed substantially to our understanding of deformation in metals and ceramics. However, physical characteristics of rock-forming minerals limit the direct application of experimental procedures developed for metals. The minerals muscovite ($KAl_2(Si_3Al)O_{10}(OH,F)_2$) and biotite ($K(Mg_{0.6-1.8}Fe_{2.4-1.2})(Si_3Al)O_{10}(OH,F)_2$) are chosen to develop techniques for preliminary deformation experiments. The present communication describes modifications of sample preparation techniques for micas. The standard tensile straining configuration is altered to a simple shear geometry by means of an intermediary specimen cage to allow the use of a more favorable sample orientation. The extension of the shearing geometry to the in-situ deformation of other rock-forming minerals is discussed.

36694 Effects of carbon concentration upon oxygen precipitation in Cz Si. Hahn, S. (Siltec Silicon, Menlo Park, CA (US)); Arst, M.; Ritz, K.N.; Shatas, S.; Rek, Z.U.; Tiller, W.A.; Stein, H.J. v.v of Defects in electronic materials. Stavola, M.; Pearton, S.J.; Davies, G. Materials Research Society, Pittsburgh, PA (1988). (CONF-8711157–: Symposium on defects in electronic materials, Boston, Massachusetts, USA, 30 Nov - 1 dec 1987).

Effects of high carbon concentration upon oxygen precipitate formation in Cz silicon have been investigated by combining various furnace and rapid thermal anneals. Even though oxide precipitate density increases with increasing carbon levels, C_s, synchrotron radiation section topographs of processed high carbon content wafers (Cs – 4 ppma) exhibit Pendellosung fringes, indicating a strain free bulk state. Our optical microscopic data have also shown very few detect etch features inside the bulk. A model based upon a direct coupling of both SiO_2 and Si-C complex formation reactions is used to explain rather unique oxygen precipitation characteristics in the high carbon content Cz Si materials.

36695 The structure of the boron-hydrogen complex in silicon. Marwick, A.D. (IBM T.J. Watson Research Center, Yorktown Heights, NY (US)); Oehrlein, G.S.; Barrett, J.H.; Johnson, N.M. v.v of Defects in electronic materials. Stavola, M.; Pearton, S.J.; Davies, G. Materials Research Society, Pittsburgh, PA (1988). (CONF-8711157–: Symposium on defects in electronic materials, Boston, Massachusetts, USA, 30 Nov - 1 dec 1987).

Channeling and lattice location has been used to investigate the structure of the boron-hydrogen complex in crystalline silicon. The positions of both the boron and hydrogen atoms have been determined. The results are compared with Monte-Carlo simulations. The boron atom in the B-H pair is found to be displaced from a substitutional site by 0.28±0.03A, while the hydrogen atom is predominantly at a bond-center site, with a small proportion in a back-bonded position.

36696 Optical reflectance studies of $C_{24}K$ and $C_{24}K(NH_3)$. Hoffman, D.M. (Univ. of Kentucky, Lexington, KY (US)); Rao, A.M.; Doll, G.L.; Eklund, P.C.; York, B.R.; Solin, S.A. v.v of Graphite intercalation compounds. Eklund, P.C.; Dresselhaus, M.S.; Dresselhaus, G. Materials Research Society, Pittsburgh, PA (1984). (CONF-841157–: Materials Research Society annual meeting, Boston, Massachusetts, USA, 26-29 Nov 1984).

In 1954 the synthesis of the potassium-ammonia GIC's was reported. These ternary compounds are now being studied extensively because of recent observations of staging transitions and tuneable intercalate layer thickness associated with variable concentrations of NH_3 in the intercalate layer. The stage n ternary GIC's $C_{24n}K(NH_3)_x$ (n=1,2,3) can be prepared by the reaction of the stage n+1 binary GIC's $C_{24n}K$ with the vapors of NH_3. In this paper the authors report the results of optical reflectivity studies on the NH_3-saturated stage 1 ternary and $C_{24}K$ in the photon energy range 0.4-6 eV. The data were analyzed via Kramers-Kronig analyses to separate intra- and inter-band contributions to the dielectric function. By comparison of the optical results obtained for the binary and ternary GIC's the authors were able to determine the change in charge transfer between the intercalate and carbon layers induced by the NH_3-intercalation. Since the carbon layers in $C_{24}K(NH_3)$ are separated by 6.63 A the authors anticipate only weak C-C interlayer coupling. The data are therefore also discussed in terms of the quasi-2D model applied previously to acceptor GIC's.

36697 Absolute pressure derivatives of deep level defects in III-V semiconductors. Nolte, D.D. (Center for Advanced Materials Lawrence Berkeley Lab. and Univ. of California, Berkeley (US)); Walukiewicz, W.; Haller, E.E. v.v of Defects in electronic materials. Stavola, M.; Pearton, S.J.; Davies, G. Materials Research Society, Pittsburgh, PA (1988). (CONF-8711157–: Symposium on defects in electronic materials, Boston, Massachusetts, USA, 30 Nov - 1 dec 1987).

Based on transition metal reference levels, we present absolute pressure derivatives for band-edges in GaAs and InP and defects in GaAs. The defect deformation potentials are directly related to the electron-lattice coupling which drives lattice relaxation around the defects. The authors find an exceedingly large inward lattice relaxation of the EL2 defect in GaAs upon electron emission.

36698 Fermi level stabilization in semiconductors. Walukiewicz, W. (Center for Advanced Materials, Lawrence Berkeley Lab., Univ. of California, 1 Cyclotron Road, Berkeley, CA (US)). v.v of Defects in electronic materials. Stavola, M.; Pearton, S.J.; Davies, G. Materials Research Society, Pittsburgh, PA (1988). (CONF-8711157–: Symposium on defects in electronic materials, Boston, Massachusetts, USA, 30 Nov - 1 dec 1987).

The authors propose the existence of a Fermi level stabilization energy in III-V semiconductors which provides a reference level for the electronic part of defect annihilation energies. It is shown that the position of the stabilization energy with respect to the band edges determines the maximum free carrier concentration which can be obtained through doping. The proposed model accounts for previously unexplained trends in implant activation efficiency in III-V semiconductors.

36699 Lattice relaxation of the DX centers in $Ga_{1-x}Al_xAs$ and of the pressure-induced deep donors in GaAs. Li, M.F. (Dept. of Physic, Univ. of California, Berkeley, CA (US)); Shan, W.; Yu, P.Y.; Hansen, W.L.; Weber, E.R.; Bauser, E. v.v of Defects in electronic materials. Stavola, M.; Pearton, S.J.; Davies, G. Materials Research Society, Pittsburgh, PA (1988). (CONF-8711157–: Symposium on defects in electronic materials, Boston, Massachusetts, USA, 30 Nov - 1 dec 1987).

Deep Level Transient Spectroscopies (DLTS) and capacitance transient techniques have been applied to GaAs:Si and to

$Ga_{1-x}Al_xAs$:Te (x=0.35) under quasi-hydrostatic pressure using a diamond anvil cell. By substituting the experimental pressure coefficients of the defect energies into a model proposed, the authors concluded that both the DX center in the GaAlAs alloy and the pressure-induced deep donor (PIDD) in GaAs have large lattice relaxations associated with them.

36700 Pressure-dependent DLTS experiments on Si-doped AlGaAs. Farmer, J.W. (Univ. of Missouri Research Reactor Facility, Research Park, Columbia, MI (US)); Hjalmarson, H.P.; Samara, G.A. v.v of Defects in electronic materials. Stavola, M.; Pearton, S.J.; Davies, G. Materials Research Society, Pittsburgh, PA (1988). (CONF-8711157–: Symposium on defects in electronic materials, Boston, Massachusetts, USA, 30 Nov - 1 dec 1987).

Pressure dependent Deep Level Transient Spectroscopy (DLTS) experiments are used to measure the properties of the deep donors (DX-centers) responsible for the persistent photoconductivity effect in Si-doped AlGaAs. The sample dependence of the DLTS spectra shows evidence for a defect complex involved in the DX-center.

36701 A comparison of fatigue crack propagation in Modes I and III. Ritchie, R.O. (Materials and Chemical Sciences Div., Lawrence Berkeley Lab., Univ. of California, Berkeley, CA (US)). v.v of Proceedings of the eighteenth national symposium on fracture mechanics. Read, D.T.; Reed, R.P. ASTM, Philadelphia, PA (1988). (CONF-850679–: 18. American Society for Testing and Materials national symposium on fracture mechanics, Boulder, Colorado, USA, 25-27 Jun 1985).

The propagation behavior of fatigue cracks in Mode III (anti-plane shear), measured under cyclic torsion, is described and compared with more commonly encountered behavior under Mode I (tensile opening) loads. It is shown that a unique, global characterization of Mode III growth rates, akin to the Paris law in Mode I, is only possible if characterizing parameters appropriate to large-scale yielding are employed and allowance is made for crack tip shielding from sliding crack surface interference (that is, friction and abrasion) between mating fracture surfaces. The magnitude of this interference, which is somewhat analogous to crack closure in Mode I, is further examined in the light of the complex fractography of torsional fatigue failures and the question of a fatigue threshold for Mode III crack growth. Finally, micromechanical models for cyclic crack extension in anti-plane shear are briefly described, and the contrasting behavior between Mode III and Mode I cracks subjected to simple variable amplitude spectra is examined in terms of the differing role of crack tip blunting and closure in influencing shear, as opposed to tensile opening, modes of crack growth.

Some historical facts about the construction of a periodic system of chemical elements are reviewed. The Madelung rule is used to generate an unusual format for the periodic table. Following the work of Byakov, Kulakov, Rumer and Fet, such a format is further refined on the basis of a chain of groups starting with SU(2)xS0(4.2).

36704 (CEGB-TPRD/L–3259/R88) **Determination of boron as boric acid by automatic potentiometric titration.** Midgley, D. Central Electricity Research Labs., Leatherhead (UK). Jun 1988. 16p. (PWR/ASG/P–87-9). Order Number DE89617891/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Boron in PWR primary coolant and related waters may be determined as boric acid by titration with sodium hydroxide, using a glass electrode as a pH indicator. With a modern automatic titrator, the analysis is quick, convenient, accurate and precise. In the titration of 8 mg B (e.g. 4 ml of 2000 mg l^{-1} solution), no significant bias was observed and relative standard deviations were about 0.25%. With 0.8 g B, a bias of about 2% appears, although this could be reduced by restandardizing the titrant, but the relative standard deviation was still < 0.5%. The lithium hydroxide added to primary coolant would cause a negative bias, but a simple correction may be applied using the routinely determined lithium concentration. The titrator is, therefore, suitable for routine use in a PWR station, where the primary coolant contains 100-2000 mg l^{-1} B, depending on the stage of the fuel cycle.

36705 (CNIC–00231) **Determination of trace gold in rocks and minerals by neutron activation analysis.** Zhao Yunlong; Zhou Suqing; Liang Yutang. China Nuclear Information Centre, Beijing, BJ (China). May 1988. 8p. (In Chinese). (BUGRI–0004). Order Number DE89613061/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

The determination of trace gold in rocks and minerals by neutron activation analysis is described. Two methods are used for pre-separating and concentrating the trace gold in geological samples. one of the methods is that the samples are dissolved in aqua regia solution; activated carbon paper pulp filter is used for pre-separating and concentrating trace gold by dynamic adsorption method; then the activated carbon containing gold was ashed at 650 ~ 700 deg c. The other method is that the samples are dissolved in aqua regia solution; the polyurethane foam plastic filled with activated carbon is used for pre-separating and concentrating trace gold by dynamic adsorption method; then the foam plastic containing gold was ashed at 650 deg c. The gold in ashes is determinated by neutron activation analysis. The detection limit is 0.004ng/g. The accuracy of the method is examined by gold in reference standard material. The results of this method are in good agreement with the recommended value. For analysis of the trace gold by the methods of instrumental neutron activation analysis and epithermal neutron activation analysis, the interference of 411.8 keV γ-ray from ^{153}Sm, ^{152}Eu and fission products of uranium and the correction methods are discussed.

36706 (CONF-851011–10) **Electrically stabilized expanded beds for sorption separations.** Watson, J.S.; Byers, C.H.; Reinholt, D.R. Oak Ridge National Lab., TN (USA). 1985. 14p. Sponsored by DOE Energy Research. DOE Contract AC05-84OR21400. From 4. symposium on separation science and technology for energy applications; Knoxville, Tennessee, USA; 20-24 Oct 1985. Order Number DE89014192/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Recent studies have shown that when high electric fields are imposed on expanded fluidized beds, motion of the particles can cease. This provides the potential for fixed bed operations with the void fraction sufficiently large that only moderate pressure drops are required, even with small particles. This paper explores the dielectric forces that inhibit particle motion in alternating-current electric fields and the potential and limitations of the concept for adsorption operations. The dielectric constants of the particles and the fluid, the size of the particles, the density and viscosity of the fluid, and the imposed electric field gradient are the variables of most importance to bed stabilization. In adsorption tests, the expanded-stabilized beds perform essentially as well as densely packed fixed beds but with only a fraction of the pressure drop. 9 refs., 6 figs.

Work continued on ion chromatography. The following research areas are discussed: (1) fluorogenic ligands, chelating surfactants and metal determinations. The use of sulfoxines in fluorescence detection is addressed. Chromatographic detection of Al, Ga, and In was undertaken. (2) Membrane suppressers; (3) A novel suppresser reaction and detection of weak acids via indicators reactions, and (4) DC "conductivity" detection and stopped flow chromoamperomety. 18 refs., 2 figs. (CBS)

36708 (INIS-BR–1542) **Deformations in structure of the scapolites from northeast, Brazil.** Gouveia, A.H.C.; Villarroel, H.S. Sociedade Brasileira de Geologia, Recife, PE (Brazil). Nucleo do Nordeste. 1979. 12p. (In Portuguese). (CONF-7911203–: 9. symposium of geology in northeast, Natal, Brazil, Nov 1979). Order Number DE89619123/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Scapolites are relatively common constituents of calcium-rich metamorphic rocks. They can be considered as members of the solid solution series marialite and meionite. Relationship between the optical properties, chemical composition and X-ray diffraction data shows that scapolites from northern Brazil are mizzonites and meionites. The structures of these minerals are compatible only with a primitive lattice. The d_{hkl} peaks of natural scapolites are outside the range shown by the two pure end-members of the series, and the unit-cell dimensions increase with percentage of $(K+SO_4)$. X-ray diffraction powder data for natural tetragonal and orthorhombic calcium-rich scapolites are detailed in five tables.

36709 (INIS-BR–1544) **Petrology and mapping of Fe and Ti occurences in Passira country, PE, Brazil.** Silva Filho, A.F. da; Pinho Guimaraes, I. de. Sociedade Brasileira de Geologia, Recife, PE (Brazil). Nucleo do Nordeste. 1979. 8p. (In Portuguese). (CONF-7911203–: 9. symposium of geology in northeast, Natal, Brazil, Nov 1979). Order Number DE89619125/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

The results of a geologic mapping realized at the scale of 1:25.000, for graduating in geology, the will show in this communication. The area mapped has 230 square kilometers and it is localized between the south lattitudes of $7^0$52'30" and $8^0$42'45" and the west greenwiches of $35^0$26'49" and $35^0$33'30", at the districts of Passira and Limoeiro-PE. At the area, are recorgnized migmatites granites, biotite schists, hornblende-gneisses, quartz-diorites and amphigolites. The iron titanium ore are fitted, like xenoliths, inside the amphibolites. The amphibolites have orthorocks type, and they are derived predominatly of the quartz-diorite unit, where they may be individualized cartographicaly. On the other side of the geological mapping, we did many thin sections and polished, chemical analyses of the ore bodyes, and the results will be disciminated.

Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Methods of IR- and NMR-spectroscopy, measurement of electric conductivity were used to study the solvent extraction of metal microamounts in thre presence of macroamounts of other elements. Dissociation constants of different trioctylalkyl and trioctylammonium complexes (including Er, Th, In complexes) in benzene and nitrobenzene were calculated. The equation, which enables to make allowance for the character of influence of all factors o microelement behaviour in macroelement presence during extraction by amines and quaternary ammonium salts, was derived. Analysis of the equation shows, that the degree of suppression of microelement extraction grows with increase of concentration of alkylammonium common ion, macroelement concentration and its dissociation constant in organic phase. 2 refs.; 3 tabs.

36717 (INIS-SU–97, pp. 135-137) **Determination of thermodynamic characteristics of extraction equillbria in the systems containing ammonium salts and organic phosphorus compounds.** Sedov, V.M. (Leningradskij Tekhnologicheskij Inst., Leningrad (USSR)); Kopyrin, A.A.; Proyayev, V.V.; Burtsev, I.A. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Consideration is being given to empirical methods of calculation and mathematical models, enabling to describe rather simple and precisely a thermodynamic equilibrium in extractive systems based on alkylammonium salts and organicophosphorus compounds. It is shown that Pitzer's and Mikulin's methods are the most suitable ones for calculation of thermodynamic activity of components in aqueous phase. The organic phase can be described most precisely by the ideal associative solution model, which takes into account the difference of association constants and additional solvation of metal-containing complex by extractant molecules. Equations for calculating association constants of tributylphosphate (TBP) and alkylammonium salts in organic solvents are given; values of additional solvation constants are presented for the following systems: $M(NO_3)_n$-TBP-benzene (where M=Ce^{3+}, Pr^{3+}, UO_2^{2+}, Th^{4+}; n=2, 3, 4) and Ce(Eu)$(NO_3)_3$-TLAcenter dotHNO_3-CCl_4, where TLAcenter dotHNO_3 - trilaurylammonium nitrate. 6 refs.

36718 (INIS-SU–97, pp. 206-208) **Extraction properties of TBP - uranyl nitrate disolvate.** Zilberman, B.Ya. (Radievyj Inst., Leningrad (USSR)); Fedorov, Yu.S. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

A study was made on solvent extraction of actinides (Pu, Np, Th, U) and F^-, Cl^-, Br^-, N_3^-, SCN^- anions in the system: aqueous nitric acid solution of uranyl nitrate (UN) in the presence of solid UN salt -tbp solution in CCl_4 at 20 deg C. It is shown that TBP-UN disolvate exhibits some specific extraction properties. Distribution coefficients of anions (F^-, Cl^-, Br^-, N_3^-, SCN^-) are much higher in the presence of UN, than in its absence. Investigation of UN salting-out properties shows that the ratio of distribution coefficients of plutonium and uranium during solvent extraction from uranium-magnesium systems with the steady salting-out effect and in solvent extraction from systems without $Mg(NO_3)_2$ is practically the same in all studied range. It is proposed, that anion-exchange properties of tbp-UN disolvate lead to actinide solvent extraction in the form of anion complexes. 3 refs.; 4 figs.

Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Extraction ability of various amides was studied. Data on extraction of rare earths, vanadium, molybdenum, rhenium, uranium, niobium, tantalum by N,N-dibutyl-amides of acetic, nonanic acids and fatly synthetic acids of C_7-C_9 fractions are presented. Effect of salting-out agents, inorganic acid concentrations on extraction process was studied. Potential ability of using amides of carboxylic acids for extractional concentration of rare earths as well as for recovery and separation of iron, rhenium, vanadium, molybdenum, uranium, niobium, and tantalum was shown. 5 refs.; 3 figs.; 2 tabs.

36720 (Juel-Spez–475) **Activation analysis of air particulate matter.** Alian, A.; Sansoni, B. Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Zentralabteilung fuer Chemische Analysen. Nov 1988. 106p. Order Number DE89788344/JAW. Available from NTIS (US Sales Only), PC A06/MF A01.

This review on activation analysis of air particulate matter is an extended and updated version of a review given by the same authors in 1985. The main part is aimed at the analytical scheme and refers to rules and techniques for sampling, sample and standard preparation, irradiation and counting procedures, as well as data processing, - evaluation, and - presentation. Additional chapters deal with relative and monostandard methods, the use of activation analysis for atmosphere samples in various localities, and level of toxic and other elements in the atmosphere. The review contains 190 references.

Substances existing in the starting material for production of silicon crystals are responsible for part of the impurities in the resultant silicon crystals while the remaining of the impurities are accounted for by substances entering the material during the production of semiconductor devices. It is of great importance to make an analysis of impurities contained in the original crystal material. Such crystal material is so high in purity that a quantitative analysis technique to be used should be able to determine ppt-level impurities. The present report outlines the mechanism of an neutron activation analysis method which can be applied to the determination of impurities in crystal material. When a sample for analysis is fed into a nuclear reactor, neutrons resulting from the fission of ^{235}U hit nuclei to cause nuclear reactions, to convert the nuclei into different forms of nuclei. Such product nuclei are generally radioactive and disintegrate into daughter nuclei while releasing beta- and gamma-rays. The types and amount of elements contained in the original sample can be identified and determined by analyzing the energy of the released gamma-rays. (N.K.).

The report outlines the measuring mechanism of SIMS and its applications in the field of semiconductor production. SIMS is the only equipment currently available for micrometer-order analysis and ppb-level impurities detection required for evaluation of semiconductors. In SIMS, sputtering of the sample surface is performed with primary ions and the secondary ions released from the sample are analyzed to identify the atomic species existing in the surface. The sputtering process and ionization process are outlined in the report, though the details of sputtering has not been fully clarified yet. In actual observation, some problems may be caused due to interfering ions and residual ions. In general, various ions including multi-valent ions, cluster ions, molecular ions, hydrogenated/oxygenated ions and hydrocarbon ions are produced in addition to monovalent ions to interfere the atoms under analysis. Interference by these ions can cause serious problems in carrying out depth profile analysis as well as observation of mass spectra. Major applications of SIMS in the field of semiconductor production include the evaluation of silicon surface, light elements, insulating materials and semiconductor devices. Some requirements to be met by further studies are also listed. (N.K.).

36724 (KURRI-TR–302, pp. 67-73) **Techniques for utilization of nuclear reactor neutrons for semiconductor research. Current situation and problems to be solved in future.** Kimura, Itsuro (Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst.). Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst. May 1988. (In Japanese). (CONF-8707203–: Specialist research meeting on semiconductors with research reactors; Specialist research meeting on semiconductors with research reactors, Kyoto, Japan; KUMATORI, Japan, 27 Jul 1987; 18 jan 1988;CONF-8801165–). In *Proceedings of the specialist research meetings on semiconductors with research reactors.* Order Number DE89003365/JAW. Available from NTIS (US Sales Only), PC A05/MF A01.

The report outlines various techniques to utilize neutrons obtained from a nuclear reactor in the area of semiconductor research, focusing on the current research situation and problems to be solved in the future. For research on the interaction between neutrons and semiconductors, data on nuclei used in semiconductors are essential, and transport of neutrons in semiconductors has significance in conversion-injection of neutrons. For research of the neutron field in a nuclear reactor, investigations are required for tailoring, control of irradiation environment, production and control of fine beams, and production and control of pulsed beams. For detailed analysis of impurities, investigations have been or should be carried out for nuclear activation analysis, prompt gamma-ray analysis, tracer techniques, detection of reaction particles, and measurement of detailed distribution. For analysis of structures and chemical forms, techniques have been and should be developed for neutron diffraction, small angle scattering of neutrons, inelastic scattering of neutrons, and application of Moessbauer effect to study on local structures in amorphous material. (N.K.).

36725 (LBL–24944) **Separation of low molecular weight alcohols from dilute aqueous solutions by reversible chemical complexation.** Arenson, D.R.; King, C.J. Lawrence Berkeley Lab., CA (USA). Apr 1989. 208p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract AC03-76SF00098. Order Number DE89014159/JAW. Available from NTIS, PC A10/MF A01 - OSTI; GPO Dep.

Thesis. Submitted by D.R. Arenson.

The removal of alcohols from dilute solutions has traditionally been performed by distillation. Since this is an energy intensive process, a large amount of the total processing cost is due to the separation and purification of the alcohol. As an alternative to distillation, extraction is investigated from both a process and a chemistry point of view for several alcohols. The goals of the project were to find effective solvent systems for removal of alcohols and to investigate the interactions occurring in the organic phase during extraction. Ethanol was examined both as a model compound and because of the interest in its production by fermentation. The four butanols were extracted in order to investigate the differences in extraction of the various isomers. Several propanols and propanediols were used also. Phenols were found to provide much higher distribution ratios for extraction of ethanol than do other common solvents. In extracting the butanol isomers it was found that the indicated activity coefficients in the organic phase were approximately the same when large concentrations of m-cresol were present. A mass-action-law model was used to obtain indicated stoichiometries for the complexes formed in the organic phase between the alcohol and m-cresol. From the complex formation constants at different temperatures, the enthalpy of complex formation was calculated for the interaction between ethanol and m-cresol. 101 refs., 75 figs., 13 tabs.

36726 (LBL–27166) **Channelling and related effects in electron microscopy: The current status.** Krishnan, K.M. Lawrence Berkeley Lab., CA (USA). May 1989. 35p. Sponsored by DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-8905179–2: 8. Pfefferkorn conference on fundamental beam interactions with solids for microscopy, microanalysis and microlithography, Park City, UT, USA, 7-12 May 1989). Order Number DE89014897/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Channelling or Borrmann effect in electron diffraction has been developed into a versatile, high spatial resolution, crystallographic technique with demonstrated applicability in solving a variety of materials problems. In general, either the characteristic x-ray emissions or the electron energy-loss intensities are monitored as a function of the orientation of the incident beam. The technique, as formulated in the planar geometry has found wide applications in specific site occupancy and valence measurements, determination of small atomic displacements and crystal polarity studies. For site occupancy studies, the appropriate orientations in most cases can be determined by inspection and the analysis carried out according to a simple classification of the crystal structure discussed in this paper. Concentration levels as low as 0.1 wt% can be easily detected. The reciprocity principle may be used to advantage in all these studies, if electron energy-loss spectra are monitored, as both the channelling of the incoming beam and the blocking of the outgoing beam are included in the formulation and analysis. The formulation in the axial geometry is an useful alternative, particularly for monatomic crystals. Localization effects are important if, either the experiment is performed in the axial geometry or if low atomic number elements ($z < 11$) are detected. In general, the sensitivity to L-shells is lower compared to K-shell excitations. Other experimental parameters to be considered include temperature of the sample, the acceleration voltage and parallelism of the incident beam. Any detrimental effects of channelling on conventional microanalysis can be minimized either by tilting the crystal to an orientation where no lower order diffraction vectors are excited or by using a convergent probe such that a large range of incident beam orientations are averaged in the analysis. 49 refs., 9 figs.

36727 (MLM–3596) **An efficient palladium isotope chromatograph (EPIC) for hydrogen.** Rutherford, W.M. EG and G Mound Applied Technologies, Miamisburg, OH (USA). 20 Jun 1989. 16p. Sponsored by DOE Defense Programs. DOE Contract AC04-88DP43495. Order Number DE89014581/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The efficient palladium isotope chromatography (EPIC) system is based on a palladium displacement chromatograph developed and tested for the preparative scale separation of the isotopes of hydrogen. Rapid cycling and high efficiency are obtained by use of high-performance packing operating at an elevated temperature (80°C) and elevated pressure (1.5 atm). The process, which was tested with a 50/50 mixture of hydrogen and deuterium, depends on the exploitation of thermally driven pressure differences to recover and recycle the mixed transition zone between the bands of the pure components and also to recover and recycle the hydrogen gas used as the displacing agent. The purity of the product is significantly enhanced by partially backfilling the column with pure

deuterium at the beginning of each displacement cycle. The computer-controlled system operates continuously, and it is capable of separating 2.2 std L/hr of feed at product assays of 99.86 at. % hydrogen and 99.992 at. % deuterium. 11 refs., 5 figs., 1 tab.

36728 (NRCC/IMR–27559) **Determination of the nature and content of antioxidant and antioxidant synergist in PE and XLPE used in cables.** Crine, J.-P.; Haridoss, S.; Cole, K.C. National Research Council of Canada, Boucherville, PQ (Canada). Industrial Materials Research Inst.; Institut de Recherche d'Hydro-Quebec, Varennes, PQ (Canada). [1989]. 21p. (MICROLOG–89-00557). Available from Canada Institute for Scientific and Technical Information, Montreal Rd., Ottawa, ON, Canada K1A 0S2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

It is shown that polyethylene (PE) and cross-linked PE used for high-voltage electric cable applications contain an antioxidant synergist in addition to an antioxidant. Their nature and content have been determined by a combination of spectroscopy and neutron activation analysis measurements. The results thus obtained suggest that part of the antioxidant compound is grafted to polymer chains during crosslinking. A combination of ultraviolet and Fourier transform infrared (FTIR) spectroscopy and neutron activation analysis (or any other technique measuring sulfur) measurements were shown to allow the identification of the two components of the antioxidant compound used in PE resin for cable applications. In fact, the combination of infrared and neutron activation results is the only reliable way to evaluate the antioxidant-compound content in cross-linked PE. Note that this cannot be achieved by a single technique since ultraviolet spectroscopy is useless with cross-linked PE and cannot easily identify synergists; FTIR spectroscopy can identify the antioxidant components in unaged PE but this is much more difficult in aged PE and cross-linked PE; and the sulfur content in cross-linked PE does not give directly the fraction of functional (ungrafted) antioxidant compound. FTIR spectroscopy and neutron activation measurements reveal that the studied samples contain identical (ca 2500 ppM) antioxidant and synergist contents. 11 refs., 7 figs.

36729 (ORNL/FTR–3292) **International conference on analytical chemistry in nuclear technology, June 5–8, 1989, Karlsruhe, France: Foreign trip report.** Stokely, J.R. Oak Ridge National Lab., TN (USA). 19 Jun 1989. 8p. Sponsored by DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89014232/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The traveler attended the Second International Conference on Analytical Chemistry in Nuclear Technology and presented recent ORNL work on chemical and radiochemical analysis to characterize mixed radioactive waste. Invited papers dealt, for the most part, with analytical chemistry in nuclear fuels reprocessing and safeguards and with new analytical techniques of general interest. A wide diversity of subjects were covered in poster sessions. Subjects of particular interest were in-line and on-line process analysis using fiber optic spectrophotometry, x-ray fluorescence, and gamma-ray spectrometry, chemical characterization of radioactive waste, new neutron activation analysis methods, and use of computers and robotics in analytical chemistry laboratories.

Technical Paper NO. 1152.

The authors have studied the reproducibility and bias of the measurements of the column efficiency in HPLC, using simulated peaks. Peaks of various signal to noise and tau/sigma ratios are generated by computer simulation using an exponential convoluted Gaussian model. Tau/sigma is a measure of the asymmetry of a peak, where tau is the time constant for the exponential tailing function with which the Gaussian peak, with a standard deviation of sigma, is convoluted. A noise sequence is added to the peak profile. Signal to noise ratios in the range of 50 to 10^6 are used in this study. The reproducibility of the efficiency values is defined as the relative standard deviation of ten measurements and the bias is the difference between the mean and true value. Since each peak is completely defined by the simulation program user, the true efficiency is known. Among the variables that can influence column efficiency values, the choice of the measurement or calculation method is very often overlooked. This choice can have a dramatic effect on the calculated efficiency values obtained from peaks deviating from the ideal Gaussian profile or those having a noisy baseline, as is commonly the case in chromatography. Column efficiency values from a variety of peaks are computer calculated, using eight commonly employed methods, and are compared.

36731 Optimization of separation efficiency in capillary zone electrophoresis. Jones, H.K. (Chemical Methods and Separations Group, Chemical Sciences Dept., Pacific Northwest Lab., Richland, WA (US)); Nguyen, N.T.; Yonker, C.R.; Smith, R.D. v.v of 1988 Pittsburgh conference and exposition on analytical chemistry and applied spectroscopy (abstracts). Pittsburgh Conference, Pittsburgh, PA (1988). (CONF-880204–: 39. Pittsburgh conference and exposition on analytical chemistry and applied spectroscopy, New Orleans, LA, USA, 22-26 Feb 1988).

Technical Paper NO. 643.

Capillary zone electrophoresis (CZE) is a potentially useful technique for fast, high efficiency separations of biologically important compounds such as amino acids, peptides, amines, nucleic acids, and proteins. To improve separation efficiencies in CZE, fundamental studies of the variances contributing to band-broadening and of the effects of physical and chemical parameters are required. These parameters include applied voltage, column length, column radius, injection time, pH and ionic strength of the buffer. Many such studies have been reported by Jorgenson and coworkers, but important contributions to band-spreading remain unresolved. The band-broadening in capillary zone electrophoresis can be attributed to a range of factors. The most important factors are expected to be sample specific adsorption phenomena, local perturbation of electric field strengths, sample volume, detector volume, thermal heating, and molecular diffusion. The minimization of these contributions is required to exploit the significant potential of CZE. In this study, variances contributing to the band-broadening in CZE have been investigated in fused silica capillaries with on-line fluorescence and U.V. absorption detectors.

36732 Numerical simulation of band profiles for two-component separations by displacement chromatography. Katti, A.M. (Oak Ridge National Labs., Analytical Chemistry Div., Oak Ridge, TN (US)); Guiochon, G. v.v of 1988 Pittsburgh conference and exposition on analytical chemistry and applied spectroscopy (abstracts). Pittsburgh Conference, Pittsburgh, PA (1988). (CONF-880204–: 39. Pittsburgh conference and exposition on analytical chemistry and applied spectroscopy, New Orleans, LA, USA, 22-26 Feb 1988).

Technical Paper NO. 1153.

The band profiles for the separation of a two component mixture by displacement chromatography are simulated by solving the mass balance equation for chromatography. Competitive isotherms are employed to account for non-linear effects due to the thermodynamics of solute stationary phase interactions. Fast kinetics are assumed, as well as isothermal operation, and the boundary conditions are adjusted to apply for displacement separations. The potential of displacement chromatography for preparative chromatographic separations is high, due to the formation of the displacement train where adjacent bands move at constant velocity with a minimal amount of peak overlap. The effect of various operating parameters have been investigated and their effect on the product purity and the production rate will be discussed. Additionally, the profiles obtained will be compared with experimental results.

In connection with studies of precipitated iron oxide catalysts for the synthesis of hydrocarbons from carbon monoxide and steam, the changes in pore structure during pretreatment and synthesis reactions were investigated. Precipitated iron oxide catalysts initially contain fine ferric oxide particles built up from spheroidal crystals of different diameters which link to form tubular capillaries with varying widths. Upon CO-steam interaction and subsequent sintering of the catalysts, smoothing of the walls of tubular produces capillaries having ink-bottle shape. Changes in surface areas with crystallite sizes, as determined by x-ray line broadening, are discussed. 12 refs., 6 figs., 3 tabs.

The sorption of hexachloroplatinic acid on variously prepared specimens of alumina has been investigated under equilibrium and kinetic conditions. Relationships between metal dispersibility and sorption are interpreted in terms of interactions with superficial acid-base couple sites on the alumina substrates. 10 refs., 2 figs., 2 tabs.

36735 (BNL–42831) **Superexchange coupling mechanisms for electron transfer processes.** Newton, M.D. Brookhaven National Lab., Upton, NY (USA). 1989. 14p. Sponsored by DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-8905146–1: 22. Jerusalem symposium on quantum chemistry, Jerusalem, Israel, 15-18 May 1989). Order Number DE89013568/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Electron transfer matrix elements for electron exchange between various pairs of transition metal complexes in close contact have been calculated and analyzed for a variety of approach geometries for the two reactants. The coupling between the nominal metal ion donor/acceptor sites is achieved by superexchange of the "hole" type arising from ligand-to-metal charge transfer (LMCT), the dominant ligand-field interaction for the electron-donor ligands considered (H_2O, NH_3, and the cyclopentadienide anion). The pronounced variations of H_{if} with geometry are not correlated with the separation distance of the metal ions (between which the direct overlap is negligible) and span the range from non-adiabatic to strongly adiabatic electronic coupling. The values for metallocene/metallocinium redox pairs bracket recently reported experimental values. Analysis of the results using the method of corresponding orbitals demonstrates the validity of an effective 1-electron model for the electron transfer process to within about 10% for the class of systems considered. A higher-order superexchange mechanism was encountered for the $Co(NH_3)_6^{2+/3+}$ exchange process, in which the LMCT-driven hole-transport mechanism couples excited local states of the metal ions, which in turn are connected to the corresponding ground states by spin-orbit mixing. This mechanism yields on electronic transmission factor within two orders of magnitude of unity. 30 refs., 5 tabs.

36736 (CONF-890792–1) **Infrared study of carbon deposits on catalysts.** Eischens, R.P. Lehigh Univ., Bethlehem, PA (USA). 1989. 9p. Sponsored by DOE Energy Research. DOE Contract FG02-86ER13612. From Worldwide catalysis seminar: successful design of catalysts; Philadelphia, PA, USA; 5 Jul 1989. Order Number DE89013310/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The deposition of carbon on alumina and on catalysts, in which alumina was the support for platinum and rhenium, was followed by simultaneously weighing the total deposit and observing the infrared spectra. At total carbon deposit levels of 1 percent or less, produced by exposure to acetylene at 525 K or ethylene at 625 K, bands were observed near 1580 and 1470 cm^{-1}. Isotopic labeling with oxygen-18 and deuterium shows that these bands are attributable to the asymmetric and symmetric stretching vibrations of a carbon-oxygen species similar to a carboxylate ion. This species involves about one-sixth of the total carbon in deposits on alumina. Platinum does not markedly affect the total carbon or the fraction that is carboxylate. Rhenium does not affect the total carbon but it significantly lowers the carbon-oxygen species. Pretreatment of desulfurization catalysts with ammonia reduces the total carbon by about one-half and almost eliminates carboxylate formation. Carboxylates are not found in carbon deposits on silica. 15 refs., 5 figs.

Our research involves developing general computational methods for predicting the thermodynamic properties of condensed state chemically reactive systems. The overall effort has encompassed both computer studies, and parallel laboratory experimental work to support our evolving computational models. To date, we have demonstrated the soundness of molecular mechanics/force-field techniques for accurate prediction of the thermodynamic properties of chemically reactive systems. We have worked extensively with three molecular mechanics models, Boyd's MOLBD3, Allinger's MMP2 and the Warshel/Lifson/Karplus QCFF/PI program. No one of these programs at present has general full thermodynamic output capability. We are well on the way toward modifying QCFF/PI for such full thermodynamic capability. Our supporting laboratory studies have involved careful bomb calorimetry for ΔH_f^0 information, x-ray structure determination for accurate molecular geometry data, and kinetics/equilibrium determinations for various prototypical Diels-Alder reactions. Vapor pressure studies for candidate Diels-Alder compounds are also underway. The bomb calorimetric and greater initial effort on vapor pressure studies have replaced the original solvent effect and hindered rotation NMR studies planned, on the basis of most critical data needs for correct computational model development. 3 refs.

36740 (DOE/ER/13584–4) **[Dynamics of vibrationally excited polyatomic molecules and their unstable isomers on the electronic ground state potential surface]: Progress report.** Dai, Hai-Lung. Pennsylvania Univ., Philadelphia, PA (USA). Dept. of

Chemistry. 1989. 9p. Sponsored by DOE Energy Research. DOE Contract FG02-86ER13584. Order Number DE89014682/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The general goal of this research is to understand the role of vibrational energy in chemical reactions related to energy production. Since the start of this grant in August 1986, we have made several advancements, both in the development of methodology and in science, toward understanding the chemical properties of highly vibrationally excited molecules. A transient vibrational spectroscopic method – Flash Photolysis Stimulated Emission Pumping – for radical species has been developed. The vibration-rotation levels of a radical, generated by flash photolysis at a concentration $\gtrsim 10^{-4}$ Torr, and with a lifetime of $\gtrsim 10^{-8}$ sec, can be characterized with 0.04 cm^{-1} resolution over a wide energy range (up to 10^4 cm^{-1}). This method was first demonstrated on CH_2. Using Stark Level-Crossing Spectroscopy, we have shown that highly excited, single vibration-rotation quantum states of small polyatomics can be characterized with great detail. This can be done even though these levels are dissociative, have high densities, and are optically inaccessible. 17 refs., 2 figs., 4 tabs.

36741 (DOE/ER/13603--T1) **Study of intermediates from transition metal excited-state electron-transfer reactions: Progress report, August 1, 1986–December 31, 1988.** Hoffman, M.Z. Boston Univ., MA (USA). Dept. of Chemistry. 31 Dec 1988. 20p. Sponsored by DOE Energy Research. DOE Contract FG02-86ER13603. Order Number DE89014694/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

During the period covered by this progress report, the examination of intermediates from transition metal excited-state electron-transfer reactions followed certain well-defined themes; the techniques of conventional and time-resolved spectrofluorimetry, continuous and pulsed laser flash photolysis, and continuous and pulse radiolysis were employed. Research involves Ru(II) complexes and Cr(III) complexes. 23 refs., 2 tabs.

36742 (DOE/ER/72027–T2) **Structure and reactivity of chemisorbed species and reaction intermediates: Progress report, December 1, 1984–November 30, 1985.** Madey, T.E.; Kelley, R.D. National Bureau of Standards, Washington, DC (USA). Surface Science Div. 1 Aug 1985. 9p. Sponsored by DOE Energy Research. DOE Contract AT01-77ER72027. Order Number DE89014113/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The areas of work have supported a common theme: the structure and reactivity of chemisorbed species and reaction intermediate of importance to catalysis. A variety of tools have been to study the structure and chemistry of surface species, and to develop models and concepts of broad utility in chemisorption and catalysis. Adsorption of carbon monoxide, ammonia, hydrogen, and sulfur are discussed. Results of the research conducted or completed in the last year, as well as plans for the coming year, are summarized in this report. The results will be presented in three sections: (a) Surface Molecular Structure and Reactivity as Studied Using Electron Simulated Desorption Ion Angular Distribution (ESDIAD) and High Resolution Electron Energy Loss Spectroscopy (HREELS); (b) Neutron Inelastic Scattering Studies of Adsorption and Reaction on Catalysts; and (c) Reaction Kinetics at High Pressures over Single Crystal Catalysts.

36743 (ETDE-mf–9788064) **Mass spectrometry for investigations into the system lead/oxygen, using the electrochemical Knudsen cell.** Richthofen, A. von. Technische Hochschule Aachen (Germany, F.R.). Fakultaet fuer Bergbau und Huettenwesen. 14 Jul 1987. 79p. (In German). Order Number DE89788064/JAW. Available from NTIS (US Sales Only), PC A05/MF A01.

In this study, the combination of an electrochemical Knudsen cell (EKC) with a quadrupole mass spectrometer (QMS) was successfully used for the first time to determine the thermodynamics of the yellow lead oxide vapour which has a complex composition. The following species could clearly be detected in the vapour of yellow lead oxide: PbO, Pb_2O_2, Pb_3O_3, Pb_4O_4, Pb_5O_5. In particular, Pb_3O_3 was detected in the vapour of yellow lead oxide in spite of the high potential of 12.4 eV required for its occurrence.

36744 (INIS-mf–11457(v.1,2) v. 1) **Experimental verification of the theory of clusters.** Hawrynski, M.J. (Inst. of Occupational Medicine, Lodz (Poland)). Canadian Nuclear Association, Toronto, ON (Canada). 1985. (CONF-841016–: International conference on occupational radiation safety in mining, Toronto, Ontario, Canada, 15-18 Oct 1984). In *Occupational radiation safety in mining. Proceedings of the international conference (in two volumes).* Order Number DE89619926/JAW. Available from NTIS (US Sales Only), PC A99/MF A01 - OSTI; INIS.

Experimental verification of the theory of clusters is described in this paper. The measurements of diffusion coefficient of charged RnDP fraction in various relative humidities of air were done. Dynamic theory of clusters has been proved, whereas the static theory has not.

36745 (INIS-SU–89, pp. 3) **Synthesis and structure of mixed by cation ternary vanadates $Me_2MeLn(VO_4)_2$.** Komissarova, L.N. (Moskovskij Gosudarstvennyj Univ., Moscow (USSR)); Mel'nikov, P.P.; Carillo Heredero, J.D. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

ALKALI METAL COMPOUNDS/chemical preparation; ALKALI METAL COMPOUNDS/crystal structure; RARE EARTH COMPOUNDS/chemical preparation; RARE EARTH COMPOUNDS/crystal structure; VANADATES/chemical preparation; VANADATES/crystal structure; CHEMICAL COMPOSITION; COMPARATIVE EVALUATIONS; MONOCRYSTALS; POLYCRYSTALS; VANADATES

36746 (INIS-SU–89, pp. 3-4) **Electric conductivity of ternary phosphates and vanadates of alkali and rare earth metals.** Mel'nikov, P.P. (Moskovskij Gosudarstvennyj Univ., Moscow (USSR)); Komissarova, L.N.; Karril'o Ehredero, Kh.D. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

ALKALI METAL COMPOUNDS/electric conductivity; ALKALI METAL COMPOUNDS/permittivity; RARE EARTH COMPOUNDS/electric conductivity; RARE EARTH COMPOUNDS/permittivity; VANADATES/electric conductivity; VANADATES/permittivity; PERMITTIVITY; CHEMICAL COMPOSITION; CHEMICAL PREPARATION; PHOSPHATES; VANADATES

36747 (INIS-SU–89, pp. 4-5) **Phase diagram of the system $RbPO_3$-V_2O_5.** Mardirosova, I.V. (Rostovskij-na-Donu Inzhenerno-Stroitel'nyj Inst., Rostov-na-Donu (USSR)); Kosobokova, N.S.; Bukhalova, G.A.; Savenkova, M.A. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

RUBIDIUM PHOSPHATES/phase diagrams; VANADIUM OXIDES/phase diagrams; CHEMICAL COMPOSITION; CHEMICAL REACTIONS; DENSITY; EUTECTICS; GLASS; MELTING POINTS; REFRACTIVITY

36748 (INIS-SU–89, pp. 5) **On the compounds of rubidium, cesium and lanthanum polyphosphates.** Bukhalova, G.A. (Rostovskij-na-Donu Inzhenerno-Stroitel'nyj Inst., Rostov-na-Donu (USSR)); Mardirosova, I.V.; Litvinova, G.N.; Matrosova, V.A. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

CESIUM PHOSPHATES/chemical preparation; LANTHANUM PHOSPHATES/chemical preparation; CHEMICAL COMPOSITION; GLASS; INFRARED SPECTRA; LATTICE PARAMETERS; MELTING POINTS; MOLECULAR STRUCTURE; RUBIDIUM PHOSPHATES

36749 (INIS-SU–89, pp. 6-7) **On the kinetics of dehydration of double orthophosphate hexahydrates $MgMPO_4$.** Lyutsko, V.A. (Belorusskij Gosudarstvennyj Univ., Minsk (Byelorussian SSR)); Frenkel', P.L. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

CESIUM PHOSPHATES/chemical reaction kinetics; CESIUM PHOSPHATES/dehydration; MAGNESIUM PHOSPHATES/chemical reaction kinetics; MAGNESIUM PHOSPHATES/dehydration; ACTIVATION ENERGY; DEHYDRATION; CRYSTALLIZATION; HYDRATES

36750 (INIS-SU–89, pp. 7) **Lithium, rubidium, and cesium cyclohexaphosphates.** Borodina, L.A. (AN SSSR, Moscow (USSR). Inst. Obshchej i Neorganicheskoj Khimii); Chudinova, N.N.; Kholodkovskaya, L.N. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

CESIUM PHOSPHATES/chemical preparation; CESIUM PHOSPHATES/dehydration; DEHYDRATION; CHEMICAL COMPOSITION; CRYSTAL STRUCTURE; CRYSTAL-PHASE TRANSFORMATIONS; HYDRATES; MONOCRYSTALS; SENSITIVITY; SPACE GROUPS; THERMAL DEGRADATION

36751 (INIS-SU–89, pp. 8) **Condensed phosphates of rare earth and rare alkali elements.** Masloboev, V.A. (AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya); Sazhenkov, A.Yu.; Krasilov, Yu.I. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

ALKALI METAL COMPOUNDS/crystallization; ALKALI METAL COMPOUNDS/glass; RARE EARTH COMPOUNDS/crystallization; RARE EARTH COMPOUNDS/glass; ABSORPTION SPECTRA; CRYSTALLIZATION; GLASS; CHEMICAL COMPOSITION; CHEMICAL PREPARATION; CRYSTAL FIELD; ELECTRONIC STRUCTURE; HIGH TEMPERATURE; LUMINESCENCE; PHOSPHATES

36752 (INIS-SU–89, pp. 9-10) **Infrared absorption spectra of rare alkali metal phosphates.** Malashonok, I.E. (Belorusskij Tekhnologicheskij Inst., Minsk (Byelorussian SSR)); Mel'nikova, R.Ya.; Dzyuba, E.D.; Pechkovskij, V.V. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

CESIUM PHOSPHATES/infrared spectra; ABSORPTION SPECTRA; CHEMICAL COMPOSITION

36753 (INIS-SU–89, pp. 10) **Determination of specific heats of double magnesium and alkali metal orthophosphates.** Frenkel', P.L. (Belorusskij Gosudarstvennyj Univ., Minsk (Byelorussian SSR)); Lyutsko, V.A. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

CESIUM PHOSPHATES/specific heat; MAGNESIUM PHOSPHATES/specific heat; CALORIMETRY; HIGH TEMPERATURE; MEDIUM TEMPERATURE; TEMPERATURE DEPENDENCE

36754 (INIS-SU–89, pp. 12) **Properties of mixed polyphosphates of silver and rare alkali metals.** Savenkova, M.A.; Sogomonova, R.A.; Zheltkova, N.N. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

NIOBATES/chemical reaction kinetics; NIOBATES/dissolution; ACTIVATION ENERGY; AMMONIUM FLUORIDES; HIGH TEMPERATURE; HYDROFLUORIC ACID; LITHIUM COMPOUNDS; MOLTEN SALTS; MONOCRYSTALS; NIOBATES; DISSOLUTION

36774 (INIS-SU–89, pp. 31-33) **Lithium dodecavanadates with mixed oxidation degree of vanadium.** Ivakin, A.A. (AN SSSR, Sverdlovsk (USSR). Inst. Khimii); Kruchinina, M.V.; Koryakova, O.V. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

VANADATES/phase studies; VANADATES/valence; CHEMICAL COMPOSITION; CHEMICAL PREPARATION; INFRARED SPECTRA; ION EXCHANGE; LAYERS; LITHIUM COMPOUNDS; MOLECULAR STRUCTURE; VANADATES; VALENCE

36775 (INIS-SU–89, pp. 33) **Vibrational spectra and structure of vanadates $M_2Zn(VO_3)_4$, where M-Rb, Cs.** Kristallov, L.V. (AN SSSR, Sverdlovsk (USSR). Inst. Khimii); Perelyaeva, L.A.; Slobodin, B.V. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

CESIUM COMPOUNDS/infrared spectra; CESIUM COMPOUNDS/molecular structure; VANADATES/infrared spectra; VANADATES/molecular structure; CHEMICAL COMPOSITION; POLYCRYSTALS; RAMAN SPECTRA; RUBIDIUM COMPOUNDS; VANADATES; VIBRATIONAL STATES; ZINC COMPOUNDS

36776 (INIS-SU–89, pp. 34-35) **Features of solid-phase interaction between lithium carbonate and niobium pentoxide hydrate.** Belov, V.V. (Moskovskij Inst. Radiotekhniki, Ehlektroniki i Avtomatiki, Moscow (USSR)); Shapiro, Z.I.; Velikodnyj, Yu.A.; Marugin, V.V.; Allakhverdov, G.R. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

NIOBIUM OXIDES/chemical reactions; CHEMICAL REACTION KINETICS; HIGH TEMPERATURE; HYDRATES; LITHIUM CARBONATES; MEDIUM TEMPERATURE; POWDERS

36777 (INIS-SU–89, pp. 35) **Phase composition in the system $LiVO_3$-TiO_2-V_2O_5(V_2O_4).** Golovkin, B.G. (AN SSSR, Sverdlovsk (USSR). Inst. Khimii); Volkov, V.L. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

VANADATES/phase diagrams; VANADIUM OXIDES/phase diagrams; AIR; CHEMICAL REACTIONS; HIGH TEMPERATURE; LITHIUM COMPOUNDS; PHASE STUDIES; SOLID SOLUTIONS; TITANIUM OXIDES; VANADATES

36778 (INIS-SU–89, pp. 36) **Effect of cesium ions on character of solubility and rare earth formate complexing processes.** Akhmatova, Zh.T. (AN SSSR, Moscow (USSR). Inst. Obshchej i Neorganicheskoj Khimii); Portnova, S.M. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

CESIUM COMPOUNDS/phase diagrams; CESIUM COMPOUNDS/solubility; EUROPIUM COMPLEXES/chemical preparation; EUROPIUM COMPOUNDS/phase diagrams; EUROPIUM COMPOUNDS/solubility; TERBIUM COMPLEXES/chemical preparation; TERBIUM COMPOUNDS/phase diagrams; TERBIUM

COMPOUNDS/solubility; AQUEOUS SOLUTIONS; SOLUBILITY; CRYSTALLIZATION; FORMATES; MEDIUM TEMPERATURE; QUANTITY RATIO

36779 (INIS-SU–89, pp. 36-37) **Interaction of lithium chlorides, nitrates, sulfates with rare earths and hexamethylenetramine in aqueous solutions at 25-100 deg C.** Shevchuk, V.G. (Poltavskij Inzhenerno-Stroitel'nyj Inst., Poltava (Ukrainian SSR)); Ivanitskaya, I.A.; Bunyakina, N.V.; Storozhenko, D.A.; Omelyan, V.I.; Shiraj, Yu.V. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

RARE EARTH COMPOUNDS/chemical reactions; RARE EARTH COMPOUNDS/solubility; AMINES; AQUEOUS SOLUTIONS; CRYSTALLIZATION; LITHIUM CHLORIDES; LITHIUM NITRATES; LITHIUM SULFATES; MEDIUM TEMPERATURE; PHASE DIAGRAMS; PHASE STUDIES; SOLUBILITY

36780 (INIS-SU–89, pp. 37) **Interaction of cesium, nickel and praseodymium (3) sulfates in aqueous solutions.** Shevchuk, V.G. (Poltavskij Inzhenerno-Stroitel'nyj Inst., Poltava (Ukrainian SSR)); Onishchenko, M.K.; Skorikov, V.M.; Vajsfel'd, M.I. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

CESIUM SULFATES/phase diagrams; CESIUM SULFATES/solubility; PRASEODYMIUM SULFATES/phase diagrams; PRASEODYMIUM SULFATES/solubility; AQUEOUS SOLUTIONS; SOLUBILITY; CHEMICAL COMPOSITION; CHEMICAL REACTIONS; CRYSTALLIZATION; MEDIUM TEMPERATURE; NICKEL SULFATES

36781 (INIS-SU–89, pp. 38) **Formation conditions and some properties of double nitrates of rare alkali metals and rare earths.** Shevchuk, V.G. (Poltavskij Inzhenerno-Stroitel'nyj Inst., Poltava (Ukrainian SSR)); Dryuchko, A.G.; Vigdorchik, A.G.; Omelyan, V.I.; Lazorenko, N.M.; Kisel', N.N. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

ALKALI METAL COMPOUNDS/chemical preparation; ALKALI METAL COMPOUNDS/phase diagrams; RARE EARTH COMPOUNDS/chemical preparation; RARE EARTH COMPOUNDS/phase diagrams; YTTRIUM NITRATES/chemical preparation; YTTRIUM NITRATES/phase diagrams; AQUEOUS SOLUTIONS; CHEMICAL COMPOSITION; CRYSTALLIZATION; MEDIUM TEMPERATURE; MOLECULAR STRUCTURE; MONOCRYSTALS; PHASE STUDIES

36782 (INIS-SU–89, pp. 38-39) **Synthesis and physicochemical study of double chlorides, nitrates, sulfates of rubidium and cesium with calcium, lanthanum, neodymium, ytterbium.** Storozhenko, D.A. (Poltavskij Inzhenerno-Stroitel'nyj Inst., Poltava (Ukrainian SSR)); Ivanitskaya, I.A.; Bunyakina, N.V.; Shiraj, Yu.V.; Omelyan, V.I. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

ALKALI METAL COMPOUNDS/crystallization; ALKALI METAL COMPOUNDS/phase diagrams; RARE EARTH COMPOUNDS/crystallization; RARE EARTH COMPOUNDS/phase diagrams; CRYSTALLIZATION; AQUEOUS SOLUTIONS; CALCIUM CHLORIDES; CHEMICAL COMPOSITION; CHEMICAL PREPARATION; GLYCOLS; HYDRATES; MEDIUM TEMPERATURE; MONOCRYSTALS; NITRATES; PHYSICAL PROPERTIES; SULFATES

36783 (INIS-SU–89, pp. 39-40) **Interaction of ammonium fluoroyttrates with lithium salts.** Mel'nichenko, E.I. (AN SSSR, Vladivostok (USSR). Inst. Khimii); Kalacheva, T.A.; Polishchuk, S.A. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

YTTRIUM FLUORIDES/chemical reactions; AMMONIUM FLUORIDES; CHEMICAL REACTION KINETICS; HIGH TEMPERATURE; LITHIUM CHLORIDES

36784 (INIS-SU–89, pp. 40-41) **Study of the system LiC_2H_5COO-$Y(C_2H_5COO)_3$-H_2O at 25 deg C.** Nadzharyan, K.A. (AN SSSR, Novosibirsk (USSR). Inst. Khimii Tverdogo Tela i Pererabotki Mineral'nogo Syr'ya). AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

YTTRIUM COMPOUNDS/phase diagrams; YTTRIUM COMPOUNDS/solubility; AQUEOUS SOLUTIONS; CARBOXYLIC ACID SALTS; CRYSTALLIZATION; LITHIUM COMPOUNDS; MEDIUM TEMPERATURE; PROPIONIC ACID; TRANSITION TEMPERATURE; SOLUBILITY

36785 (INIS-SU–89, pp. 52-53) **Low-melting alloys of halide and nitrate systems of alkali and alkaline earth metals and their practical use.** Il'yasov, I.I. (Zaochnyj Inst. Sovetskoj Torgovli, Rostov-na-Donu (USSR)). AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

ALKALI METAL COMPOUNDS/melting points; ALKALI METAL COMPOUNDS/phase diagrams; ALKALINE EARTH METAL COMPOUNDS/melting points; ALKALINE EARTH METAL COMPOUNDS/phase diagrams; CADMIUM NITRATES/melting points; CADMIUM NITRATES/phase diagrams; CHEMICAL REACTIONS; EUTECTICS; HALIDES; HIGH TEMPERATURE; LEAD COMPOUNDS; MOLTEN SALTS; SOLID SOLUTIONS; THALLIUM COMPOUNDS; USES

36786 (INIS-SU–89, pp. 45-46) **Synthesis and physicochemical properties of ammonium-containing fluoroaluminates of rare alkali elements.** Baldova, M.V.; Morozov, V.G.; Nikitina, S.D.; Shchegoleva, R.I.; Rys'kin, M.P.; Popova, R.A.; Mikhajlova, N.L. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

CESIUM COMPOUNDS/chemical preparation; ALUMINIUM COMPLEXES; AMMONIUM COMPOUNDS; CHEMICAL COMPOSITION; CHEMICAL PROPERTIES; COORDINATION NUMBER; FLUORIDES; PHYSICAL PROPERTIES

36787 (INIS-SU–89, pp. 48-49) **Thermographic and X-ray diffraction study of binary systems based on rare alkali metal and thallium (1) nitrates and conditions of solid solution formation in them.** Akopov, E.K. (Krasnodarskij Politekhnicheskij Inst., Krasnodar (USSR)); Panieva, L.A. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

CESIUM NITRATES/phase diagrams; CESIUM NITRATES/solid solutions; THALLIUM NITRATES/phase diagrams; THALLIUM NITRATES/solid solutions; CRYSTAL LATTICES; CRYSTAL-PHASE TRANSFORMATIONS; DENSITY; LATTICE PARAMETERS; PHASE STUDIES

36788 (INIS-SU–89, pp. 50) **Four-component system of lithium, cesium, potassium, calcium bromides.** Bukhalova, G.A. (Rostovskij-na-Donu Inzhenerno-Stroitel'nyj Inst., Rostov-na-Donu (USSR)); Litvinova, G.N.; Savenkov, I.S. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya.

1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

CESIUM BROMIDES/molten salts; CESIUM BROMIDES/phase diagrams; CALCIUM BROMIDES; ELECTROLYTES; EUTECTICS; LITHIUM BROMIDES; MELTING POINTS; POTASSIUM BROMIDES; QUANTITY RATIO

36789 (INIS-SU–89, pp. 49-50) **Synthesis and study of some properties of mixed hexacyanoferrates (3) of rare alkali and alkaline-earth elements.** Slivko, T.A. (Moskovskij Inst. Tonkoj Khimicheskoj Tekhnologii, Moscow (USSR)); Zimina, G.V.; Fomichev, V.V.; Kuligina, T.V. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

CESIUM COMPOUNDS/chemical preparation; CESIUM COMPOUNDS/pyrolysis; STRONTIUM COMPOUNDS/chemical preparation; STRONTIUM COMPOUNDS/pyrolysis; PYROLYSIS; CHEMICAL BONDS; CHEMICAL COMPOSITION; CRYSTAL STRUCTURE; DEHYDRATION; FERRICYANIDES; HYDRATES; SOLUBILITY

36790 (INIS-SU–89, pp. 53) **Lithium beryllates and their thermodynamic properties.** Kuranov, K.E. (AN SSSR, Moscow (USSR). Inst. Fizicheskoj Khimii); Atanov, A.I.; Saunin, E.I.; Gromov, V.V.; Zakharov, M.A. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

BERYLLIUM OXIDES/phase diagrams; BERYLLIUM OXIDES/vapor pressure; LITHIUM OXIDES/phase diagrams; LITHIUM OXIDES/vapor pressure; CHEMICAL COMPOSITION; EUTECTICS; EVAPORATION; MELTING POINTS; QUANTITY RATIO; VAPORIZATION HEAT

36791 (INIS-SU–89, pp. 54-55) **Study of interaction in ternary bromide systems of lithium, sodium, rubidium, cesium, cadmium, barium, calcium, and lead.** Il'yasov, I.I. (Zaochnyj Inst. Sovetskoj Torgovli, Rostov-na-Donu (USSR)); Dunaeva, T.I.; Barsegov, D.G.; Lepeshkov, I.N. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

ALKALI METAL COMPOUNDS/chemical reactions; ALKALI METAL COMPOUNDS/phase diagrams; ALKALINE EARTH METAL COMPOUNDS/chemical reactions; ALKALINE EARTH METAL COMPOUNDS/phase diagrams; CADMIUM BROMIDES/chemical reactions; CADMIUM BROMIDES/phase diagrams; CHEMICAL COMPOSITION; CRYSTALLIZATION; EUTECTICS; HIGH TEMPERATURE; SOLID SOLUTIONS

36792 (INIS-SU–89, pp. 55) **Complexing in ternary chloride systems of alkali metals and lead.** Il'yasov, I.I. (Zaochnyj Inst. Sovetskoj Torgovli, Rostov-na-Donu (USSR)); Dunaeva, T.I. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

CADMIUM CHLORIDES/chemical reactions; CADMIUM CHLORIDES/phase diagrams; CESIUM CHLORIDES/chemical reactions; CESIUM CHLORIDES/phase diagrams; LITHIUM CHLORIDES/chemical reactions; LITHIUM CHLORIDES/phase diagrams; CADMIUM COMPLEXES; CHEMICAL COMPOSITION; CRYSTALLIZATION; EUTECTICS; MELTING POINTS

36793 (INIS-SU–89, pp. 56) **Solubility of solid phases of the system $CsBr$-$HgBr_2$-H_2O at 50 and 75 deg C.** Azarova, L.A. (AN SSSR, Moscow (USSR). Inst. Obshchej i Neorganicheskoj Khimii); Kravchuk, K.G. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

CESIUM BROMIDES/phase diagrams; CESIUM BROMIDES/solubility; MERCURY BROMIDES/phase diagrams; MERCURY BROMIDES/solubility; AQUEOUS SOLUTIONS; SOLUBILITY; CRYSTALLIZATION; MEDIUM TEMPERATURE; TEMPERATURE DEPENDENCE

36794 (INIS-SU–89, pp. 57-58) **On the interaction of cesium nitrate with zinc nitrate in saturated aqueous solution at 298 K.** Tsirikhova, N.Kh. (Severo-Osetinskij Gosudarstvennyj Univ., Ordzhonikidze (USSR)); Khutsistova, F.M.; Kaloev, N.I. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

CESIUM NITRATES/phase diagrams; CESIUM NITRATES/solubility; AQUEOUS SOLUTIONS; SOLUBILITY; CRYSTALLIZATION; DENSITY; ELECTRIC CONDUCTIVITY; EQUILIBRIUM; MEDIUM TEMPERATURE; SATURATION; VISCOSITY; ZINC NITRATES

36795 (INIS-SU–89, pp. 58-59) **Regularities of structure and properties of mixed oxides of the composition $ABTeO_6$ (A-K, Rb, Cs, Tl; B-Nb, Ta, Sb).** Egorov, N.P. (Gor'kovskij Gosudarstvennyj Univ., Gorki (USSR)); Chernorukov, N.G.; Korshunov, I.A.; Sulejmanov, E.V. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

ALKALI METAL COMPOUNDS/crystal structure; ALKALI METAL COMPOUNDS/ion exchange; NIOBIUM OXIDES/crystal structure; NIOBIUM OXIDES/ion exchange; TANTALUM OXIDES/crystal structure; TANTALUM OXIDES/ion exchange; TELLURIUM OXIDES/crystal structure; TELLURIUM OXIDES/ion exchange; ANTIMONY OXIDES; CHEMICAL COMPOSITION; CHEMICAL PREPARATION; LATTICE PARAMETERS; PYROLYSIS; PYROLYSIS PRODUCTS; SOLID ELECTROLYTES; THALLIUM OXIDES

36796 (INIS-SU–89, pp. 59) **Physicochemical study of the systems BiI_3-M^1I (M^1-Li, Na, K, Rb, Cs) and properties of forming compounds.** Kaloev, N.I. (Gor'kovskij Gosudarstvennyj Univ., Gorki (USSR)); Bukhalova, G.A.; Dzeranova, K.B. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

ALKALI METAL COMPOUNDS/chemical reactions; ALKALI METAL COMPOUNDS/phase diagrams; BISMUTH IODIDES/chemical reactions; BISMUTH IODIDES/phase diagrams; BISMUTH COMPLEXES; CHEMICAL COMPOSITION; PHYSICAL PROPERTIES

36797 (INIS-SU–89, pp. 60) **Fusion phase diagram of the system BiI_3-KI.** Dzeranova, K.B. (Severo-Osetinskij Gosudarstvennyj Univ., Ordzhonikidze (USSR)); Bukhalova, G.A.; Kaloev, N.I.; Mardirosova, I.V. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

BISMUTH IODIDES/chemical reactions; BISMUTH IODIDES/phase diagrams; POTASSIUM IODIDES/chemical reactions; POTASSIUM IODIDES/phase diagrams; CHEMICAL COMPOSITION; EUTECTICS; MELTING POINTS; PHYSICAL PROPERTIES

36798 (INIS-SU–89, pp. 60-61) **Solubility diagrams of the systems Li_2SO_4-Na_2SO_4-$MeSO_4$-H_2O (Me-Mg, Mn, Co, Ni, Cu, Zn, Cd) at 25 deg C.** Nokhrin, V.I. (Leningradskij Gosudarstvennyj Univ., Leningrad (USSR)); Filippov, V.K. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

CADMIUM SULFATES/phase diagrams; CADMIUM SULFATES/solubility; AQUEOUS SOLUTIONS; SOLUBILITY; CRYSTALLIZATION; LITHIUM SULFATES; MEDIUM TEMPERATURE; SODIUM SULFATES; THERMODYNAMIC ACTIVITY

36799 (INIS-SU–89, pp. 62) **Sulfates of rare alkali metals.** Kovalev, A.E. (Poltavskij Inzhenerno-Stroitel'nyj Inst., Poltava (Ukrainian SSR)); Shevchuk, A.V.; Sakhno, T.V. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

ALKALI METAL COMPOUNDS/chemical preparation; ALKALI METAL COMPOUNDS/phase diagrams; AMMONIUM SULFATES; AQUEOUS SOLUTIONS; CHEMICAL COMPOSITION; CRYSTALLIZATION; HYDRATES; MAGNESIUM SULFATES; MEDIUM TEMPERATURE; SOLUBILITY

36800 (INIS-SU–89, pp. 62-63) **Solubility of sulfates and oxalates of alkaline earth metals in aqueous solutions of alkali metal salts.** Kopyrin, A.A. (Leningradskij Tekhnologicheskij Inst., Leningrad (USSR)); Pyartman, A.K.; Keskinov, V.A. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

ALKALI METAL COMPOUNDS/phase diagrams; ALKALINE EARTH METAL COMPOUNDS/phase diagrams; ALKALINE EARTH METAL COMPOUNDS/solubility; SOLUBILITY; AQUEOUS SOLUTIONS; MEDIUM TEMPERATURE; OXALATES; QUANTITY RATIO; SULFATES

36801 (INIS-SU–89, pp. 63) **Phase ratios in the system Li_2O-K_2O-NiO-V_2O_5.** Surat, L.L. (AN SSSR, Sverdlovsk (USSR). Inst. Khimii); Fotiev, A.A. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

VANADIUM OXIDES/chemical reactions; VANADIUM OXIDES/phase diagrams; CHEMICAL COMPOSITION; LITHIUM OXIDES; NICKEL OXIDES; PHASE STUDIES; POTASSIUM OXIDES

36802 (INIS-SU–89, pp. 64) **NMR study of interactions of rare alkali metal ions (Li^+ and Cs^+) with Co^{2+} and Ni^{2+} in aqueous solutions.** Mazitov, R.K. (AN SSSR, Moscow (USSR). Inst. Obshchej i Neorganicheskoj Khimii); Borina, A.F.; Gejst, A.G. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

CESIUM COMPOUNDS/chemical reactions; AQUEOUS SOLUTIONS; CESIUM 133; COBALT CHLORIDES; NICKEL CHLORIDES; NMR SPECTRA; QUANTITY RATIO

36803 (INIS-SU–89, pp. 115-116) **Conversion methods for complex fluorides of rare alkali elements.** Morozov, V.G. (AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya); Shchegoleva, R.I.; Nikitina, S.D.; Baldova, M.V.; Rys'kina, M.P. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

CESIUM FLUORIDES/chemical reactions; ALUMINIUM FLUORIDES; AQUEOUS SOLUTIONS; CHEMICAL COMPOSITION; QUANTITY RATIO; SILICON FLUORIDES

36804 (INIS-SU–89, pp. 117) **Technology of preparation of cesium chloride and iodine from CsI(Tl) monocrystal wastes.** Banik, V.V.; Cherginets, V.L.; Krivko, I.P.; Sherblyuk, E.N. AN SSSR, Apatity (USSR). Inst. Khimii i Tekhnologii Redkikh Ehlementov i Mineral'nogo Syr'ya. 1988. (In Russian). In *7. All-union conference on chemistry and technology of rare alkali elements. Summaries of reports.* Order Number DE89012153/JAW. Available from NTIS (US Sales Only), PC A10/MF A01; INIS.

36812 (INIS-SU–93, pp. 39-44) **Effect of carrier nature and Pt concentration on catalytic properties of deposited catalysts with respect to reaction of homomolecular isotopic exchange of hydrogen.** Korabel'nikova, L.M.; Vasilevich, A.A. Ministerstvo Vysshego i Srednego Spetsial'nogo Obrazovaniya SSSR, Moscow (USSR); Moskovskij Khimiko-Tekhnologicheskij Inst., Moscow (USSR). 1987. (In Russian). In *Isotopes in catalysis. Issue 147. Proceedings of the Moscow Chemical Technological Institute.* Order Number DE89012155/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

Effect of carrier (Al_2O_3 and SiO_2) nature and Pt concentration in deposited catalysts with respect to reaction of homomolecular isotopic exchange (HMIE) of hydrogen at -196 deg C and 66,6 Pa (0.5 mm of mercury) is studied. Dependence of specific catalytic activity of Pt/Al_2O_3 and Pt/SiO_2 on platinum concentration is shown. It is found that large platinum crystallites in Pt/SiO_2 system have higher activity than small ones. The carrier effect on catalytic and surface properties of deposited platinum is detected. The most noticeably the carrier effect is manifested in the ranges of small degrees of carrier surface filling with metal. Optimum platinum concentrations in Pt/Al_2O_3 and Pt/SiO_2 catalysts for hyrogen HMIE reaction are determined. 17 refs.; 3 figs.; 1 tab.

36813 (INIS-SU–93, pp. 44-59) **Low-temperature isotopic exchange in molecular hydrogen on films of transition and rare earth metals and their alloys with copper.** Zhavoronkova, K.N.; Peshkov, A.V.; Boeva, O.A. Ministerstvo Vysshego i Srednego Spetsial'nogo Obrazovaniya SSSR, Moscow (USSR); Moskovskij Khimiko-Tekhnologicheskij Inst., Moscow (USSR). 1987. (In Russian). In *Isotopes in catalysis. Issue 147. Proceedings of the Moscow Chemical Technological Institute.* Order Number DE89012155/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

Model reaction of homomolecular deuterium-hydrogen exchange is used to study catalytic properties of a wide class of transition and rare earth metals (REM), and REM-copper alloys to determine interelation between catalytic activity and metal electron structure. The character of specific catalytic activity (K_{sp}) dependence on position in Sc-Y-La...Hf series, that is different for 77-120 K (1) and 120-193 K (2) temperature ranges is determined. Comparison of K_{sp} with metal sublimation heats permitted to coclude that catalytic activity is caused both by probability of electron occupying the 5d-level and their delocalization degree, that in its turn is connected with the degree of electron occupying the 4f-level. It is shown that REM-copper fusion increases K_{sp} by 1-2 order, that is due to electron and cluster effects. 20 refs.; 9 figs.

36814 (INIS-SU–93, pp. 59-71) **Catalytic properties of hydride-forming intermetallic compounds in reactions with the participation of hydrogen.** Andreev, B.M.; Magomedbekov, Eh.P.; Pak, Yu.S.; Firer, A.A. Ministerstvo Vysshego i Srednego Spetsial'nogo Obrazovaniya SSSR, Moscow (USSR); Moskovskij Khimiko-Tekhnologicheskij Inst., Moscow (USSR). 1987. (In Russian). In *Isotopes in catalysis. Issue 147. Proceedings of the Moscow Chemical Technological Institute.* Order Number DE89012155/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

Results of studying activity of hydride-forming intermetallic compounds (IMC) of two classes, namely, $LaNi_5$ type and titanium-bearing IMC in reactions of interphase and homomolecular (T-H) isotopic hydrogen exchange, as well as (D-H) isotopic exchange between hydrogen and water vapors are presented. Activation energy and hydrogen pressure reaction order are determined. On the basis of obtained kinetic regularities it is shown that the limiting stage of interphase isotopic exchange is atomic hydrogen transfer from the surface to IMC crystal lattice volume. The limiting stage of isotopic exchange between hydrogen and water vapors is hemisorbed hydrogen interaction with absorbed water vapors, i.e. formation (disintegration) of activated complex on IMC surface.

36815 (INIS-SU–93, pp. 71-79) **Catalytic activity in reactions of isotopic exchange of carbon monoxide and adsorption properties of cataiysts on zinc oxide base.** Mikheeva, T.M. (Moskovskij Khimiko-Tekhnologicheskij Inst., Moscow (USSR)); Kasatkina, L.A.; Volynkina, A.Ya. Ministerstvo Vysshego i Srednego Spetsial'nogo Obrazovaniya SSSR, Moscow (USSR); Moskovskij Khimiko-Tekhnologicheskij Inst., Moscow (USSR). 1987. (In Russian). In *Isotopes in catalysis. Issue 147. Proceedings of the Moscow Chemical Technological Institute.* Order Number DE89012155/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

Activity of different zinc oxide samples in reaction of CO homomolecular isotopic exchnge (HMIE) ($^{13}C^{18}O+^{12}C^{16}O=^{13}C^{16}O+^{12}C^{18}O$), CO adsorption on ZnO and isotopic exchange between adsorbed and gaseous CO are investigated. The most active is ZnO sample prepared from $ZnCO_3$. Quantitative ratio between different with respect to surface strength molecules of adsorbed CO are experimentally determined. It is shown that by increase of ZnO time contact with CO the quantity of adsorbed CO($N_\sigma 0$/), capable of fast exchange with a gaseous phase, is reduced and the quantity of slowly exchanged adsorbed CO is increased. Correlation between decrease of $N_\sigma 0$/and decrease of CO HMIE with the catalyst holding time in CO medium is stated.

36816 (INIS-SU–93, pp. 79-84) **Homogeneous activation of molecular hydrogen: on the development of effective catalysts for isotopic exchange in protolytic media.** Sakharovskij, Yu.A. Ministerstvo Vysshego i Srednego Spetsial'nogo Obrazovaniya SSSR, Moscow (USSR); Moskovskij Khimiko-Tekhnologicheskij Inst., Moscow (USSR). 1987. (In Russian). In *Isotopes in catalysis. Issue 147. Proceedings of the Moscow Chemical Technological Institute.* Order Number DE89012155/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

Comparison of different catalytic systems for hydrogen isotopic exchange with protolytic solvent based on activation enthalpy and entropy values is carried out. Particular attention is paid to the effect of ligand environment of complex forming metallic central ion and solvent composition on free activation energy and stability of catalytic system. A conclusion is drawn on impossibility of absolutely stable and high-temperature catalyst in an isolated system.

36817 (INIS-SU–93, pp. 85-94) **Complexing and catalysis in reactions of chlorine isotopic exchange between aluminium chlorides and alkylchlorides in nonaqueous solvating solvents medium.** Zajtsev, S.A. (Moskovskij Khimiko-Tekhnologicheskij Inst., Moscow (USSR)); Kalinin, G.M.; Nikitina, O.M.; Rozhkovskij, A.A.; Shalygin, V.A.; Ivanov, L.P.; Gorbunov, A.I. Ministerstvo Vysshego i Srednego Spetsial'nogo Obrazovaniya SSSR, Moscow (USSR); Moskovskij Khimiko-Tekhnologicheskij Inst., Moscow (USSR). 1987. (In Russian). In *Isotopes in catalysis. Issue 147. Proceedings of the Moscow Chemical Technological Institute.* Order Number DE89012155/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

Results of systematic study of chlorine isotopic exchange between $AlCl_3$-^{36}Cl and chlorides of aliphatic series in dipolar aprotic solvent medium are presented. It is shown that ionic forms of aluminium chloride solvating complexes are predominant in exchange reaction catalysis.

36818 (INIS-SU–97, pp. 74-77) **Electron structure and electrostatic potential of some neutral organophosphorus extractants and their complexes.** Varnek, A.A. (Moskovskij Khimiko-Tekhnologicheskij Inst., Moscow (USSR)); Kuznetsov, A.N.; Petrukhin, O.M.; Sinegribova, O.A.; Korovin, V.Yu.; Randarevich, S.V. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Molecular electrostatic potential was used as a criterion of extraction ability of a series of neutral organophosphorus compounds: trimethylphosphate-trimethylphosphonate-trimethylphosphinate-trimethylphosphine oxide- and for analyzing mechanism of acid hydrolysis of alkylphosphates. Charge distribution in P=0 fragment was calculated by MNDO, CNDO/2 (sp), CNDO/2 (spa) methods. It was shown that negative charge on oxygen of phosphoryl group decreased from the first member of mentioned extractant series to the last one, while the extraction ability in this series increased. NMR data showed that changes in the electronic structure of tributhylphosphate (TBP) in complexes with Zr, Hf and Sc nitrates were similar to ones, observed in TBP complexes with HNO_3, but were more pronounced. Strond effect of cations of these metals on TBP electronic structure was considered to be the reason of their catalytic activity during acid hydrolysis of this extractant. 3 refs.; 4 figs.; 1 tab.

36819 (INIS-SU–97, pp. 176-179) **Role of the liquid-liquid partition coefficient of the extractable chelate in the extraction efficiency of metals with β-diketones.** Nobuo Suzuki (Tokyo Univ. (Japan)). AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Extraction of trivalent rare earths, Sc and Y from aqueous solutions by acetylacetone solutions in different organic solvents was studied. It is shown that coefficients of distribution of neutral chelates MAn of M^{3+} metal ions with acidic chelating agent HA are strongly affected by the nature of metal central ion and chelating ligands. In Sc(3) extraction by acetylacetone in heptane and octanol-1 the distribution coefficient grows with increase of acetylacetonate concentration and achieves the limiting value in the region of high concentrations of acetylacetonate. Extraction coefficient of Sc(3) chelate is much higher in all considered systems, as compared to Y(3) chelate. Coefficients of rare earth (3) extraction by acetylacetone grow linearly with increase of the value, inverse to their ionic radii. The difference of rare earth (3) extraction constants is explained by the difference both of formation constants and distribution constants of extracted chelates. 10 refs.; 3 figs.

36820 (INIS-SU–97, pp. 191-194) **Complexones in the processes of extraction of rare earth elements.** Korpusov, G.V. (AN SSSR, Moscow (USSR). Inst. Fizicheskoj Khimii); Krylov, Yu.S.; Danilov, N.A.; Evseeva, N.K. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Complexone application in extractive separation of rare earths is considered. Recommendations on the choice of extractive system with regard to the character of change of extractant and complexone selectivity in rare earth series are given. Main requrements for such systems were formulated. Fulfilment of these requirements provides for the maximal separation factors. Typical examples of effective separation and purification of rare earths in extractive systems with complexones are given complexones are given. 6 refs.; 12 figs.; 2 tabs.

36821 (INIS-SU–97, pp. 104-107) **Outer-sphere hydration of metal chelates and its role in liquid-liquid partition equilibria.** Narbutt, J. (Inst. of Nuclear Chemistry and Technology, Warsaw (Poland)). AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Role of hydration phenomenon in extraction separation of metals is discussed. Data on BeL_2, CrL_3, NpL_4, ZnL_2 (L- acetylacetone) solvent extraction were used to support earlier advanced hypothesis about formation of hydrogen bonds between molecules of dissolved chelate and water molecules from aqueous phase; donor oxygen atoms of coordinated ligands represent the centers of outer-sphere hydration. It is shown that the degree of outer-sphere hydration increases with growth of valency of metal-complexing agent atom and electronegative character of ligand donor atom. It is noted that salting out effect in metal chelate separation, caused by inert electrolytes, is also connected with hydration in aqueous phase. The conclusion is made about the important role of outer-sphere hydration in processes of liquid-liquid separation of metal complexes and about the necessity of taking it into account in further development of models of liquid extraction of metal ions. 12 refs.; 1 tab.

36822 (INIS-SU–97, pp. 111-115) **Micelle formation during extraction of alkali elements from strongly alkaline mediums.** Apanasenko, V.V. (Moskovskij Inst. Tonkoj Khimicheskoj Tekhnologii, Moscow (USSR)); Reznik, A.M.; Bukin, V.I.; Brodskaya, A.V. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Extraction of potassium, rubidium and cesium by phenol reagents in hydrocarbon solvents from strongly alkakine solutions was considered. Tendency of prepared alkali metal phenolates to form micelles in aqueous and organic phases was revealed. Phenolates tendency to form micelles is dictated mainly by the size and position of hydrocarbon substituent in molecule. It is shown that when micelles form in organic phase, alkali elements can be extracted both according to cation-exchange mechanism and according to micellar one. It is noted that alkai element extraction from strongly alkaline media requires the correct choice of extractant: alkali metal phenolate shouldn't form micelles in aqueous solution. n-Alkyl- and arylphenoldisulfides and polysulfides are most preferable for solvent extraction among considered phenol derivatives. 4 refs.; 3 figs.

36823 (INIS-SU–97, pp. 183-186) **Solvent extraction of scandium pigrate by crown ether and crystal structure of complex between picrate and benzo-15-crown-5.** Zhou, Z.X. (Sichuan Univ., Chengdu (China)); Du, C.Kh.; Zhou, Z.H.; Yu, K.B.; Zhou, Z.Y. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Mechanism of scandium picrate solvent extraction by benzo-15-crown-5(B15C5) solution in dichloroethane was studied and composition of extracted complex $Sc(OH)(pic)_2(B15C5)$ was established. The crystal, corresponding to extracted complex with respect to composition, was synthesized in acetonitrile and ethanol mixture. Data of element analysis and colorimetry showed that its composition corresponded to $Sc(pic)_3$center dot$(B15C5)_2$center dot$2H_2O$center dotCH_3CN. Crystals are triclinic, lattice parameters:

a=12.768, b=13.76, c=19.440 A; d81.03, β=70.88, γ=70.71 deg. Data of X-ray diffraction analysis show, that Sc^{3+} is bound with three picrate-aniones and two water molecules. Each picrate-anion is bound with Sc^{3+} by two donor oxygen atoms of phenol group and one of nitrogroups. Two molecules of B15C5 are associated with Sc^{3+} due to formation of hydrogen bond between coordinated water and ether oxygen atoms. 8 refs.; 3 figs.

36824 (INIS-SU–97, pp. 108-110) **State of water in extracts and its interaction with microwave field.** Chekmarev, A.M. (Moskovskij Khimiko-Tekhnologicheskij Inst., Moscow (USSR)); Kharlamov, V.V.; Chibrikina, E.I.; Kharlamova, I.M. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

A study was made on the reasons of different behaviour of extractive systems, based on primary and ternary amines. It is shown that the whole complex of experimental data on zirconium sulfate extraction by these amines can be explained, if it is assumed that reverse micelles with different water content in cavities form in extract phase. The assumption was confirmed by results of measuring dielectric permittivity and viscosity of extracts, as well as their heating rates under the effect of microwave radiation. 3 refs.; 1 fig.

36825 (INIS-SU–97, pp. 120-122) **Hydration and solvation energies and thermodynamic distribution coefficient of some extraction systems.** Kulawik, I. (Institute of Nuclear Physics, Cracow (Poland)); Kulawik, J.; Mikulski, J. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Hydration and solvation energies, thermodynamic and analytic coefficients of distribution were determined for some extractive systems with tributylphosphate (TBP) and acetylacetone (AA), including TBP-UO_2Cl_2-HCl, TBP-$ThCl_4$-HCl, AA-$InCl_3$-HCl system. It is shown, that the more is the difference of solvation and hydration energies in extractive system, the more is separation coefficient. 4 refs.; 1 fig.; 1 tab.

36826 (INIS-SU–97, pp. 203-205) **Studies of the influence of different anions on extraction of neodymium with di(1-methylheptyl)methyl phosphonate.** Chun-Hui Huang (Beijing Normal Univ., BJ (China). Inst. of Low Energy Nuclear Physics); Rong-Fang Xi; Hai Guo; Guang-Xian Xu. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

A study was made on extraction of $Nd(NCS)_3$, $Nd(ClO_4)_3$, $Nd(NO_3)_3$ by di-(1-methylhexyl)methyl phosphonate (P-350) in hexane. ΔG^0(kJ/mol), ΔH^0(kJ/mol) and ΔS^0(kJ/mol) were calculated. They are equal to: -9.719, -29.92, -67.78 for P-350(hexane)-$Nd(NCS)_3$ system; 3.752, -74.31, -261.9 for P-350(hexane)-$Nd(ClO_4)_3$ system; 2.265, -22.69, -83.68 for P-350(hexane)-$Nd(NO_3)_3$ system. Structure of extracted complexes in hexane solution and corresponding solid complexes were correlated with triphenylphosphine oxide as P-350 model. Data of IR-spectroscopy show, that absorption bands of complexes in saturated organic solvents or in the solid phase are shifted to the region of lower frequencies as compared to absorption bands of corresponding salts. This testifies to similarity of complex structures in both phases. 6 refs.; 2 tabs.

36827 (INIS-SU–97, pp. 213-216) **Complex formation of lanthanide(111) with acetylacetone studied by the akufve-lison technique.** Albinsson, Y. (Chalmers Univ. of Tech., Goeteborg (Sweden). Dept. of Nuclear Chemistry); Rudberg, J. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Complexing of trivalent lanthanides (Ln=Nd, Pm, Sm, Eu, Tb, Ho, Tm, Lu) with acetylacetone (HAA) in two-phase extractive system (0.1-4M)HAA in benzene-aqueous solution of 1M Na(H)ClO_4 at pH 3-9 was studied by the AKUFVE-LiSOL technique. Experiments were conducted in inert atmosphere at 25 deg C and Ln concentration 10^{-6}-10^{-4} M. The data obtained enabled to evaluate the contributions of different complex forms to the total complexation during solvent extraction. Equilibrium constants of these forms were calculated, the dependence of $Ln(AA)_3$ distribution constants and adduct formation constants on Ln atomic number was determined. It was shown that low distribution coefficients of neutral complexes (D=0.05-1.3) were related with hydration of extracted particles by 2-3 water molecules. 8 refs.; 1 fig.; 1 tab.

36828 (INIS-SU–97, pp. 217-219) **Mechanism of extraction 4th period of periodic system metal ions with carboxylic acids in sulphate systems.** Kopacz, S. (Ignacy Lukasiewicz Technical Univ. Rzeszow (Poland)). AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Extraction of transition metal ions of the 4th period of Periodic system by carboxylic acids in sulfate systems was studied. It is shown that depending on composition and physicochemical properties of aqueous phase (pH, the type of metal ion, its complexing properties etc.) the solvent extraction may proceed according to two mechanisms: cation-exchange or hydration-solvation. The extraction is more effective in the field of cation-exchange mechanism. 6 refs.; 1 fig.; 1 tab.

36829 (INIS-SU–97, pp. 237-240) **Low-coverned nature of association (micellation) of dialkylphosphates in water and organic phases and their manifestation in the process of metal extraction with dialkylphosphoric acid.** Golovanov, V.I. (Chelyabinskij Univ. (USSR)). AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

A study was made on micellation of di-n-butyl- and di-(2-ethyhexyl)phosphates with Co^{2+}, Ni^{2+}, Cu^{2+}, Cd^{2+}, Zn^{2+} cations in water and extracts, as well as on dependences of their distribution in water and organic solvents (n-heptane, toluene, tetrachloromethane) at the ratio of water and organic phase volumes equal to 1:1 and at 25 deg C. Three types of distribution isotherms, corresponding to oleophilic, hydrophilic and amphiphilic micellation surfactants (MSAS) were revealed in experiments. Distribution isotherms of oleophilic and hydrophilic MSAS are explained easily by the pseudophase micellation model. The results obtained show that quantitative description of metal extraction by dialkylphosphoric acids is limited by their micellar association in organic and water phases. 6 refs.; 3 figs.; 3 tabs.

36830 (INIS-SU–97, pp. 244-247) **Physico-chemical study of extraction systems by the method of solubility diagrams.** Tanasheva, M.R. (Kazakhskij Gosudarstvennyj Univ., Alma-Ata (USSR)). AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Method for mathematical description of liquid-loquid and liquid-liquid-solid equilibria was developed. The method was used to evaluate phase state of systems, containing inorganic acids (HCl, HNO_3, H_2SO_4, H_3PO_4, H_3BO_3), alkali and alkaline earth metal salts, water and neutral extractions (ketones, alcohols, N,N-dialkylamides). Composition of extracted complexes could be determined from the phase diagrams. The data obtained enabled to conclude that suggested approach was more informative than other methods, because it permitted to estimate the whole statics of the

extraction process and determine the composition of coexisting phases without their isolation and separate investigation. 3 refs.; 3 figs.

36831 (INIS-SU–97, pp. 260-263) **Size-selective extraction of metal salts: the general principles.** Yakshin, V.V. (AN SSSR, Moscow (USSR). Inst. Geokhimii i Analiticheskoj Khimii). AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Consideration is given to application of the structural correspondence principle for explaining processes of selective (with respect to ion size) solvent extraction of metal salts from aqueous solutions to organic phase by crown-ethers of different spatial and electronic structure. A study has been made on more than 50 different structures of cyclic and acyclic polyethers, containing aromatic, aliphatic and cycloaliphatic fragments. It is shown that introduction of additional substituents enables to increase extraction selectivity and separate elements with similar chemical properties. 6 refs.; 3 tabs.

36832 (INIS-SU–97, pp. 268-270) **New bis(grown ether)s as extraction agents.** Aurich, J. (Akademie der Wissenschaften der DDR, Dresden (German Democratic Republic). Zentralinstitut fuer Festkoerperphysik und Werkstofforschung); Holdt, H.-J.; Gloe, K.; Muhl, P.; Kuntosch, G. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Extraction properties of crown-ethers of different compositions with respect to Na^+, K^+, Rb^+, Cs^+, Sr^{2+}, Ag^+ ions were studied. Extraction constants of these ions were determined. It was shown that cesium-selective extractant was presented by one of investigated bis-crown-ethers of B18C6 type. Possibility of determining composition of formed complexes of K^+, Rb^+, Cs^+, Ag^+ ions with bis-crown-ethers by the method of conductometric titration was noted. 7 refs.; 2 figs.

36833 (INIS-SU–97, pp. 271-273) **Synergic extraction of metals with 4-acylpyrazol-5-ones and grown ethers.** Sastre, A. (Bilbao Univ. (Spain). Escuela Tecnica Superior de Ingenieros Industriales); Sahmoune, A.; Brunette, J.P.; Leroy, M.J.F. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

A study was made on extraction of bivalent transition metals (Cu, Co, Zn, Cd) by mixtures of 1-phenyl-3-methyl-4-benzoylpyrozol-5-one (HPMBP) and crown-ethers with different cavities size from aqueous media, containing LiCl, NaCl, KCl, CsCl, $NaNO_3$ or $Ba(NO_3)_2$. Effect of symergetic extraction was revealed. Analysis of distribution data showed, that composition of extracted samples in organic phase depended on the type of electrolyte cation. 5 refs.; 2 tabs.

36834 (INIS-SU–97, pp. 276-279) **Ionizable polyethers as specific metal ion carriers in liquid-liquid extraction and liquid membrane separations.** Walkowiak, W. (Warsaw Univ. (Poland)); Charewicz, W.A.; Bartsch, R.A.; Ndip, G.M. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Consideration is given to results of investigations into competitive extraction and penetration through a liquid membrane of alkali and alkaline earth cations from aqueous solutions by a series of lipophilic and ionizable acyclic polyethers of various molecular structure. It is shown that specificity and selectiviy of cation carriers in liquid-liquid extraction and liquid membrane separation depend on molecular structure of acyclic polyethers. 12 refs.

36835 (INIS-SU–97, pp. 280-283) **Studies on extraction of metals with 3-phenyl-4-acyl-5-isoxazolones- new series of chelating extraction.** Jyothi, A. (Indian Inst. of Tech., New Delhi (India). Dept. of Chemistry); Rao, G.N. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

A study was made on extraction of some bivalent transition metals and Cd(2) by 3-phenyl-4-acetyl-5-isoxazolone (HPAD) in methylisobutyl ketone and by 3-phenyl-4-benzoyl-5-isoxazolone (HPBI) in chloroform. It is shown that HPAI extracts only 25% of Cd(2) at pH 8.8 and HPBI-90% in pH 8.0-9.0 range. The extraction mechanism includes addition of two liqand molecules to metal ion with release of two protons. 13 refs.; 5 figs.; 1 tab.

36836 (INIS-SU–97, pp. 297-300) **Extractants for boron.** Alekperov, E.R. (AN Azerbajdzhanskoj SSR, Baku (USSR). Inst. Neorganicheskoj i Fizicheskoj Khimii); Reznik, A.M. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Boron extraction by 2-hydroxy-5-octylbenzylethanolamine (OBEA) in organic solvents (benzene, hexane, heptanol, CCl_4, methylethylketone) was studied. The dependence of boron extraction by OBEA on pH passes through the maximum for all studied solvents. The maximall distribution coefficients are observed in the region of pH 5.0-7.5. Molar ratio boron: OBEA in the formed complex equals 1:1; it is constant and is independent of hydrogen ion concentration in the system. Complex composition corresponds to formula $C_{17}H_{28}O_3NB$, m.p.=148-149 deg C. Coordination bond of boron with nitrogen in the molecule is responsible for formation of chelate center, which includes penta- and hexamembered cycles stabilizing the complex.

36837 (INIS-SU–97, pp. 209-212) **Mechanism of nitric acid and strontium extraction with zirconium di-2-ethylhexyl phosphate complexes-studying by the ^{14}N and ^{31}P NMR methods.** Vashman, A.A. (Vsesoyuznyj Nauchno-Issledovatel'skij Inst. Neorganicheskikh Materialov, Moscow (USSR)); Nikiforov, A.S.; Pronin, I.S.; Smelov, V.S.; Shesterikov, V.N. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

^{14}N and ^{31}P NMR methods were used to study strontium and nitric acid solvent extraction by zirconium complexes with di-2-ethylhexyl phosphoric acid (HA) in $ZrA_4(HA)_2$-$C_{10}H_{22}$-H_2O-HNO_3-Sr system, depending on concentration of its components. It is proposed that strontium extraction into organic phase proceeds by means of $ZrA_4(HA)_2$ complex, in which one Sr^{2+} ion is substituted for two protons in HA molecules, solvating ZrA_4 complex, with formation of ZrA_4center dotSrA_2 complex. 1 ref.; 4 figs.

36838 (INIS-SU–97, pp. 301-304) **Some possibilities for improvement of the extraction properties in mixed extraction systems.** Hadjiev, D. (Bylgarska Akademiya na Naukite, Sofia (Bulgaria)); Galabova, G. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Possibilities of improving extractive properties of acid extractants are considered. A new type of extraction system, composed of cation and anion extractants (fatty acids, D2EHPA, amines) in kerosene, containing 2 vol.% tributylphosphate as an emulsion inhibitors, is described. Study of cadmium and other metal extraction by mixed extractants shows that amine addition enables to correct pH value in the extraction system and achieve higher distribution coefficients of metal. The results obtained demonstrate high potentialities of mixed extraction systems of this type. These systems use

conventional acidic and basic components, therefore they form a basis for further development of selective extraction systems by a simple modification of the structure of individual components of the extractant. 9 refs.; 2 figs.; 2 tabs.

36839 (INIS-SU–97, pp. 305-309) **Petroleum sulfides, sulfoxides, and sulfones used as extragents.** Nikitin, Yu.E. (AN SSSR, Ufa (USSR). Inst. Khimii); Lyapina, N.K.; Murinov, Yu.I. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Possibilities of using petroleum sulfides, sulfoxides and sulfones for extraction and separation of wide range of elements are considered. It is shown that petroleum sulfides appear to be effective and selective extractants in extraction and separation of noble metals (Ru, Au, Pt, etc.). Petroleum sulfoxides are promising for solvent extraction of transition metals, actinides, rare earths etc. 4 refs.; 2 figs.

36840 (INIS-SU–97, pp. 318-320) **Extraction of zinc(2), cadmium(2), copper(2) and iron(3) by cyanex 272.** Figuerola, E. (Bilbao Univ. (Spain). Escuela Tecnica Superior de Ingenieros Industriales); Miralles, N.; Sastre, A.; Aguilar, M. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

A study was made on extraction of zinc(2), cadmium(2), copper(2) and iron(3) from aqueous solutions by CYANEX 272 extractant dissolved in Isopar-H at 25 deg C. Equilibrium constants of extraction, as well as the dependences of distribution coefficients on pH and extractant concentration at steady metal concentration (10^{-4} mol.dm^{-3}) were determined. 8 refs.; 1 tab.

36841 (INIS-SU–97, pp. 321-325) **Trials on the molecule design of organic extractants.** Chengye Yuan (Academia Sinica, Shanghai, SH (China). Shanghai Inst. of Organic Chemistry); Shusen Li. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Contribution of structural parameters into extractive behaviour of ligands is considered. It is shown that reactivity of the central atom or group of atoms, the steric effect and ligand solubility are the basic structural factors determining the extraction behaviour. Data on rare earth (Nd, Sm, Y, Yb) extraction enable to conclude that there are quantitative relationships between the separation factor and the steric parameters. These relationships permit on the one hand to estimate the separation factor of rare earth pairs when using any extractant and on the other hand to choose the most effective one for separation of this pair. The methods of measuring for steric effect of substituent are suggested. 13 refs.; 2 tabs.

36842 (INIS-SU–97, pp. 326-329) **Regularities of the extraction of rare earth elements with triisoamyl phosphate.** Danilov, N.A. (AN SSSR, Moscow (USSR). Inst. Fizicheskoj Khimii); Korpusov, G.V.; Utkina, O.V.; Pogorel'skaya, S.A. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

A study was made on practically important regularities of rare earth element (REE) extraction by triisoamyl phosphate (TiAP): isotherms of REE extraction, effect of REE and salting-out agents concentrations in aqueous phase on REE distribution and separation coefficients, effect of HNO_3 concentration and others. The data obtained show, that TiAP is the typical representative of neutral organophosphoric compounds, and its extraction properties are close to those of TBP. The third phase doesn't form during REE nitrate extraction by TiAP solutions in saturated hydrocarbons of any concentration. High selectivity is not observed during separation of cerium subgroup REE by TiAP. TiAP losses are lower than those of TBP due to lower TiAP solubility in water. 2 refs.; 7 figs; 3 tabs.

36843 (INIS-SU–97, pp. 330-335) **Some regularities of extraction of rare earth elements by organophosphoric acid.** Korpusov, G.V. (AN SSSR, Moscow (USSR). Inst. Fizicheskoj Khimii); Keimirov, M.A.; Danilov, N.A.; Djumauradov, B. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Consideration is given to results of investigation of extraction of rare earth macroquantities from nitrate solutions by D-2-isopropyl-5-methylhexylphosphoric and 2-isopropyl-5-methylhexylphosphoric acids. It is shown that extractant selectivity decreases with increase of aqueous phase acidity. The selectivity is usually higher against the background of macroquantities of weakly extracted component, but some times another dependence is observed. It is noted that substitution of the diluent for more polar one which monomerizes extractants, leads to the loss of selectivity. But in small guantities polar diluents provide the stability of the extraction system for formation of sediments. Both sampls of organophosphoric acids provide for extraction process at low HNO_3 concentrations without rick of sediment formati on of extracted compounds in organic phase. 1 ref.; 15 figs.; 4 tabs.

36844 (LA-UR–89-1883) **Atomic oxygen-MoS_2 chemical interactions.** Cross, J.B.; Martin, J.A.; Pope, L.E.; Koontz, S.L. Los Alamos National Lab., NM (USA). 1989. 13p. Sponsored by DOD;DOE/MA;NASA. DOE Contract W-7405-ENG-36;AC04-76DP00789. (CONF-890468–12: 16. international conference on metallurgical coatings and equipment exhibit, San Diego, California, USA, 17-21 Apr 1989). Order Number DE89014241/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The present study shows that, at 1.5 eV O-atom translation energy, SO_2 is generated and outgases from an anhydrous MoS_2surface with an initial reactivity nearly 50% that of kapton. The reaction of atomic oxygen with MoS_2 has little or no translational energy barier; i.e., thermally generated atomic oxygen reacts as readily as that having 1.5 eV of translational energy. It is also shown that water, present in the flowing afterglow apparatus used to study thermal O-atom reactivity, formed sulfates on the MoS_2 surface and that the sulfate is not likely in the form of sulfuric acid. These results imply that water dumps or outgasing in low earth orbit have the potential of forming sulfuric acid covered surfaces on MoS_2 lubricants. For MoS_2 films sputter-deposited at 50-70°C, friction measurements show a high initial friction coefficient for O-atom exposed MoS_2 surfaces (up to 0.25) which drops to the normal low values after several cycles of operation in air and ultrahigh vacuum. For MoS_2 films deposited at 200°C, the friction coefficient was not affected by the O-atom exposure. 11 refs., 3 figs.

36845 (LBL–25559) **Tritium labeling by thermally generated tritons.** Morimoto, H.; Williams, P.G.; Saljoughian, M. Lawrence Berkeley Lab., CA (USA). Jun 1988. 6p. Sponsored by DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-880787–8: 3. international symposium on the synthesis and applications of isotopically labeled compounds, Innsbruck, Austria, 17-21 Jul 1988). Order Number DE89014904/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The predominant effect of thermal atom irradiation on solid molecules is saturation of their aromatic functions. Only low level of tritium exchange is observed for aliphatic solids. In contrast, liquids whose frozen surface can be rendered somewhat mobile at appropriate temperatures exhibit more exchange than addition. The rank order of effectiveness of several metals in promoting exchange/addition appears similar to the rank order for heterogeneous catalytic hydrogenation. 3 refs., 8 figs.

36846 (PNL-SA–16621) **Electrospray ionization-mass spectrometry and tandem mass spectrometry.** Loo, J.A.; Barinaga, C.J.; Edmonds, C.G.; Udseth, H.R.; Smith, R.D. Pacific Northwest Lab., Richland, WA (USA). May 1989. 3p. Sponsored by DOE Energy Research. DOE Contract AC06-76RL01830. (CONF-8905166–1: American Society for Mass Spectroscopy annual

symposium, Miami Beach, Florida, USA, 22-26 May 1989). Order Number DE89014465/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The ability to produce multiply charged molecular ions for biomolecules allows mass spectrometers to analyze compounds with molecular weights much in excess of the instrument's mass limit, but within the mass-to-charge range of most conventional mass spectrometers. In fact, proteins with molecular weights in excess of 130,000 daltons have been successfully analyzed by ESI-MS with a quadrupole mass spectrometer of limited m/z range (1700) in our laboratory. We have compared the ESI mass spectra of large proteins with and without reduction of its disulfide bridges. By cleavage of cysteine-cysteine bonds and thereby affecting the tertiary structure of the protein, a dramatic increase in the number of positive charges is observed. Highly charged ions desorbed from the droplets are sampled through a nozzle-skimmer orifice to be detected by the quadrupole mass spectrometer. Increasing collision energies also yields significant fragmentation of large peptide and proteins. 3 refs.

36847 (UCID–21710) **The equation of state of perfluorododecane to 48 GPa.** Simpson, R.L.; Helm, F.H.; Cook, T.M. Lawrence Livermore National Lab., CA (USA). 24 May 1989. 12p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE89014306/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Shock Hugoniot states of perfluorododecane were determined between 0.7GPa and 23GPa. The material has significant curvature in the U_s-u_p plane below 5GPa. Off Hugoniot states were determined up to 48GPa using a reflected shock technique. Deviations in the P-V and U_s-u_p relationships between 22GPa and 30GPa indicate the possibility of material decomposition at these shock pressures. Further work is required to verify that this is not just an experimental artifact. The effect of gelling with 3 wt % of SiO_2 resulted in no discernible difference in the Hugoniot behavior. 2 refs., 10 figs., 5 tabs.

36848 (UCRL–21083) **High-temperature optical-fiber pH sensor: Final report.** Angel, S.M.; Poco, J.F. Lawrence Livermore National Lab., CA (USA). Jun 1989. 31p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE89014103/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In this report, the results of research on high-temperature optical-fiber pH sensors will be presented. We have shown that these sensors (optrodes) can be made to work in very-high-temperature (300°C) water for long periods and that it is possible to measure pH using fluorescent inorganic ions doped into solid matrices. A high-temperature pH optrode can be made using these techniques; however, more research is needed into the chemistry of the carrier matrices and fluorescent dopants. New types of materials should be studied, including solid polymer ionic conductors and high-temperature epoxies. Particular emphasis should be placed on developing an Eh optrode because it also will be very useful and probably more easily developed. Transition-metal ions and complexes, as well as certain stable organic dyes, (materials that are very stable at high temperature) should also be investigated as dopants. 5 refs., 22 figs.

36849 (UCRL–53922) **Kinetics of the gas phase tritium oxidation reaction.** Failor, R.A. Lawrence Livermore National Lab., CA (USA). 27 Mar 1989. 289p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE89014605/JAW. Available from NTIS, PC A13/MF A01 - OSTI; GPO Dep.

Thesis. Submitted to Univ. of California, Berkeley.

Homogeneous gas-phase kinetics of tritium oxidation ($2T_2 + O_2 \rightarrow 2T_2O$) have been studied with a model that accounts explicitly for radiolysis of the major species and the kinetics of the subsequent reactions of ionic, excited-state, and neutral species. This dissertation includes a detailed calculation of the radiolysis product distribution due to the tritium beta decay, with special attention to oxygen radiolysis. Adjustments were made to hydrogen-based rate constants, obtained from the literature, to account for kinetic isotope effects. The effects of self-radiolysis of pure T_2 on the tritium oxidation reaction were calculated. Tritium atoms, the primary product of T_2 self-radiolysis, altered the oxidation mechanism only during the first few seconds following the initiation of the $T_2 - O_2$ reaction. Ozone, an important intermediate in T_2 oxidation, was monitored in-situ by uv absorption spectroscopy for 0.01 – 1.0 mol% in 1 atm O_2. The shape of the experimental ozone time profile agreed with the model predictions. As predicted, the measured initial rate of ozone production varied linearly with initial T_2 concentration ($[T_2]_0$), but at an initial rate one-third the predicted value. 167 refs., 37 figs., 18 tabs.

36850 Background correction in photothermal deflection spectroscopy using a single position sensor. Spear, J.D. (Lawrence Berkeley Lab., Mail Stop 90-2024, Berkeley, CA (US)); Russo, R.E.; Silva, R.J. v.v of 1988 Pittsburgh conference and exposition on analytical chemistry and applied spectroscopy (abstracts). Pittsburgh Conference, Pittsburgh, PA (1988). (CONF-880204–: 39. Pittsburgh conference and exposition on analytical chemistry and applied spectroscopy, New Orleans, LA, USA, 22-26 Feb 1988).

Technical Paper NO. 537.

Photothermal spectroscopic techniques, such as photoacoustic, thermal lensing, and photothermal deflection have been well recognized for their ability to measure ultra-sensitive optical absorption in transparent and opaque media. However, the sensitivity of these techniques is often limited by background absorption. In this paper, the authors describe a differential dual-beam photothermal deflection spectrometer using only a single position sensor to correct for background absorption.

36851 A new potentiometric method for the estimation of the rare earth elements. Selig, W.S. (Lawrence Livermore National Lab., Livermore, CA (US)). v.v of 1988 Pittsburgh conference and exposition on analytical chemistry and applied spectroscopy (abstracts). Pittsburgh Conference, Pittsburgh, PA (1988). (CONF-880204–: 39. Pittsburgh conference and exposition on analytical chemistry and applied spectroscopy, New Orleans, LA, USA, 22-26 Feb 1988).

Technical Paper NO. 694.

Chinese workers recently described a new potentiometric method for lead using sodium tetraphenylborate (NaTPB) as a titrant. Based on a previous Chinese publication, the authors have recently developed a method for the estimation of the alkaline earth metals by sequential titration with NaTPB. In the present work, the authors report a similar method for the estimation of the rare earth elements, including Sc and Y. The sensing electrode is a spectrographic graphite rod, coated with a solution of poly(vinyl chloride) and dioctylphthalate in tetrahydrofuran as previously described. The reference electrode was a double-junction Ag/AgCl electrode. The titration system is controlled by a Tektronix 4051 graphics computer system. Single cations or mixtures up to 0.5 mequiv are determined by potentiometric titration with 0.05 N NaTPB, after formation of the oxonium cations by reaction with an aqueous solution of poly(ethylene glycol) (PEG). Best results are obtained with PEGs of molecular weights from 8,000 to 20,000. Sequential estimation of Pb + Ba, Sr, and Ca, and the sum of the rare earth elements is also reported, plus possible applications to Al, Ga, and anions precipitated by lead.

36852 Study of the separation of two overlapping compounds in preparative liquid chromatography. Ghodbane, S. (Oak Ridge National Labs., Analytical Chemistry Div., Oak Ridge, TN (US)); Guiochon, G. v.v of 1988 Pittsburgh conference and exposition on analytical chemistry and applied spectroscopy (abstracts). Pittsburgh Conference, Pittsburgh, PA (1988). (CONF-880204–: 39. Pittsburgh conference and exposition on analytical chemistry and applied spectroscopy, New Orleans, LA, USA, 22-26 Feb 1988).

Technical Paper NO. 1154.

In preparative chromatography, columns are overloaded and operated under conditions where equilibrium isotherms are no longer linear. Accordingly, the retention times of the peak maximum vary with increasing sample size, the peaks broaden and become more and more unsymmetrical. Thus, it is virtually impossible to make any accurate prediction of the peak profiles from simple chromatographic theory. The theoretical prediction can be made by writing the mass balance equation for each component of the sample in a given slice of the column and integrating the system of partial differential equations obtained. The boundary conditions are defined by the injection characteristics (i.e., the profile of the input band), and the multi-component, competitive isotherm must be known. The results obtained so far are very encouraging. The model is very

powerful and is used to study the influence of various experimental parameters involved in the prediction of band profiles.

36853 Protolytic properties of perxenic acid. Klaening, U.K. (Aarhus Univ. (Denmark)); Appelman, E.H. *Inorganic Chemistry (USA)*, 27(21): 3760-3762 (19 Oct 1988).

Spectra and protolytic properties of aqueous perxnic acid in the pH range -0.2 to 13 were studied by conventional and stopped-flow spectrophotometry. The following pK values and limits were found (25.0°C): $pK_{H4}XeO_6 < 0$, $pK_{H3}XeO_6^- = 4.29$ {plus minu} 0.03; $pK_{H2}XeO_6^{2-} = 10.81$ {plus minu} 0.04. The enthalpy of dissociation 25.0°C of $H_3XeO_6^-$ is 0 {plus minu} 5 kJ mol^{-1}; that of $H_2XeO_6^{2-}$ is 3 {plus minu} 2 kJ mol^{-1}. 12 references, 4 figures, 1 table.

Lawrence Berkeley Lab., CA (USA). Apr 1989. 6p. Sponsored by DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-8905161–1: International conference on surface and thin film studies using glancing-incidence x-ray and neutron scattering, Marseille, France, 31 May - 2 jun 1989). Order Number DE89013424/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Grazing-incidence x-ray scattering studies of the evolution of electrochemically deposited layers of lead on silver (111) as a function of applied electrochemical potential are presented. Measurements were made with the adsorbed layers in contact with solution in a specially designed sample cell. The observed lead structures are a function of the applied potential and range from an incommensurate monolayer, resulting from underpotential deposition, to randomly oriented polycrystalline bulk lead, resulting from lower deposition potentials. These early experiments demonstrate the ability of in situ x-ray diffraction measurements to determine structures associated with electrochemical deposition. 6 refs., 4 figs.

36855 (JAERI-M–88-272) **Annual report of the Osaka Laboratory for Radiation Chemistry, Japan Atomic Energy Research Institute, (no. 20). April 1, 1986 - March 31, 1987.** Japan Atomic Energy Research Inst., Tokyo (Japan). Jan 1989. 52p. Order Number DE89790927/JAW. Available from NTIS (US Sales Only), PC A04/MF A01.

This report describes research activities of Osaka Laboratory for Radiation Chemistry, JAERI during one year period from April 1, 1986 through March 31, 1987. The latest report, for 1985, is JAERI-M 87-046. Detailed descriptions of the activities are presented in the following subjects: studies on surface phenomena under electron and ion irradiations; polymerization under the irradiation of electron beams; modification of polymers, degradation, cross-linking, and grafting.

36856 The aqueous chemistry of iodine. Toth, L.M. (Oak Ridge Nat. Lab., Oak Ridge, TN (US)); Pannell, K.D.; Kirkland, O.L. v.v of Proceedings of the American Nuclear Society meeting on fission-product behaviour and source term research. American Nuclear Society, La Grange Park, IL (1985). (CONF-8507160–: ANS meeting on fission product behaviour and source term research, Snowbird, UT, USA, 15-19 Jul 1985).

The chemistry of iodine has been examined in aqueous solutions of pH 6 to 10 containing 2500 p.p.m. boron as H_3BO_3 at (temperatures up to 150°C) using absorption spectrophotometry to identify and monitor the iodine species present. Kinetic rate constants for the disproportionation of the HOI intermediate, $3HOI \rightleftharpoons IO_3^- + 2I^- + 3H^+$, have been measured as a function of pH even though no direct spectral evidence for HOI itself has been observed. An HOI partition coefficient $>10^4$ has been estimated; results of ionic strength tests are consistent with HOI being present as an uncharged triatomic species in solution. Redox and radiation effects on the aqueous iodine chemistry have also been described.

36857 (INIS-mf–11445) **Guidelines for the practice of radiopharmacy.** Australian and New Zealand Society of Nuclear Medicine, North Melbourne (Australia). May 1988. 31p. Order Number DE89616655/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The main objective of the guidelines is to establish minimum standards for the practice of radiopharmacy in Australia and New Zealand. The guidelines are intended to provide a basis for the safe and efficient practice of radiopharmacy in a hospital or clinical environment. They cover premises in which radiopharmacy is practised; procurement and use of sealed and unsealed radioactive sources; radiopharmaceutical HOT LAB dose preparation; routine quality control procedures; dispensing of radiopharmaceuticals; distribution of radiopharmaceuticals; record keeping; basic radiation protection procedures; consultation and education; research and development; and the preparation of sterile radiopharmaceuticals.

36858 (INIS-SU–97, pp. 78-81) **Application of eda interactions for explaining and forecasting the extractive ability of elementoorganic reagents.** Laskorin, B.N. (AN SSSR, Moscow (USSR). Inst. Geokhimii i Analiticheskoj Khimii); Yakshin, V.V.; Filippov, E.A. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Consideration is given to applicability of the principle of free energy linearity for explamation and forecasting of extraction ability of organic phosphorous compounds (OPC) in the processes, proceeding according to the mechanism of electron donor-acceptor interactions. Linear equations with high correlation coefficients were obtained for the process of extraction of nitric acid, actinide (An=V, Np, Pu, Am) and zirconium nitrates by neutral OPC. These semiempirical equations, relating donor properties and OPC electronic structure with their extraction ability, enable to forecast rather reliably the behaviour of heterophase solvent extraction systems. 3 refs.; 2 tabs.

36859 (INIS-SU–97, pp. 62-69) **Prediction and control of extraction ability and some physico-chemical properties of extractants.** Rozen, A.M. (Vsesoyuznyj Nauchno-Issledovatel'skij Inst. Neorganicheskikh Materialov, Moscow (USSR)). AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Results of investigations on solvent extraction of metals, including rare earths and actinides, by different extractions are generalized. Methods of forecasting and regularities, responsible for extraction ability (EA) of mono- and bidentate neutral compounds, organic acids, crown-esters are discussed. Consideration is given to correlation EA dependences on various characteristics of extractant molecules, such as electronegativity of substituents of the active (donor) center, basicity constant, energy of internal levels of oxygen atom, ionization potential, affinity to proton and others. Possibility of directed regulation and improvement of some physicochemical properties of extractants is shown. 27 refs.; 8 figs.; 1 tab.

36860 (INIS-SU–97, pp. 123-126) **Thermodynamics of solvent extraction on $(C_8H_{17})_3N$-$C_6H_5CH_3$-UO_2Cl_2-HCl system.** Yigui Li (Tsinghua Univ., Beijing, BJ (China)); Jiufang Lu; Xunan Zhou; Teng Teng. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow,

USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Solvent extraction thermodynamics in the system n-trioctylamine-toluene-UO_2CL_2-HCl-water was considered. Pitzer equation and improved Frank-Thompson equation were used to calculate coefficients of electrolyte activity in aqueous phase. Activity coefficients of all components in organic phase were measured or calculated. Thermodynamic equilibrium constants of studied system were obtained. 7 refs.

36861 (INIS-SU–97, pp. 131-134) **Equilibrium on metal extraction with substituted ammonium salts effect of non-ideality of the organic phase.** Ochkin, A.V. (Moskovskij Khimiko-Tekhnologicheskij Inst., Moscow (USSR)). AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Consideration is given to equations, enabling to describe equilibrium in extractive systems, based on alkyl substituted ammonium salts (AAS) with allawance made for the effects of hydration, solvation and mutual influence of components in organic phase. These equations were used to analyze n-octanol effect on uranyl sulfate solvent extraction by tri-n-octylammonium sulfate solution in benzene. Quantitative estimation of alcohol effect on uranium distribution coefficient, as well as on decrease of hydration ratio of extractant due to AAS solvation by n-octanol is given. Calculation of decrease of the molar activity coefficient of extracted complex in AAS presence is considered for solvent extraction of cerium and europium nitrates by tridodecylammonium nitrate. 7 refs.; 1 tab.

36862 (INIS-SU–97, pp. 199-202) **Complexation and extraction of halogenoacetates in ternary systems salt-water-extractant.** Baluev, A.V. (Radievyj Inst., Leningrad (USSR)); Suglobova, I.G. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Consideration is given to results of investigations into uranyl halogenacetates, acetat and nitrate in ternary systems salt-water-extractant (diethyl ether or tributyl phosphate) at 25 deg C. Reciprocal solubility diagrams for uranyl salt systems are presented. Relationship between the character of phase diagram and anion properties at the fixed cation and extractant was revealed. Tendency to formation of the closed binodal curve correlates with hydration number and is connected with electron-donor ability. Deviations are explained satisfactorily by the difference in solvation numbers, which seems to be connected with steric effects. The data obtained show that relationship between anion characteristics and salt extraction ability is ambiguous. Edwards parameter should be used to obtain more accurate evaluations. 15 refs.; 4 figs.; 2 tabs.

36863 (INIS-SU–97, pp. 220-223) **Acceptor extraction of uranyl salts with mixtures of organophosphoric acids with neutral additives.** Torgov, V.G. (AN SSSR, Novosibirsk (USSR). Inst. Neorganicheskoj Khimii); Us, T.V.; Mikhajlov, V.A.; Stoyanov, Ye.S.; Drozdova, M.K.; Bogdanova, D.D. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Uranium solvent extraction by mixtures of organophosphoric acids (HX) with neutral additives (L) (phosphine oxides, sulfoxides, tbp) excibits, along with the widely known synergic effect at low HX saturation with uranium, a new synergic effect occurring after complete HX saturation. Three types of isotherms of uranyl salt extraction by benzene solutions of HX and mixtures of HX with L were revealed. Their forms depend on superposition of cation-exchange and noncation-exchange synergic effects. Similarity of synergic effect of acid and neutral mixture components during solvent extraction from diluted and concentrated solutions of uranyl salts testified to the same nature of these two effects; both of them are determined by acceptor properties of uranium atom in monomeric $UO_2(HX_2)_2$ and polymeric $(UO_2X_2)_n$ complexes. The established regularities were confirmed, when studying uranyl sulfate extraction by UO_2X_2 mixture with L. 2 refs.; 2 figs.; 1 tab.

36864 (INIS-SU–97, pp. 229-232) **Mechanism of extraction of uranium (6) by mixtures of phosphororganic extractants.** Skorovarov, D.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR)); Ul'yanov, V.S.; Meshcheryakov, N.M.; Lagutenkov, V.A.; Mikheev, M.V. AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Extraction of uranium (6) from sulfuric acid solutions by solution of D2EHPA-TBP(TOPO) mixture in CCl_4 was studied by NMR method (D2HPA-di-2-ethylhexylphosphoric acid, TBP-tributylphosphate, TOPO-trioctylphosphine oxide). It is shown that stability and stoichiometry of formed solvates depends largely on electron-donor ability of organophosphoric base (TBP or TOPO). The presence of neutral base in extractive system leads to blocking of the coordination center of free D2EHPA molecules, growth of the active acid concentration, assisting in additional solvation of uranyl D2EHP molecules and formation of $UO_2(D2EHP)_2$center dotnS type complexes. This results in extraction of additional U(6) quantities to organic phase. 2 refs.; 3 figs.

36865 (INIS-SU–97, pp. 256-259) **Some new developments in actinide solvent extraction systems.** Navratil, J.D. (New South Wales Univ., Kensington (Australia)). AN SSSR, Moscow (USSR). 1988. (CONF-8807136–: ISEC '88: international solvent extraction conference, Moscow, USSR, 18-24 Jul 1988). In *International solvent extraction conference. Vol. 1. Conference papers.* Order Number DE89012151/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

Consideration is given to application of neutral and acid organophosphoric compounds, adsorbed on various natural and synthetic carriers, in extraction chromatography for separation and isolation of actinides. It is shown that trioctylphosphine oxide (TOPO) on a solid combustible carrier represents the promising material for plutonium extraction. It was established experimentally that polyurethane foam possessed the maximal capacity with respect to TOPO; extractant losses at that after passing of 50 column volumes of nitric acid don't exceed 2 %. 11 refs.; 1 tab.

36866 (AD-A–205059/9/XAB) **Suppression of soot in flames by alkaline-earth and other metal additives.** Bonczyk, P.A. United Technologies Research Center, East Hartford, CT (USA). 1988. 24p. Available from NTIS, PC A03/MF A01.

Pub. in Combustion Science and Technology, Vol. 59, No. 143-163(1988).

Experiments were performed to clarify the role of metallic fuel additives in relation to soot suppression in a well-defined laboratory-scale diffusion flame. Principal emphasis was given to three alkaline-earth metals; namely, Ba, Sr and Ca. The experiments included Cu, Sn, Li, Na and K as well, but only to the extent that the latter contributed to under standing the details of alkaline-earth behavior. The additives were in the form of aqueous solutions of salts of the preceding metals. The solutions were aspirated into the oxidant flow of a nearly two-dimensional laminar C_2H_4/air flame emanating from a symmetric Wolfhard-Parker burner. Soot size, number density, and volume fraction were determined from Mie scattering.

36867 (CONF-8807172–1) **Bifurcation and pattern formation in combustion.** Bayliss, A.; Matkowsky, B.J.; Minkoff, M. Argonne National Lab., IL (USA). 1988. 61p. Sponsored by DOE/ER;OGA. DOE Contract W-31109-ENG-38;FG02-87ER25027. From 10. Dundee conference on differential equations; Dundee, UK; 4-8 Jul

1988. Order Number DE89013629/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

In our research program we employ a combination of analytical and numerical methods to determine the behavior of solutions of combustion problems. Specifically we consider highly nonlinear time dependent systems of partial differential equations which model the behavior of both solid and gaseous fuel combustion. In gaseous fuel combustion we are particularly interested in the transition from laminar to turbulent combustion, including a description of the intermediate stages of this transition. We have developed an adaptive pseudo-spectral method which is both very accurate and very efficient. Our algorithm allows us to describe the solution on bifurcation branches, well beyond the region where analytical methods work well. We have however taken advantage of the analytical results that we first obtain, to aid us in choosing appropriate parameter values and initial conditions for the numerical computations. In addition the analytical results serve as benchmarks for our computations. The computations reveal new and interesting behavior, not otherwise obtainable. Below we discuss two problems, involving solid and gaseous fuel combustion respectively. 26 refs., 12 figs.

36868 (DOE/ER/13544–T2) **Laser spectroscopy and dynamics of combustion intermediates: Three year progress report, 1 June 1986–31 May 1989.** Clouthier, D.J. Kentucky Univ., Lexington, KY (USA). Dept. of Chemistry. Oct 1988. 10p. Sponsored by DOE Energy Research. DOE Contract FG05-86ER13544. Order Number DE89014498/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The research originally proposed under this grant concerned the study of the spectroscopy and excited state dynamics of a number of transient sulfur-containing molecules and free radicals. It was suggested that the identification and study of sulfur species which are analogs of important oxygen-containing combustion intermediates would be important to our understanding of reactive intermediates. The specific systems chosen for study were thioformaldehyde (H_2CS), thioketene (H_2CCS), disulfur monoxide (S_2O), and the free radical HCCS, C_2S and HCS. Since most of the species had not been previously studied by laser techniques and some of them were completely unknown, much effort has been devoted to determining methods for producing and observing them. We have been successful in a number of studies and have developed a new technique called pyrolysis jet spectroscopy which promises to be widely applicable. A detailed description of progress in each area is given. 14 refs.

Packages designed to carry spent fuel within the United States must be approved and certified by the Nuclear Regulatory Commission (NRC). This is done by submitting an application to the NRC that describes the package design and provides a detailed technical evaluation of its performance under a variety of normal and accident conditions. These technical evaluations are often based on a combination of theoretical analysis and experimental testing that can be particularly important if it is necessary to corroborate specific analytical assumptions or confirm the methodology used. Tests can be applied to full-scale prototypes or scale model packages, either of which can frequently provide the necessary evidence to substantiate the conclusions. This report discusses two types of packages that were tested at the Oak Ridge National Laboratory – a scale model spent fuel cask and a full-scale canister designed to be carried inside a spent fuel cask. They were designed by two private companies. Both companies applied to the NRC for a Certificate of Compliance for their casks. In both cases, the combination of testing and analysis, and the way it was applied, formed a critical part of their application. 7 refs., 2 figs., 1 tab.

36870 (DOE/CE/15316–T3) **Laser based machine for die and prototype manufacturing: Final report, February 10, 1987–August 9, 1988.** Feygin, M. Hydronetics, Inc., Chicago, IL (USA). 5 Feb 1989. 17p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract FG01-87CE15316. Order Number DE89009115/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In his application to the Bureau of Energy Related Inventions Michael Feygin proposed a feasibility study for a new process aiming at completely automated manufacturing of complex and hard to manufacture parts. The technique invented by Michael Feygin is called Laminated Object Manufacturing. It utilizes thin cross-sections of a part, cut by a laser based contouring machine. The part is created by successive deposition and bonding of layers of material. Part geometry is specified by successive cross-sectioning of 3-dimensional images created with a CAD program on a graphic workstation. The Laminated Object Manufacturing system can be thought of as a "three-dimensional-printer" which incrementally stacks two-dimensional images. The ultimate hard copy is produced, the object itself. The laser system is basically an assembly of known technologies: laser cutting, CAD and CAM, brazing or adhesion bonding, and computer controlled mechanical handling of components. It offers a revolutionary new way to produce 3-dimensional objects such as molds, dies, prototypes, models and other items produced in small batches. The research performed on the grant created a foundation for building a successful prototype of a LOM system. The prototype has been built in 1988 using funds of the Illinois Innovation Fund, a state agency independent from DOE. 8 figs., 1 tab.

36871 (GA-A–19416) **GACAP: A new computer code for analysis of symmetric and nonsymmetric cask cross sections.** Shatoff, H.; Koploy, M. General Atomics, San Diego, CA (USA). Jun 1989. 11p. Sponsored by DOE Radioactive Waste Management. DOE Contract AC07-88ID12698. (CONF-890631–54: International symposium on packaging and transporting of radioactive materials, Washington, D.C., USA, 11-16 Jun 1989). Order Number DE89014250/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

General Atomics (GA) is designing two legal weight truck casks to transport spent fuel for the Office of Civilian Waste Management. Regulations in 10CFR71 require that they be evaluated for impacts on unyielding surfaces for normal transport and hypothetical accident conditions. To analyze the impacts of the casks, GA developed a new two-dimensional dynamic computer code capable of evaluating the dynamic response of symmetric and nonsymmetric casks during impacts. The code utilizes lumped masses with elastic beams to model the cask structure. It assumes small deformations in the cask structure and performs an explicit step-by-step integration using the central difference method. Load versus deflection tables represent the variation of in-plane cask angles of impact along with the rotated position of the cask axis. The code performs a two-way interpolation of the tables for intermediate angles. Impact forces are always normal to the impact plane. The user controls the location of the impact forces along with the effect of friction at impact. The user also has control of the amount of shear deformation allowed in the beams. Multiple beam cross sections can be imposed in the same segment. The user can either have the code calculate the properties of circular or rounded corner box sections or can input direct stiffness properties. The input is all in free format and very user friendly. 2 refs., 5 figs., 1 tab.

Voprosy atomnoj nauki i tekhniki.; no. 3.

Consideration is given to a design of recharging container, designated for transportation of γ-active samples in a chain of cameras. Permissible activity in the container is 100 radium equivalent (at E_γ=1.25 MeV), thickness of biological shielding (for lead) is 200 mm. Overall dimensions: diameter-950 mm, heigh-2060 mm. Container mass is 7800 kg. The container provides for high reliability of maintenance and adjustment. 3 figs.

36876 (INIS-SU–84/A, pp. 57-66) **Chamber for storage and recharging.** Sinitsyn, O.A.; Kopylov, V.I. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1987. (In Russian). In *Design and construction. Voprosy atomnoj nauki i tekhniki.; no. 3.

Chamber for recharging sealed sources of ionizing radiations from transport containers to technological ones and devices, as well as for intermediate source storage is described. 3 refs.; 4 figs.

36877 (INIS-SU–86/A, pp. 24-26) **Hydrogen isotopes effect on efficiency of helium cryosorption pumping out by argon condensed layers.** Rabin, A.A.; Svishchev, V.S. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Thermonuclear synthesis. Scientific-technical collection.* Order Number DE89012166/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 3.

The effect of hydrogen (H_2 and D_2) isotopes on the efficiency of helium cryosorptional pumping out by argon layers, condensed at the temperature of 4.2 and 2 K is investigated. Dependences of helium adhesion coefficients ν_{He} on the value of its concentration in sorbent layer for different amounts of preliminarily adsorbed H_2 and D_2 also in case of hydrogen-helium mixture pumping out are obtained. In case of T=4.2 K the differences in the effect of H_2 and D_2 on the value of ν_{He} are insignificant and stay within measurement error, for D_2 a weaker effect at T=2 K is detected. Results of the work confirm the necessity of separate pumping out of hydrogen and helium by the use of cryosorption on the layers of condenced gases in a thermonuclear reactor and permit to determine admissible amounts of hydrogen in the pumped out mixture and in the layer of sorbent without noticeable deterioration of pumping-out properties as regards helium. 7 refs.; 3 figs.

36878 (LA-UR–89-2138) **Prototype testing for a hybrid gas-gun/railgun device.** Parker, J.V. Los Alamos National Lab., NM (USA). 1989. 19p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890710–11: 5. international conference on megagauss magnetic field generation and related topics, Novosibirsk, USSR, 3-7 Jul 1989). Order Number DE89014294/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In 1984 Los Alamos began the design of the lethality test system (LTS), a facility to be used for the study of impact physics at velocities up to 15 km/s. The key component of LTS was an electromagnetic launcher capable of accelerating a 30 gram mass to 15 km/s. By the time of the Preliminary Design Review (July 1985) it was known from laboratory experiments that a conventional railgun was incapable of reaching 15 km/s starting at low velocity (~1 km/s) and a hybrid design was adopted for the LTS launcher. The hybrid launcher consisted of a two-stage hydrogen gun that preaccelerated the test mass to 6.5 km/s and an electromagnetic launcher for the final acceleration from 6.5 to 15 km/s. Design calculations predicted that injection into the railgun at 6.5 km/s would reduce ablation sufficiently to permit operation at 12 km/s with reasonable probability of achieving 15 km/s. The hybrid launcher design adopted for LTS presents some unique mechanical and electrical issues. In particular, the hybrid design requires that the plasma armature be established in a high pressure gas environment behind the projectile. To address this issue, as well as to evaluate the mechanical and electrical design, an 1.83 meter long prototype of the electromagnetic launcher barrel was built and tested. This paper describes the prototype launcher tests and the performance achieved. In addition, testing of a plasma initiator operating in a high pressure gas environment is discussed. 5 refs., 11 figs., 1 tab.

36879 (MLM–3597) **Computer aided process planning conceptual design and functional specification.** Burke, J.A. EG and G Mound Applied Technologies, Miamisburg, OH (USA). 23 Jun 1989. 22p. Sponsored by DOE Defense Programs. DOE Contract AC04-88DP43495. Order Number DE89013738/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This document is a compilation of Mound's research effort to define computer aided process planning, a system that will automate the function of creating, maintaining, and using manufacturing documentation or process plans. Studies show that the implementation of this system will require the redefinition of engineering functions and practices. It will also require a system to automate and integrate these activities into the existing capabilities and expected paybacks are discussed. Finally, some implementation issues are pointed out for further evaluation and consideration at a future time. 3 figs., 1 tab.

36880 (ORNL–6525) **Oak Ridge National Laboratory Health and Safety Long-Range Plan: Fiscal years 1989–1995.** Oak Ridge National Lab., TN (USA). Jun 1989. 189p. Sponsored by DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89014570/JAW. Available from NTIS, PC A09/MF A01 - OSTI; GPO Dep.

The health and safety of its personnel is the first concern of ORNL and its management. The ORNL Health and Safety Program has the responsibility for ensuring the health and safety of all individuals assigned to ORNL activities. This document outlines the principal

aspects of the ORNL Health and Safety Long-Range Plan and provides a framework for management use in the future development of the health and safety program. Each section of this document is dedicated to one of the health and safety functions (i.e., health physics, industrial hygiene, occupational medicine, industrial safety, nuclear criticality safety, nuclear facility safety, transportation safety, fire protection, and emergency preparedness). Each section includes functional mission and objectives, program requirements and status, a summary of program needs, and program data and funding summary. Highlights of FY 1988 are included.

36881 (SAND–88-3057C) **Damage predictions for wind turbine components using the LIFE2 computer code.** Sutherland, H.J. Sandia National Labs., Albuquerque, NM (USA). 1989. 6p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-890717–1: European wind energy conference and exhibition, Glasgow, UK, 10-13 Jul 1989). Order Number DE89013813/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The LIFE2 computer code is a fatigue/fracture analysis code that is specialized to the analysis of wind turbine components. It is a PC-compatible FORTRAN code that is written in a top-down modular format. The service lifetime of a component can be divided into three phases: crack initiation, growth and coalescence of microcracks and growth of a macro-crack. In the LIFE2 formulation, a "S-n fatigue" analysis is used to describe the first two phases and a linear, "da/dn" fracture analysis is used to describe the third phase. The code is divided into five main sections. The first four describe the wind resource, the constitutive properties of the turbine material, the stress state in which the turbine operates and operational parameters for the turbine system. The fifth uses the data files written by the first four sections to calculate the service lifetime of a turbine component. In addition to the main sections, auxiliary sections are included to permit the storage of data and code calculations and to permit the plotting of results. This report describes the computational framework used in the LIFE2 code to evaluate the damage rules cited above. An example problem is presented here to illustrate the capabilities of the code.

36882 (SAND–88-3169C) **Jitter improvement of the 12-MV oil switches on Aurora.** Warren, F.T.; Hammon, H.G.; Turman, B.N.; Prestwich, K.R. Sandia National Labs., Albuquerque, NM (USA). 1989. 20p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-890665–19: 7. Institute of Electrical and Electronics Engineers pulsed power conference, Monterey, California, USA, 12-14 Jun 1989). Order Number DE89013809/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Aurora Prompt Gamma Flash Simulator has been undergoing a series of machine upgrades in response to recent simulation requirements. One outgrowth of these new requirements is the need for improved synchronization of the four Blumlein modules. Physics International and Sandia National Laboratories have developed and tested an innovative oil-switch trigger scheme consisting of a charged transmission line pulse generator switched by a 3-MV, electrically-triggered, Rimfire gas switch. Recently, we have tested the oil switch trigger pulser on one of the 12-MV, Blumlein oil switches. In these tests, we have achieved shot-to-shot jitter of 5 ns. By comparison, jitter of the present trigger scheme has been measured to be 10 ns. In this paper, we will discuss the jitter-reduction techniques, the design of the low-jitter, oil switch trigger pulser, and the tests results achieved on Aurora. 9 refs., 9 figs., 3 tabs.

36883 (SAND–88-3271) **TRUPACT I filter development: Status report.** Kincy, M.A.; Joseph, B.J.; Humphreys, D.L. Sandia National Labs., Albuquerque, NM (USA). Jun 1989. 66p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. (TTC–0891). Order Number DE89014573/JAW. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

This report describes the development of the TRUPACT-I Filtered Pressure Equalization System (FPES). The approach taken in establishing performance requirements for the FPES and the results of the qualification tests are presented. 15 refs., 39 figs., 4 tabs.

36884 (SAND–88-8934) **Development of a thin wall graphite/polyimide composite pressure vessel with a large aspect ratio.** LaJeunesse, C.A.; Trinh, K.V.; Bartel, J.J.; Spingarn, J.R. Sandia National Labs., Albuquerque, NM (USA). Oct 1988. 32p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DR00789. (CONF-890721–1: Joint ASME/JSME pressure vessel and piping conference, Honolulu, Hawaii, USA, 23-27 Jul 1989). Order Number DE89002536/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A graphite/polyimide composite pressure vessel has been developed to contain corrosive gas mixtures up to 400 psig and 300°F. The goal of this research project was to develop a lightweight, thin-walled, composite pressure vessel with an l/d aspect ratio of 42 capable of containing hydrogen fluoride (HF) and chlorine trifluoride (ClF_3). The vessel was to have a crown radius approaching infinity, a desired knuckle radius approaching zero, and a desired wall thickness of 0.023 in. In this paper the problems encountered and the iterative solutions in addition to the design, analysis, and fabrication of the vessel are presented. 3 refs., 14 figs., 2 tabs.

36885 (SAND–88-8935) **Nonlinear dynamic response of pressurized composite bottles subjected to shock loading.** Trinh, K.V.; Weingarten, L.I. Sandia National Labs., Livermore, CA (USA). Mar 1989. 29p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DR00789. (CONF-890721–26: Joint ASME/JSME pressure vessel and piping conference, Honolulu, Hawaii, USA, 23-27 Jul 1989). Order Number DE89010553/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A combined experimental and analytical program has been developed to examine the structural dynamic response of pressurized composite bottles subjected to spatially localized loadings. These bottles were constructed from graphite/epoxy, Kevlar/epoxy and fiberglass/epoxy. Some bottles also contained mock solid propellant. The impulsive, exponentially decaying shock loads were applied using blast tube techniques. Dynamic response analyses of the bottles were performed using the finite element code ABAQUS. A damage model was developed to account for material degradations due to the progressive failures of the composite material. The report presents the comparisons between results obtained from experiments and analytical methods. 3 refs., 11 figs., 5 tabs.

36886 (SAND–89-1113C) **Design of an advanced entry control system.** Williams, J.S.; Miller, D.W. Sandia National Labs., Albuquerque, NM (USA). 1989. 6p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-890736–7: 30. annual meeting of the Institute of Nuclear Materials Management, Orlando, FL, USA, 9-12 Jul 1989). Order Number DE89014781/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

An entry control system (ECS) allows the movement of authorized personnel and material through normal routes while detecting and delaying movement of unauthorized personnel and contraband. This paper presents an overview of several unique design and operating principles used in the implementation of a positive identity entry control system utilizing proximity cards. The system design incorporates distributed processing to support geographically separated entry points and redundancy such that no single point failure will shut down operations. The functionality and integration of the photo identification system, the visitor authorization system, and the access control and contraband detection systems will be discussed. Systems unique features such as temporary badge issue for lost or forgotten badges at entry points using video lookup, visitor processing, and ergonomic and environmental considerations for the design of the proximity card based entry lane will be covered. 6 figs.

36887 (SAND–89-1212C) **A wind shielded fire test facility.** Keltner, N.R.; Kent, L.A. Sandia National Labs., Albuquerque, NM (USA). 1989. 9p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-890631–53: International symposium on packaging and transporting of radioactive materials, Washington, DC, USA, 11-16 Jun 1989). Order Number DE89014483/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Sandia National Laboratories has utilized pool fires to subject military components and radioactive material shipping containers to postulated transportation accident environments for over thirty years. Because these are usually very high value items, there is typically a single fire test. Because wind produces the biggest, uncontrollable effect on the thermal environment of open pool fires,

there is a risk of an invalid test if winds develop during the test. For example, IAEA regulations specify the average speed must be less than 2 m/s. To reduce weather related risks during small fire tests, several wind shielded test facilities have been developed. In developing these facilities, it was necessary to demonstrate that they closely simulated the environment in a large open pool fire. Recently, a project was undertaken to develop a new facility that could reproduce the thermal environment of an open pool fire and comply with air quality regulations. The design of the facility is based on a scale-up of an existing facility that was used to develop methods for reducing emissions while maintaining the appropriate thermal conditions. 5 refs., 5 figs.

36888 (SAND–89-1312C) **Investigation of cask contamination weeping: A progress report.** Bennett, P.C. Sandia National Labs., Albuquerque, NM (USA). 1989. 11p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-8904225–1: IAEA Technical Committee meeting on decontamination of transport casks and spent fuel storage facilities, Vienna, Austria, 4-7 Apr 1989). Order Number DE89013492/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Spent fuel transportation casks have arrived at final destinations with removable surface contamination levels in excess of regulatory limits, although pre-transport surveys indicated removable contamination levels were well below these limits. The control of this in-transit "weeping" of surface contamination on pool-loaded spent fuel transport casks is of particular concern to both the US Department of Energy (DOE) and the US Nuclear Regulatory Commission (NRC). Weeping, also known as sweating, is the transformation of fixed radioactive particulates on an exterior surface of transport cask to a removable state. Weeping has been observed sometime after a cask is removed from a fuel pool and decontaminated. The weeping phenomenon is countered by time-consuming operational constraints and procedures which have a significant impact on cask turnaround times and occupational exposures at transport facilities. Further, the arrival of a contaminated cask results in negative public perceptions that are inconsistent with DOE and NRC goals. The objectives in resolving the technical issue of weeping are to identify specific causes of the weeping phenomenon, then to implement new cask design requirements and supporting operational procedures which will limit or inhibit the accumulation, retention, and in-transit conversion of fixed surface contamination. 6 figs., 1 tab.

36889 (SAND–89-1402) **Numerical analysis of designs to reduce the kinetic energy of Davis Gun pusher plates.** Young, E.R.; Norwood, F.R. Sandia National Labs., Albuquerque, NM (USA). Apr 1989. 50p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE89014571/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Computer simulations, using the hydrocode HULL, were performed to analyze a method to discard the sabot and the effectiveness of several designs in reducing the kinetic energy of pusher plates for Davis Gun systems. This study assumed an axisymmetric impact of the pusher plate on one metal and multi-metal annual plates. Based on these simulations, a four petal sabot that is mechanically attached to the penetrator and an aluminum-steel composite target plate are recommended. 12 refs., 27 figs.

36890 (SAND–89-1587C) **TRACE - Tamper Resistant Authenticated Camera Enclosure.** Skogmo, D. Sandia National Labs., Albuquerque, NM (USA). 1989. 7p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-890736–20: 30. annual meeting of the Institute of Nuclear Materials Management, Orlando, FL, USA, 9-12 Jul 1989). Order Number DE89014186/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

To protect a security instrument such as a television camera from subversion by signal substitution, the data from the instrument are digitized and submitted to an authenticator. The digital data may then be transmitted in the clear over a non-secure medium. Appended to the data is a 10-bit authentication value based on the values of the data and a random authentication number. At the receiving end, the data are submitted to an identical authenticator. If it produces the same authentication value, the data are authentic. Such a scheme can only work if the instrument, the authenticator, and the link between them can be protected from tampering. This paper describes a tamper resistant container designed to protect a data authenticator and television camera against an adversary having sophisticated resources and complete design information. The container's design includes active elements to detect and report intrusion attempts in real time. It also includes passive elements to indicate upon later inspection that the container had been violated. 1 ref., 2 figs.

36891 (SAND–89-1594C) **The PVF2 piezoelectric polymer shock stress sensor: System characterization for application under field test conditions.** Reed, R.P.; Greenwoll, J.I. Sandia National Labs., Albuquerque, NM (USA). 1989. 24p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-8906133–3: 15. transducer workshop, Cocoa Beach, FL, USA, 20-22 Jun 1989). Order Number DE89014629/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The piezoelectric polymer, polyvinylidene di-fluoride (PVDF or PVF2), properly processed by the proprietary Bauer technique, is a material for a transducing element that can be used for a wide variety of stress, pressure, or temperature related measurements. Its versatility as a sensor requires especially careful attention to the special requirements for associated gauge packaging, installation, signal conditioning, recording, and analysis that are imposed by the particular diverse test conditions. Most applications reported to date have been for tests performed under laboratory conditions. But, the PVDF sensor has also been successfully used for stress wave measurement under adverse and often hostile field test conditions that require the use of lengthy transmission lines and allow only limited recording capability. This paper discusses one crucial aspect of field application – measuring system characterization, and correction of signals distorted by systems of marginal frequency capability. 11 refs., 7 figs.

36892 (SAND–89-1616C) **Field evaluation of new exterior video motion detection systems.** Malone, T.P. Sandia National Labs., Albuquerque, NM (USA). 1989. 23p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-890736–25: 30. annual meeting of the Institute of Nuclear Materials Management, Orlando, FL, USA, 9-12 Jul 1989). Order Number DE89014515/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Considerable interest has been generated within the past several years concerning the use of new generation video motion detection (VMD) systems as exterior intrusion sensors. The new generation VMD systems advertise advanced video signal processing techniques and algorithms which are aimed at rejecting nuisance alarm sources inherent to the uncontrolled exterior environment. Older generation VMD systems used in an exterior environment tend to have high nuisance alarm rates. The high nuisance alarm rates of the older systems made them generally unacceptable for use as an exterior sensor. This paper discusses the results of continued field testing of new generation VMD systems. Field tests were conduced in an exterior perimeter zone application and an application looking at the exterior entrance of a building. Test results include each VMD system's detection capabilities and nuisance alarm characteristics for each particular application. Also site considerations such as lighting, cameras and zone layouts for exterior video motion detection are discussed. 1 ref., 14 figs., 1 tab.

36893 (UCID–19592-Rev.5) **DYNA3D user's manual: (Nonlinear dynamic analysis of structures in three dimensions): Revision 5.** Hallquist, J.O.; Whirley, R.G. Lawrence Livermore National Lab., CA (USA). May 1989. 201p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE89014304/JAW. Available from NTIS, PC A10/MF A01 - OSTI; GPO Dep.

This report provides an updated user's manual for DYNA3D, an explicit three-dimensional finite element code for analyzing the large deformation response of inelastic solids and structures. A contact-impact algorithm permits gaps and sliding along material interfaces with friction. Using a specialization of this algorithm, such interfaces can be rigidly tied to admit variable zoning without the need of transition regions. Spatial discretization is achieved by the use of 8-node solid elements, 2-node beam elements, 4-node shell elements, 8-node solid shell elements, and rigid bodies. The equations-of-motion are integrated in time by the central difference method. The

1989 version of DYNA3D contains thirty material models and ten equations of state to cover a wide range of material behavior.

36894 (UCRL–100757) **The analysis of lead slump effects in shipping casks for radioactive materials.** Mok, G.C.; Chun, R.C.; Lo, T.Y.; Witte, M.C. Lawrence Livermore National Lab., CA (USA). Mar 1989. 12p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-890721–18: Joint ASME/JSME pressure vessel and piping conference, Honolulu, Hawaii, USA, 23-27 Jul 1989). Order Number DE89009952/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Lead shields are commonly used to control the radiation of packages containing radioactive materials. Having low strength, the shields deform easily under loads, therefore losing their capability to control radiation. This paper examines this problem for a circular cylindrical shipping cask, whose lead shield is encased between two steel cylinders. To this end, the paper describes the deformation of the lead shield under impact loads and its effects on the shielding capability and on the stresses in the steel cylinders. The paper details a simplified mathematical theory for the quantitative evaluation of these effects. The validity of the theory is demonstrated by comparing the numerical results of this method to those of tests and sophisticated finite-element analyses. The method has been implemented in a computer program, called SCANS (Shipping Cask ANalysis System), for shipping cask analysis. Developed for the US Nuclear Regulatory Commission and the Department of Energy, the program may be obtained from the Argonne National Software Center. 7 refs., 8 figs., 5 tabs.

36895 Superconducting Magnetic Energy Storage. Hassenzahl, W. (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA (US)). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 750-758 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

Recent programmatic developments in Superconducting Magnetic Energy Storage (SMES) have prompted renewed and widespread interest in this field. In mid 1987 the Defense Nuclear Agency, acting for the Strategic Defense Initiative Office issued a request for proposals for the design and construction of SMES Engineering Test Model (ETM). Two teams, one led by Bechtel and the other by Ebasco, are now engaged in the first phase of the development of a 10 to 20 MWhr ETM. This report presents the rationale for energy storage on utility systems, describes the general technology of SMES, and explains the chronological development of the technology. The present ETM program is outlined; details of the two projects for ETM development are described in other papers in these proceedings. The impact of high Tc materials on SMES is discussed.

36896 CEBAF, a large scale application of superconducting rf. Chargin, A.K. (CEBAF (US)). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 769 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The Continuous Electron Beam Accelerator Facility (CEBAF) is a 4 GeV, multipass, CW accelerator. The machine is racetrack shaped with the linac split into two equal parts located in the straight sections. The recirculating magnets, which will guide the beam through four passes around the accelerating structure, are in the arc sections connecting the two linacs. At the end of the accelerator, the beam passes into the switchyard where it is guided into any of three experimental end stations. The linac consists of 418 Nb superconducting rf cavities operating at 1500 MHz to produce a high quality beam having a 100% duty cycle with an energy spread of 10^{-4} and emittance of 10^{-9} m. The operating temperature of the linac is 2K, based on a cost trade off between increasing rf heat loads with an increase in temperature, and an increasing cost of refrigeration to decrease temperature. A pair of High Resolution Spectrometers in Hall A and a high acceptance, high energy electron spectrometer in Hall C will utilize superconducting dipoles and quadrupoles. The Large Acceptance Spectrometer in Hall B is a six coil superconducting toroid.

36897 Flux noise and flux creep in YBCO thin films. Ferrari, M.J. (Dept. of Physics, Univ. of California, Lawrence Berkeley Lab., Berkeley, CA (US)); Johnson, M.; Wellstood, F.C.; Clarke, J.; Rosenthal, P.A.; Hammond, R.H.; Beasley, M.R. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 806-889 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The authors have a dc SQUID to measure the low-frequency magnetic flux noise produced by thin-film rings of $YBa_{p2}Cu_3O_{7-\delta}$ (YBCO) with various microstructures. Below the transition temperature T_c of the YBCO, the spectral density of the noise scales as 1/f (f is the frequency) from 1 Hz to 1 kHz. This noise generally increases with temperature and vanishes abruptly at T_c. Improvements in crystalline microstructure dramatically reduce the magnitude of the noise, which was lowest for a highly oriented sample with its c-axis perpendicular to the substrate. Making a radial cut to interrupt current paths around the sample ring does not significantly affect the magnitude of the noise, demonstrating that the noise arises from a local mechanism such as the thermally activated hopping of flux bundles. Flux creep was observed in one sample cooled in a magnetic field of 1 mT, and the creep rate exhibited a sharp maximum near 80 K. The authors conclude that SQUIDs and flux transformers of YBCO must be fabricated from highly oriented films to obtain low noise at low frequencies.

36898 Single superconducting thin film devices for applications in high T_c materials circuits. Martens, J.S. (Univ. of Wisconsin-Madison, Dept. of Electrical and Computer Engineering, Madison, WI (US)); Beyer, J.B.; Nordman, J.E.; Ginley, D.S.; Hohenwarter, G.K.G.; McGinnis, D.P. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 954-956 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The authors have investigated several different devices based on regions of weak superconductivity and multiple parallel links in thin films. Hysteretic symmetric and asymmetric IV curves have been observed. Flux flow was indicated. Device switching properties and the dependence of the flux flow signature in the IV curve on applied magnetic field were explored. Both Nb and high T_c thin films were used in circuit fabrication. Contrary to vortex flow devices based on Josephson junctions those described here do not possess a tunneling barrier and are made of only a single superconducting layer. Hence they should be applicable to electronic circuits based on high T_c superconducting materials without the need for tunnel junctions.

36899 Characterization of YBaCuO and ErBaCuO thin films deposited on silicon and gallium arsenide substrates. Chin, D.K. (Dept. of Electrical Engineering and Computer Science and the Electronics Research Lab., Univ. of California, Berkeley, CA (US)); VanDuzer, T.; Hansen, W.L.; Yu, K.M.; Stickle, W.F.; Lee, S.Y.; Murdock, B. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 961-964 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

YBaCuO and ErBaCuO films have been deposited on Si substrates with and without a ZrO_2 buffer layer and on GaAs substrates by RF diode sputtering from stoichiometric oxide targets. The films and interface between the films and semiconductor substrates are analyzed by Rutherford backscattering spectrometry (RBS), X-ray fluorescence spectroscopy (XRF), Auger electron spectroscopy (AES), energy dispersive X-ray spectrometry (EDAX), and scanning electron microscopy (SEM). The films grown on Si substrates with a ZrO_2 buffer layer show superconductivity above 65 K and no significant interaction at the interface is observed. High-T_c films can be obtained either by slow furnace annealing or by rapid heat-pulse annealing. No significant interaction is observed between YBaCuO (ErBaCuO) and GaAs after rapid thermal annealing at temperatures below 750^0C.

36900 Low frequency resistance fluctuations in films of high temperature superconductors. Rosenthal, P. (Dept. of Applied Physics, Stanford Univ., Stanford, CA (US)); Hammond, R.H.; Beasley, M.R.; Leoni, R.; Lerch, P.; Clarke, J. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 973-975 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

Low frequency voltage fluctuations in thin films of $YBa_2Cu_cO_{7-x}$ at and above the superconducting transition have a spectral density $S_v(f)$ proportional to V-bar^2/f, where V-bar is the average voltage across the film and f is the frequency. The value of $S_v(f)$/V-bar^2 decreases markedly as the microstructure of the films is improved. In contrast to classic superconductors, the noise at the resistive transition does not arise from equilibrium temperature fluctuations.

36901 A film transmission line resonator to measure the microwave surface resistance of $YBa_2Cu_3O_{7-x}$. Martens, J.S. (Dept. of Electrical and Computer Engineering, Univ. of Wisconsin-Madison, Madison, WI (US)); Hohenwarter, G.K.G.; Beyer, J.B.; McGinnis, D.P.; Ginley, D.S. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 984-986 (Mar 1989). (CONF-880812--: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The authors have constructed microstrip transmission line resonators with $YBA_2Cu_3O_{6.9}$ ground planes, SiO dielectric and Nb top conductors. The film resonator is a low impedance section $n\lambda/2$ long, and the wave is launched from a coax line. Loose coupling is provided by the discontinuity between 50 Ω feed lines and the .05 Ω resonator section. After de-embedding the transmittance data of the structure, the surface resistance of the ceramic superconductor can be computed. The surface resistance of $YBa_2Cu_3O_{6.9}$ at 4.2K was about a factor of 60 higher than that of theoretical Nb at 4.2K over the range of 2.9-6 GHz. The power law behavior versus frequency of the surface resistance is roughly quadratic as is consistent with two-fluid analysis.

36902 RF electromagnetic investigation of an $YBa_2Cu_3O_7$ thin film by proximity coupling. Baum, H.P. (Physics Dept., Univ. of Wisconsin-Milwaukee, Milwaukee, WI (US)); Schenstrom, A.; Zheng, Y.; Sarma, B.K.; Levy, M.; Kang, J.H.; Kampwipth, R.T. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 987-989 (Mar 1989). (CONF-880812--: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The authors report here an investigation of the RF electromagnetic (e-m) attenuation by a $YBa_2Cu_3O_7$ thin film at 1 GHz, as a function of temperature. An increase in the RF e-m attenuation was observed as the temperature was decreased below the superconducting transition temperature $T_c \simeq 84$ K, followed by a rapid decrease at lower temperature (–25 K). A theoretical analysis of e-m absorption is evoked to compare it with the experimental results.

36903 Hot electron effect in the dc SQUID. Wellstood, F.C. (Dept. of Physics, Univ. of California, and Materials and Chemical Sciences Div., Lawrence Berkeley Lab., Berkeley, CA (US)); Clarke, J.; Urbina, C. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1001-1004 (Mar 1989). (CONF-880812--: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The authors have investigated the temperature dependence of the noise in thin-film dc Superconducting Quantum Interference Devices (SQUIDs) down to 20 mK. The white noise measured in the early versions of our SQUIDs did not decrease as the bath temperature was lowered below 150 mK. They have attributed this saturation to a hot electron effect in the thin-film AuCu resistors shunting the Josephson junctions. A theoretical investigation showed that the temperature of the electrons in the shunts should be given by $T_e = (P/\Sigma\Omega)^{1}5/$, where P is the power dissipated in the shunts, Ω is the shunt volume, and Σ is a proportionality constant. Experimentally, the authors found $\Sigma=(2.4\pm0.6)X10^9WK^{-5}m^{-3}$. They have redesigned the shunts, adding large thin-film cooling fins, to increase their volume substantially. This technique has reduced T_e to about 50 mK, with a corresponding improvement in the sensitivity of the SQUIDs.

36904 Design of variable phase velocity kinetic inductance delay lines and their measured characteristics when fabricated by a simple Nb based process. Martens, J.S. (Dept. of Electrical and Computer Engineering, Univ. of Wisconsin-Madison, Madison, WI (US)); Beyer, J.B.; Nordman, J.E.; Hohenwarter, G.K.G.; McGinnis, D.P. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1100-1103 (Mar 1989). (CONF-880812--: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

A simple design of superconducting kinetic inductance delay lines is presented. Delay lines were fabricated with a thin-film process involving only dc magnetron deposition and anodization of Nb. Phase velocity measurements demonstrated wave slowing to less than 1/150 of the velocity of light in free space with associated impedances in the Ohm range. Phae velocity changes on lines which were in physical proximity of long Josephson junctions and normal conducting lines were investigated. Variations larger than 10% of the equilibrium value were observed with junction coupled lines under bias application. Locally heated lines exhibited changes exceeding a factor of two. Loss and phase velocity were determined as a function of bias conditions in both cases.

36905 Nuclear magnetic resonance with dc SQUID preamplifiers. Fan, N.Q. (Dept. of Physics, Univ. of California, and Materials and Chemical Sciences Div., Lawrence Berkeley Lab., Berkeley, CA (US)); Heaney, M.B.; Clarke, J.; Newitt, D.; Wald, L.L.; Hahn, E.L.; Bielecki, A.; Pines, A. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1193-1199 (Mar 1989). (CONF-880812--: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

Sensitive radio-frequency (rf) amplifiers based on dc Superconducting QUantum Intererference Devices (SQUIDSs) are available for frequencies up to 200 MHz. At 4.2 K, the gain and noise temperature of a typical tuned amplifier are 18.6±0.5 dB and 1.7±0.5 K at 93 MHz. These amplifiers are being applied to a series of novel experiments on nuclear magnetic resonance (NMR) and nuclear quadrupole resonance (NQR). The high sensitivity of these amplifiers was demonstrated in the observation of nuclear spin noise, the emission of photons by ^{35}Cl nuclei in a state of zero polarization. In the more conventional experiments in which one applies a large rf pulse to the spins, a Q-spoiler, consisting of a series array of Josephson junctions, is used to reduce the Q of the input circuit to a very low value during the pulse. The Q-spoiler enables the circuit to recover quickly after the pulse, and has been used in an NQR experiment to achieve a sensitivity of about 2×10^{16} nuclear Bohr magnetons in a single free precession signal with a bandwidth of 10 kHz. In a third experiment, a sample containing ^{35}Cl nuclei was placed in a capacitor and the signal detected electrically using a tuned SQUID amplifier and Q-spoiler. In this way, the electrical polarization induced by the precessing Cl nuclear quadrupole moments was detected: this is the inverse of the Stark effect in NQR. Two experiments involving NMR have been carried out. In the first, the 30 MHz resonance in ^{119}Sn nuclei is detected with a tuned amplifier and Q-spoiler, and a single pulse resolution of 10^{18} nuclear Bohr magnetons in a bandwidth of 25 kHz has been achieved. For the second, a low frequency NMR system has been developed that uses an untuned input circuit coupled to the SQUID. The resonance in ^{195}Pt nuclei has been observed at 55 kHz in a field of 60 gauss.

36906 Chaos and catastrophe near the plasma frequency in the rf-biased Josephson junction. Kautz, R.L. (4435000); Monaco, R. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1399-1403 (Mar 1989). (CONF-880812--: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

At bias frequencies much higher than the plasma frequency, the zero-voltage state of the rf-biased Josephson junction is known to span a range of dc bias proportional to the zero-order Bessel function of the rf amplitude. This pattern is modified at frequencies near the plasma frequency by the onset of chaotic instabilities and by the presence of cusp catastrophes.

36907 The design of a high field Ohmic heating coil for a superconducting tokamak, based on the US-DPC test coil. Hoenig, M.O. (9510048); Steeves, M.M. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1481-1483 (Mar 1989). (CONF-880812--: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The fabrication of the US-DPC test coil in the US is using industrial processes capable of manufacturing advanced 30 to 40 κA ternary Nb_3Sn cable-in-conduit (CICC) conductors and coils for compact, high field tokamaks. This paper examine the feasibility of 1 to 2 m bore 15 T Ohmic Heating (OH) coils using state of the art

CICC conductors. The proof of concept of this technology should be confirmed in the 1990 US-DPC tests at the Japanese Demonstration Poloidal Coil Test Facility (DPCF). While this technology has yet to be demonstrated, the OH coil design concepts presented in this paper appear to satisfy all known superconducting, magnetic, pulsed loss, structural, hydraulic, thermodynamic, as well as economic requirements of an ohmic heating central solenoid for a compact steady state tokamak.

36908 Test results from recent 1.8-M SSC model dipoles. Wanderer, P. (0936000); Cottingham, J.G.; Dahl, P.; Garber, M.; Ghosh, A.; Goodzeit, C.; Greene, A.; Herrera, J.; Kahn, S.; Kelly, E. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1451-1454 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The authors report results from four 1.8 m-long dipoles built as part of the Superconducting Super Collider (SSC) R and D program. Except for length, these models have the features of the SSC design, which is based on a two-layer cosine theta coil with 4cm aperture. As compared to the 17 m design length SSC dipoles, these 1.8m magnets are a faster and more economical way of testing design changes in field shape, conductor support in the coil straight-section and ends, etc. The four magnets reported here all reach fields in excess of 7.5T with little training and have excellent field shape.

36909 Magnet systems for the international thermonuclear experimental reactor. Henning, C.D. (9513035); Miller, J.R. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1469-1472 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The definition phase for the International Thermonuclear Experimental Reactor (ITER) has been nearly completed, thus beginning a three-year design effort by teams from the European Community (EC), Japan, U.S., and USSR. Preliminary parameters for the superconducting magnet system have been established to guide more detailed design work. Radiation tolerance of the superconductors and insulators has been important because it sets requirements for the neutron-shield dimension and sensitively influences reactor size. Major levels of mechanical stress appear in the structural cases of the inboard legs of the toroidal-field (TF) coils. The winding packs of the TF coils include significant fractions of steel that provide support against in-plane separating loads, but they offer little support against out-of-plane loads unless shear-bonding of the conductors can be maintained. Heat removal from nuclear and ac loads has not limited the fundamental design, but it has nonnegligible economic consequences.

36910 Status of the SSC superconducting magnet program. Peoples, J. (9513034). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1444-1450 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The Superconducting Super Collider (SSC) is proton-proton collider designed to achieve collisions with 20 TeV per beam, which has been proposed for construction by the U.S. Department of Energy. In the SSC, protons are accelerated and stored in two storage rings that are stacked one on top of the other in an underground tunnel. Collisions can occur at six locations where the proton orbits can be made to intersect. In each collider ring the protons are kept in a roughly elliptical orbit by two types of magnets: dipoles, which bend the proton orbit into a closed loop, and quadrupoles, which deflect the protons back toward the central orbit when they diverge from it. Both types of magnets must use high current density superconducting coils to meet the SSC design requirements. In fact, it is these superconducting coils that make such a supercollider feasible. A dipole field of 6.6 T was chosen as a compromise between the need for the highest practical field and the limits of superconducting technology. The energy of 20 TeV is somewhat more than twenty times the energy of the highest energy storage ring in operation, the Tevatron, a single-ring proton-antiproton collider at Fermi National Accelerator Laboratory (Fermilab) that was the first synchrotron to use superconducting dipoles. To illustrate the technological advances that must be made to make the SSC a reality, the authors compare the parameters of the SSC with the Tevatron. Since the dipoles are the most numerous, the most expensive, and, at least traditionally, the most difficult to develop, an R and D program was started in 1984 to develop a dipole meeting all of the systems requirements for the SSC. Some SSC dipole parameters are discussed.

36911 Measurement of internal forces in superconducting accelerator magnets with strain gauge transducers. Goodzeit, C.L. (0936000); Anerella, M.D.; Ganetis, G.L. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1463-1468 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

An improved method has been developed for the measurement of internal forces in superconducting accelerator magnets, in particular the compressive stresses in coils and the end restraint forces on the coils. The transducers have been designed to provide improved sensitivity to purely mechanical strain by using bending mode deflections for sensing the applied loads. Strain gauge resistance measurements are made with a new system that eliminates sources of errors due to spurious resistance changes in interconnecting wiring and solder joints. The design of the transducers and their measurement system is presented along with a discussion of the method of compensation for thermal and magnetic effects, methods of calibration with typical calibration data, and measured effects in actual magnets of the thermal stress changes from cooldown and the Lorentz forces during magnet excitation.

36912 Tests of full scale SSC R and D dipole magnets. Strait, J. (9500721); Brown, B.C.; Hanft, R.; Kuchnir, M.; Lamm, M.; Lundy, R.; Mantsch, P.; Mazur, P.O.; McInturff, A.; Orr, J.R. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1455-1458 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

Four full-scale SSC R and D dipole magnets, incorporating successive mechanical design improvements, have been quench tested. Three of these magnets are heavily instrumented with sensors to measure the mechanical behavior of the magnets and verify the performance of the mechanical improvements and with multiple voltage taps to locate the origin of quenches. The last two magnets of this series reach the SSC design operating field of 6.6 T in two or fewer quenches. Load cells and motion sensors show that in these two magnets the azimuthal clamping stress is higher at zero current and drops more slowly with excitation than in previous long magnets and that the axial motion of the coil upon excitation has been greatly reduced. Quenches are found to originate preferentially in several locations, suggesting other design improvements.

36913 Magnetic field decay in model SSC dipoles. Gilbert, W.S. (9513034); Althaus, R.F.; Barale, P.J.; Benjegerdes, R.W.; Green, M.A.; Green, M.I.; Scanlan, R.M. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1459-1462 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The authors have observed that some of our model SSC dipoles have long time constant decays of the magnetic field harmonics with amplitudes large enough to result in significant beam loss, if they are not corrected. The magnets were run at constant current at the SSC injection field level of 0.3 tesla for one to three hours and changes in the magnetic field were observed. One explanation for the observed field decay is time dependent superconductor magnetization. Another explanation involves flux creep or flux flow. Data are presented on how the decay changes with previous flux history. Similar magnets with different Nb-Ti filament spacings and matrix materials have different long term field decay. A theoretical model using proximity coupling and flux creep for the observed field decay is discussed.

36914 Impact of high temperature superconductors on the possibility of radio-frequency confinement. Dean, S.O. (9523022). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1554-1557 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

Recent discoveries of superconducting materials that operate at high temperatures may have both technical and economic consequences for magnetic confinement fusion. In addition, they could also open up the possibility of plasma confinement by radio-frequency fields. The new, high temperature superconductors may impact the feasibility of rf confinement in two important ways: (1) higher temperature superconductors should have higher critical B fields and consequently may allow higher critical electric fields to be sustained in the cavity, thus allowing the necessary confining pressure to be achieved; and (2) the higher temperature superconductors lower the refrigeration power necessary to maintain the superconducting cavity, thus allowing a favorable energy balance.

36915 Standard-II and extended tests of the Swiss LCT-coil. Zichy, J.A. (5107200); Jakob, B.; Kwasnitza, K.; Sborchia, C.; Vecsey, G.; Lubell, M.S.; Shen, S.S. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1558-1561 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The Swiss contribution to the international Large Coil Task was a D-shaped 2.5 x 3.5 m . m bore, superconducting toroidal field coil of 8 T. The conductor was made from copper stabilized fully transposed NbTi filaments, cabled in three stages and cooled with pressurized supercritical helium. The testing of the six coils was successfully finished last year at Oak Ridge National Laboratory. Results of the single-coil and the full-array Standard-I tests were reported earlier. This paper presents the data of the ac loss measurements taken during the Standard-II tests. The results are compared with predictions made while designing the coil. Next the results of the Extended Condition tests are discussed. Finally the recently analyzed quench data, taken during the whole test period, are presented.

36916 Thermal-hydraulic simulation of helium expulsion from a cable-in-conduit conductor. Luongo, C.A. (9506433); Loyd, R.J.; Chen, F.K.; Peck, S.D. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1589-1595 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

This paper presents simulation results of a quenching cable-in-conduit conductor (CICC) for application in Superconducting Magnetic Energy Storage (SMES). The details of the model and its computational implementation (the code HEDUMP) are discussed. An extensive verification process shows that HEDUMP can accurately model a quenching CICC. Preliminary results of the simulation are given and discussed. In particular, the normal zone propagation is studied. It is shown that CICCs exhibit a thermohydraulic quench back behavior whereby superconducting regions ahead of the normal front are suddenly driven normal by frictional dissipation and/or compression heating of the fluid.

36917 Effects of insulation on potted superconducting coils. Zeller, A.F. (9519721); DeKamp, J.C.; Magsig, C.T.; Nolen, J.A.; McInturff, A.D. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1536-1537 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

Test coils using identical wire but with either Formvar or Polyesterimid insulation were fabricated to determine the effects of insulation on training behavior. It was found that the type of insulation did not affect the training behavior. While considerable attention has been paid to epoxy formulations used for superconducting coils, little study has been devoted to the effects of the wire insulation on training behavior. If the insulation does not bind well with the epoxy, the wires will not be held securely in place, and training will be required to make the coil operate at its design limit. In fact, the coil may never reach its design current, showing considerable degredation. Conversely, if the epoxy-insulation reaction is to soften or weaken the insulation, then shorts and/or training may result. The authors have undertaken a study of the effects of the insulation on potted coils wet wound with Stycast 2850 FT epoxy. The wire was insulated with one of two insulting varnishes: Formvar (a polyvinyl formal resin) or Polyesterimid (a phenolic resin). Formvar is the standard insulation in the United States while Polyesterimid the European standard.

36918 Advanced superconducting MHD magnet design for a retrofit power plant. Marston, P.G. (9510048); Hale, J.R.; Dawson, A.M. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1562-1564 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

A magnet system has been designed for an MHD topping cycle retrofit of a conventional power plant. The channel power output wil be –35 MWe. The 4.5 T peak on-axis field magnet will be constructed of an unusual NbTi superconductor wound into four subunits per dipole half. These will be three 45^0 saddle coils with circular or ellipsoidal end turns and a single planar coil with a modified racetrack shape that will serve principally as a field shaping coil. This planar coil also enables a substantial reduction in the ratio of peak to central field strength. Among the unique features of this design will be the use of flexible bands in tension as the primary element of the transverse force containment structure. The conductor will be of the cable-in-conduit type with a low copper-to-superconductor ratio cable and a thick-walled aluminum conduit sheath. The sheath will support the axial loads on the saddles and will also provide thermal mass for protection against overheating in the event of an energy dump. The analysis and design of this magnet system and its projected advantages in both performance and economics are discussed.

36919 Manufacture and testing of 465 km superconducting cable for the HERA dipole magnets. Maix, R.K. (Asea Brown Boveri Ltd., Dept. ISM, CH-8050 Zurich (CH)); Salathe, D.; Wipf, S.L.; Garber, M. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1656-1659 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The production of 465 km of keystoned superconducting cable for the HERA dipoles has been completed in July 1988. The specifications for DESY set challenging requirements, such as a minimum critical current of 8000 A at 5.5 T and 4.6 K and the goal to keep the cable's I_c within ± 2%. Experience concerning the strand and cable manufacturing are presented together with some of the mechanical and electrical data. A comparison of the critical currents of the cables with the sum of the critical currents of the 24 individual strands before cabling shows that with the usual definition the cables have practically no degradation. Finally, it is shown how different cable compactions and an additional calibration run through the cabling machine influence the critical current.

36920 Time variations of fields in superconducting magnets and their effects on accelerators. Herrup, D.A. (9500721); Syphers, M.J.; Johnson, D.E.; Johnson, R.P.; Tollestrup, A.V.; Hanft, R.W.; Brown, B.C.; Lamm, M.J.; Kuchnir, M.; McInturff, A.D. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1643-1646 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

A report on the time dependence of magnetic fields in the superconducting magnets of the Fermilab Tevatron has been published. A field variation of order 1 Gauss at the aperture radius is observed. Studies on both full sized Tevatron dipoles and prototype magnets have been used to elucidate these effects. Explanations based on eddy currents in the coil matrix or on flux creep in the superconducting filaments are explored with these tests. Measurement results and techniques for controlling the effect based on new laboratory tests and the latest accelerator operation are presented.

36921 Studies of time dependence of fields in Tevatron superconducting dipole magnets. Hanft, R.W. (9500721); Brown, B.C.; Herrup, D.A.; Lamm, M.J.; McInturff, A.D.; Syphers, M.J. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1647-1651 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The time variation in the magnetic field of a model Tevatron dipole magnet at constant excitation current has been studied. Variations in symmetry allowed harmonic components over long time ranges show a log t behavior indicative of flux creep. Both short time range and long time range behavior depend in a detailed way on the excitation history. Similar effects are seen in the remnant

fields present in full-scale Tevatron dipoles following current ramping. Both magnitudes and time dependences are observed to depend on details of the ramps, such as ramp rate, flattop duration, and number of ramps. In a few magnets variations are also seen in symmetry unallowed harmonics.

36922 Superconducting super collider second generation dipole magnet cryostat design. Niemann, R.C. (9500721); Bossert, R.C.; Carson, J.A.; Engler, N.H.; Gonczy, J.D.; Larson, E.T.; Nicol, T.H.; Ohmori, T. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1615-1619 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The Superconducting Super Collider, a planned colliding beam particle physics research facility, requires ~10,000 superconducting devices for the control of high energy particle beams. The ~7,500 collider ring superconducting dipole magnets require cryostats that are functional, cryogenically efficient, mass producible and cost effective. A second generation cryostat design has been developed utilizing the experiences gained during the construction, installation and operation of several full length first generation dipole magnet models. The nature of the cryostat improvements is presented. Considered are the connections between the magnet cold mass and its supports, cryogenic supports, cold mass axial anchor, thermal shields, insulation, vacuum vessel and interconnections. The details of the improvements are enumerated and the abstracted results of available component and system evaluations are presented.

36923 An alternate method for designing dipole magnet ends. Pope, W.L. (9513034); Green, M.A.; Peters, C.; Caspi, S.; Taylor, C.E. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1611-1614 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

Small bore superconducting dipole magnets, such as those for the SSC, often have problems in the ends. These problems can often be alleviated by spreading out the end windings so that the conductor sees less deformation. This paper presents a new procedure for designing dipole magnet ends which can be applied to magnets with either cylindrical or conical bulged ends to have integrated field multipoles which meet the constraints imposed by the SSC lattice. The method described here permits one to couple existing multiparameter optimization routines (i.e., MINUIT with suitable independent parameter constraints) with a computer code DIPEND, which describes the multiples, so that one can meet any reasonable objective (i.e., minimizing integrated sextupole and decapole). This paper describes how the computer method was used to analyze the bulged conical ends for an SSC dipole.

36924 Optimization of multiwire coil ends having 45 degree bends. Morgan, G.H. (0936000). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1640-1642 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

Multiwire is the name of a proprietary process for affixing small diameter wires to a flat substrate using digitally controlled machinery. It is currently being used to wind trim coils for the SSC dipoles on a flexible substrate which is wrapped around the beam tube. It is proposed for making multipole coils for the Corrector, a regular arc magnet in each half-cell of the Relativistic Heavy Ion Collider (RHIC). The current Multiwire process does not permit a change in direction of the wire other than 45 degree. The present paper answers the question of whether the 45 degree bends in the flattened coil can be located along straight lines in such a way as to eliminate or reduce higher harmonics in the ends. The more general question of bends located along curves is not addressed.

36925 SSC detector solenoid. Fast, R.W. (9500721); Grimson, J.H.; Kephart, R.D.; Krebs, H.J.; Stone, M.E.; Theriot, E.D.; Wands, R.H. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1620-1623 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

A detector utilizing a superconducting solenoid is being discussed for the Superconducting Super Collider (SSC). A useful field volume of 8 m diameter x 16 m length at 1.5-2 T (~1 GJ at 2T) is required. It has been decided that all of the particle physics calorimetry will be inside the bore of the solenoid and that there is no need for the coil and cryostat to be "thin" in radiation lengths. An iron yoke will reduce the excitation required and will provide muon identification and a redundant momentum measurement of the muons. The authors have developed a conceptual design to meet these requirements. The magnet will use a copper-stabilized Nb-Ti conductor sized for a cryostable pool boiling heat flux ~0.025 W/cm^2. A thermosiphon from a storage vessel above the cryostat will be used to prevent bubble stagnation in the liquid helium bath. The operating current, current density, coil subdivision and dump resistor have been chosen to guarantee that the coil will be undamaged should a quench occur. The axial electromagnetic force will be reacted by metallic support links; the stainless steel coil case will support the radial force. The 5000 metric tons of calorimetry will be supported from the iron yoke through a trussed cylindrical shell structure separate from the cryostat. The coil and case, radiation shield and stainless vacuum vessel would be fabricated and cryogenically tested as two 8-m sections. These would be lowered into the underground experimental hall and installed into the iron flux return yoke to provide the required 16-m length.

36926 General formulas for the adiabatic propagation velocity of the normal zone. Devred, A. (9521157). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1698-1705 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The influence on the propagation velocity of the normal zone of four phenomena was investigated: The temperature dependence of the specific heat and the thermal conductivity, the current-sharing zone, the electromagnetic diffusion of current through a possible super-stabilizer, and the thermal diffusion through a possible insulator. At the beginning, these influences were studied independently of each other. In all cases, after creating a model of the particular phenomenon, the equations of thermal and electromagnetic behavior were solved analytically and the expressions for the propagation velocity obtained. These expressions were then put into nondimensional forms, which have allowed us to define four correction factors taking into account the studied influences, depending only on one or two nondimensional parameters. Subsequent studies were made to investigate how to combine these correction factors in order to obtain general formulas for the velocity, taking into account a part or all of these influences. A review is presented here of these formulas, which are of interest for the superconducting windings, where the heat transfer to helium can be neglected on the time scale of the quench process.

36927 Influence of dump voltage and allowable temperature rise on stabilizer requirements in superconducting coils. Schwenterly, S.W. (4832000). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1717-1720 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

A superconducting winding must have enough stabilizer to satisfy two sets of criteria. During normal operation, the amount of stabilizer must be large enough either to make the coil unconditionally stable or give a certain desired stability margin. Once a dump occurs, the amount of stabilizer must be large enough to carry the current without generating excessive dump voltages or allowing the winding to exceed a certain maximum temperature (and maximum pressure, in the case of force-cooled coils). The voltage criterion often dominates for very large coil systems, but it is frequently ignored in initial design studies. This paper gives some simple relations between the dump voltage and the stored energy, temperature rise, and coil geometry that are useful in scoping the required amount of stabilizer. Comparison with some recently proposed fusion magnet system designs indicates that excessive dump voltages could result in some cases. High-temperature superconductors may require more stabilizer than the conventional alloys. Calculations with simple model coil systems indicate how trade-offs between various coil parameters affect the dump voltage.

36928 A comparison of the conductor requirements for energy storage devices made with ideal coil geometries. Hassenzahl, W. (9513034). *IEEE (Institute of Electrical and Electronics*

Engineers) Transactions on Magnetics (USA), 25(2): 1799-1802 (Mar 1989). (CONF-880812--: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

Superconducting Magnetic Energy Storage (SMES) plants have been proposed in both solenoidal and toroidal geometries. The former is efficient in terms of the quantity of superconductor required per unit of stored energy. For applications where a fringe field could be a problem, the toroidal geometry, which requires at least a factor of two or more material, has been proposed. In addition to the solenoid and toroid, other geometries are possible, such as linear multipoles and spherical coils. These geometries have been considered for use in applications other than energy storage. In this report, the effectiveness (quantity of superconductor/stored energy) is calculated for various coil geometries.

36929 Large coil task instrumentation and diagnostics. Lue, J.W. (4832000); Ellis, J.F.; Fietz, W.A.; Lubell, M.S.; Luton, J.N.; Schwenterly, S.W.; Wilson, C.T.; Wintenberg, R.E. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1734-1737 (Mar 1989). (CONF-880812--: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The goal of the Large Coil Task (LCT) was to develop large toroidal superconducting magnets for fusion reactors. Each of the six coils built for this task was heavily instrumented with some 200 to 400 sensors and diagnostic voltage taps to test its performance and characteristics. In addition, more than a thousand sensors were installed in the facility and test-stand components to ensure safe and controlled operation. Through the three-year test period, some sensors worked consistently, some failed prematurely, some constantly gave useful information, some were rarely used, and others were vital in a particular test mode. This paper reviews the various type of thermometers, pressure transducers, flowmeters, strain gages, displacement transducers, acoustic emission sensors, field probes, and other diagnostic instrumentation used in LCT. The usefulness of the sensors, the difficulties with some of them, and the reliability of different groups of sensors in this task are described.

36930 Structural characteristics of proposed ITER TF coil conductor. Gibson, C.R. (9500489); Miller, J.R. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1725-1729 (Mar 1989). (CONF-880812--: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

This paper analyzes the effect of transverse loading on a cable-in-conduit conductor which has been proposed for the toroidal field coils of the International Thermonuclear Experimental Reactor. The primary components of this conductor are a loose cable of superconducting wires, a thin-wall tube for helium containment, and a U-shaped structural channel. A method is given where the geometry of this conductor can be optimized for a given set of operating conditions. It is shown, using finite-element modeling, that the structural channel is effective in supporting loads due to transverse forces and internal pressure. In addition, it is shown that the superconducting cable is effectively shielded from external transverse loads that might otherwise degrade its current carrying capacity.

36931 The effect of transverse stress on the critical current of Nb_3Sn cable-in-conduit superconductors. Summers, L.T. (9513035); Miller, J.R. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1835-1838 (Mar 1989). (CONF-880812--: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The authors have investigated the effects of transverse stress on the critical current of Nb_3Sn Cable-In-Conduit Conductors (CICC). The sensitivity of the critical current (I_c) to applied stress at 12 T has been determined for CICC's with helium void fractions (f_{He}) in the range of 0.25 - 0.4. I_c has been found to be a function transverse stress with good correlation to single wire data up to stress levels of 50 MPa. At higher stress levels the CICC's show significantly higher degradation with transverse stress. No clear correlation has been found between the stress sensitivity of I_c and f_{He}. The results fall into a broad band suggesting that geometric factors, such as wire position within the cable bundle, exert a strong influence on the I_c vs. stress dependence.

36932 Flux creep in a Tevatron cable. Kuchnir, M. (9500721); Tollestrup, A.V. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1839-1842 (Mar 1989). (CONF-880812--: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The authors have measured the slow magnetization decay of a short sample (2.3 cm) of Tevatron cable in fields up to 0.3 T. The special susceptometer in development for these measurements is based on a commercial SQUID and is described in detail. The observed decay is logarithmic in time as expected from flux creep in the NbTi filaments. A strong correlation was found between the decay and the magnetization status of the sample. It is too early yet to present a quantitative correlation between what they observed and the decay observed in the sextupole component of Tevatron dipoles. The detailed understanding of this phenomena may be instrumental in guiding the search for efficient superconducting synchrotron operational procedures.

36933 Training in test samples of superconducting cables for accelerator magnets. Ghosh, A.K. (0936000); Garber, M.; Robins, K.E.; Sampson, W.B. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1831-1834 (Mar 1989). (CONF-880812--: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

In the critical current measurement of some high current NbTi cables, the samples have to be trained by repeated quenching in order to obtain a usable voltage-current curve for I_c determination. This training behavior is most pronounced when the applied field is perpendicular to the wide face of the conductor and is strongly dependent on the copper-to-superconductor ratio and the clamping pressure. Data are given for SSC prototype cables as well as for HERA production conductors. Although a quantitative understanding of the experimental data is still lacking, some speculations regarding stability are presented.

36934 CEBAF superconducting spectrometer design. Brindza, P. (9525040); Alcorn, J.; Carlini, R.; Harwood, L.; LeRose, J.; Mecking, B.; Mougey, J.; O'Meara, J. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1897-1901 (Mar 1989). (CONF-880812--: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The CEBAF Experimental Nuclear Physics Program is based upon three independent facilities each with unique capabilities. Hall A consists of a pair of High Resolution Spectrometers (HRS), Hall B features a Large Acceptance Spectrometer (LAS) and Hall C will have a high acceptance, high energy electron spectrometer and matching special purpose hadron spectrometer. The performance and operational of these devices can be met effectively through the use of superconducting devices. The Hall A and Hall C spectrometers require high quality, large volume dipole magnets, that although are not beyond the range of conventional magnets, operating considerations favor a superconducting device. The spectrometers require high gradient, large aperture quadrupoles that could not be produced without the use of a superconducting cos 2θ device. The LAS requires a large volume toroidal magnetic field for momentum analysis. The six coils of the Torus must be thin to allow the acceptance to reach 80%. This device could be built using a conventional coil but it would not meet the acceptance specification and the operating cost would be prohibitive. The physics requirements and the rational basis for the design selection will be presented. The analysis that supports the cost effectiveness of the selected design will be presented. The cryogenic system will be covered as well as the integration of the Experimental Hall Cryogenic system and main CEBAF Central Helium Refrigerator.

36935 Considerations against a force compensated coil. Hassenzahl, W. (9513034). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1854-1857 (Mar 1989). (CONF-880812--: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The cost of structural components in a large superconducting coil may well exceed the coil and cryostat cost. As a result, the idea of constructing a system composed of two different coil types assembled in such a way that the forces balance and reduce the total structural requirement is oft proposed. A suitable geometry has never been found for the fundamental reason that there can be no

force compensated solution. In this paper, the general problem is presented and an analysis of the energy stored and stresses produced in the structure are described in a fundamental way. Finally, the relation between structural mass M and stored energy E that is valid for all magnetic systems is developed.

36936 The effect of self field on the critical current determination of multifilamentary superconductors. Garber, M. (0936000); Ghosh, A.K.; Sampson, W.B. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1940-1944 (Mar 1989). (CONF-880812--: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

In determining the short sample critical current of conductors of large cross section or high current density the self field produced by the transport current must be taken account in order to obtain a true value for the critical current. A simple model calculation for determining this effect is described. Measurements on wires, cables, and monoliths show the validity and self consistency of the procedures.

36937 A superconducting cos 2θ quadrupole design for the CEBAF high resolution spectrometer. Tuzel, W. (9525040); Alcorn, J.; Brindza, P.; Gavalya, A.; Mougey, J.; Nanda, S. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1914-1917 (Mar 1989). (CONF-880812--: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The pair of High Resolution Spectrometers (HRS^2) at CEBAF require large aperture, high gradient quadrupoles. A superconducting cos 2θ is under consideration to meet these requirements. The quadrupole has a coil diameter of 1m and a peak gradient of 5 T/m with an effective field length of 1.8 m. The stored energy of this quad is 3.0 MJ. The details of the design of the coil, shrink fit support collar and cryotstat are presented. The analysis of the superconductor, quench behavior and coil protection system is covered.

36938 A conductor, with uncoupled 2.5 μm. diameter filaments, designed for the outer cable of SSC dipole magnets. Gregory, E. (9519456); Kreilick, T.S.; Wong, J.; Collings, E.W.; Marken, K.R.; Scanlan, R.M.; Taylor, C.E. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1926-1929 (Mar 1989). (CONF-880812--: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

A conductor, with a stabilizer to superconductor ratio of 1.8/1 and containing 22,900, 2.5 μm. diameter, filaments at a wire diameter of 0.65 mm., has been produced. The fabrication procedures used to make this material from a full production size billet, 305 mm. in diameter, are described. Metallographic, electrical and magnetization data are presented and these illustrate that the filaments are completely uncoupled at the size used in the outer SSC cable. This work indicates the feasibility of the commercial manufacture of such a 2.5 μm. diameter filamentry material. Preliminary tests show relatively low J_c's and n values. It is likely that materials with smaller spacings than those used in this work, will be required before the J_c's specified for the SSC can be obtained reproducibly.

36939 A superconducting iron-dominated quadrupole for CEBAF. Harwood, L.H. (9525040); Lassiter, S.; Tuzel, W. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1910-1913 (Mar 1989). (CONF-880812--: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The present design for the high-resolution spectrometers at CEBAF requires a front quadrupole (QO) that has a gradient x length of 6.8 T with a good field aperture ($1x10^{-8}$ uniformity in gradient) of 16 cm radius. A room temperature design was found too power hungry and interfered with the beam. Engineering and construction of a small cos 2θ magnet was considered to be quite expensive. A Panofsky design was not considered due to the extreme sensitivity of the field quality to errors in conductor placement. A conformal mapping of a window-frame dipole into quadrupole geometry worked well at NSCL. A conceptual design has been developed with the following characteristics; physical length (total)= 1.2 m; iron length= 1.1 m; iron outer dimensions= 54 cm x 80 cm; peak gradient= 6.2 T/m; pole radius= 20 cm; Good field radius= 16 cm; coil peak field= 1.5 T; conductor= 1 mm diameter; Cu/NbTi= 7:1; current= 400 A; turns= 250/quadrant; stored energy= 50 kJ.

36940 Current capacity degradation in superconducting cable strands. Goodrich, L.F. (4435000); Bray, S.L. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1949-1952 (Mar 1989). (CONF-880812--: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The electromagnetic properties of NbTi strands extracted from Rutherford cables were studied to clarify the effect of mechanical deformation, caused by the cabling process, on the current capacity of the strands. Three different cables were studied, all of which are prototypes for the Superconducting Super Collider's dipole magnets. The extracted cable strands were instrumented to allow measurement of the voltage across several key regions of mechanical deformation as a function of current and the orientation of the applied magnetic field. The resulting data are presented in terms of the strand's voltage profile as well as its critical current in order to more thoroughly characterize the conductor's electromagnetic properties. The cable strands show very localized reductions in current capacity that are well correlated with the regions of high mechanical deformation. For example, at a particular field orientation, the voltage across a portion of the strand that is only 3% of the total strand length contributes 92% of the total strand voltage. Two applied magnetic field orientations, parallel and perpendicular to the cable's width, have pronounced effects on the electrical properties of the strand. Both of these magnetic field orientations will arise in applications.

36941 Intermediate scale industrially processed Nb_3Sn(Ti) by powder metallurgy. Pourrahimi, S. (9502899); Tnieme, C.L.H.; Foner, S. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1964-1967 (Mar 1989). (CONF-880812--: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The authors' powder metallurgy processing of Nb_3Sn(Ti) wire was scaled up to 75 mm diameter billets each containing 4 kg of pressed powder composite. Prealloyed Nb-1.5wt%Ti powder was used for optimum high field properties. An initial hot extrusion step provided complete consolidation and excellent integrity of the powder composite. Using the extruded bars, various single and multiple tin core billets were prepared and hydrostatically extruded to 12 mm diameter bars. Long lengths of internal tin core wire were drawn without any breakage to less than 1 mm diameter. In order to evaluate the performance of long length wires, small magnets were fabricated from these wires and tested in background fields of water-cooled Bitter magnets up to 20 tesla. $J_c=10^4 A/cm^2$ was measured at 20T (equal to the short sample performance) and n-values at high fields were comparable to, or better than those of conventional Nb_3Sn(Ti) wires. The processing, performance and microstructure is discussed. This intermediate scale process used conventional metal forming techniques that can be scaled to larger P/M industrial processing.

36942 A superconducting toroidal magnet for the CEBAF large acceptance spectrometer. O'Meara, J. (9525040); Alcorn, J.; Brindza, P.; Chew, M.S.; Doolittle, G.; Fowler, M.; Mecking, B.; Riggs, C.; Tilles, D.; Tuzel, W. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1902-1905 (Mar 1989). (CONF-880812--: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The CEBAF Physics Program requires a Large Acceptance Spectrometer covering nearly all of the 4π solid angle for studying complex electronuclear interactions. This device relies on a six coil toroidal magnetic field to provide momentum analysis. The desire to maximize solid angle coverage led to a thin superconducting toroid design. The main device has the following parameters: an outside diameter of 4.6 m, an active length of 5 m, a peak field in the toroidal volume of 1.2 T, and a stored energy of 18 MJ. An intrinsically stable design was selected to minimize the overall space requirements of the toroid. The individual coils of the toroid are approximately kidney shaped, the negative curvature provides a field free region for targets coming from the requirement to have good particle focusing properties. The overall design is presented along with stress analysis, conductor and quench analysis and cryogenic cool down analysis. The six coils are powered in series and are protected by an external resistor. The analysis and operational characteristics of the protection system are presented.

36943 A superconducting dipole concept for the CEBAF high resolution spectrometers. Alcorn, J. (9525040); Brindza, P.; Fowler, M.; Harwood, L.; Hunter, T.; Tuzel, W. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 1906-1909 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

CEBAF's Hall A requires a pair of High Resolution Spectrometers (HRS) for performance of electron/hadron coincidence experiments at up to 4 GeV/c. Momentum analysis for each arm is provided by a 45^0 vertical bending dipole having a useful field volume 6.0 m long x 30-40 cm wide (pole gap) x 80 cm high. A resistive 30 cm gap dipole has been selected for the reference 4 GeV/c HRS, utilizing a qQQDQQ magnet configuration. However, recent studies aimed at equipment cost reduction indicate that a 40 cm gap superconducting dipole based upon less stringent field uniformity requirements may be attractive, either with the reference HRS or with a revised design, employing fewer magnet elements. The concept described herein is an H frame superconducting magnet, with contoured poles and resistive interpole field shaping coils, to achieve a field quality of 1 gauss/cm across the aperture at all useful excitation levels. This approach yields minimal pole width and requires only conventional fabrication tolerances.

36944 Reaction kinetics of phase formation in Nb-Al powder metallurgy processed wire. Coffey, K.R. (9510048); Barmak, K.; Rudman, D.A.; Thieme, C.L.H.; Foner, S. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 2093-2096 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The sequence of phases formed in the low temperature reaction of niobium and aluminum to form the A15 superconductor, Nb_3Al, was studied in high areal reduction powder metallurgy processed wire samples. The reaction path observed was the same as that reported previously for multilayer Nb/Al thin films. The reaction proceeds without the formation of the sigma phase, Nb_2Al, resulting in a metastable A15 of higher Al concentration. The extent of this metastable extension is estimated to be 22-24 atomic percent Al based upon the resistive T_c of 17.0 K observed. The reaction kinetics of the wire samples were examined by scanning heat flux calorimetry, and the activation energy of A15 formation was found to be 3.1 eV. The formation of $NbAl_3$ and dissolution of Al into the Nb lattice were both observed as precursor reactions with much lower activation energies.

36945 Low contact-resistivity junctions to ceramic superconductors. Maley, M.P. (9512470); Willis, J.O.; Katz, J.D.; Castro, R.G.; Aikin, R.M. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 2053-2055 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The authors report on the development of a plasma-arc spray process for the application of low resistivity silver contact junctions onto $YBa_2Cu_3O_7$ sintered ceramic materials. The contact resistances decrease montonically with decreasing temperature and are typically $\sim 10^{-8}\Omega\text{-cm}^2$ at 75 K. I-V characteristics are linear up to a critical current density that agrees with that of the underlying superconducting material. Advantages over other contact methods include: ease of application, absence of any post-processing treatment, and applicability to large areas and arbitrary shapes.

36946 Normal state resistance and low temperature magnetoresistance of superconducting cables for accelerator magnets. Sampson, W.B. (0936000); Garber, M.; Ghosh, A.K. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 2097-2100 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The normal state resistivity of the superconducting NbTi cable used in accelerator magnets is usually specified by the resistance per unit length at room temperature (295 K) and the residual resistance ratio (RRR). Using these resistance parameters, the amount of copper in the multifilamentary wire can be calculated. This method is consistent with the traditional etch and weigh technique, and as such is a alternative and convenient way of specifying the copper to superconductor ratio. In principle the magnetoresistance can be calculated from the RRR and the Kohler Plot, for copper. In practice however, measurements of magnetoresistance for a wide variety of SSC inner cable show considerable disagreement with calculation. In this paper the magnetoresistance data on cables with RRR ranging from 50 to 175 are analyzed taking into account the conductor geometry and the effect of the small interfilamentary spacing on the resistivity of copper.

36947 Grain size control in powder processed $Y_1Ba_2Cu_3O_x$. No, K. (9517861); Verhoeven, J.D.; McCallum, R.W.; Gibson, E.D. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 2184-2187 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

It is demonstrated that small grained $YBa_2Cu_3O_x$ (123) material can be made from powders of Y_2O_3, $BaCO_3$ and CuO by avoiding liquid phase formation in the high temperature treatments. Techniques for avoiding liquid phase formation are demonstrated and transport J_c measurements versus grain size are presented.

36948 Ductility enhancement in unreacted internal-Sn Nb_3Sn through low-temperature anneals. Strum, M.J. (9513035); Summers, L.T.; Miller, J.R. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 2208-2211 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

A lack of tensile ductility in as-drawn superconducting wires at room temperature can lead to damage during magnet fabrication steps such as cabling and coil winding. The tensile elongation of 0.42 mm internal-Sn Nb_3Sn conductor in the as-drawn unreacted condition is limited to less than 3 percent at room temperature. The tensile elongation is substantially enhanced through low-temperature annealing treatments at 200^0C, increasing to as high as 10% after 24 hrs. at 200^0C. This effect is attributed to increased work hardening capacity from softening which reduces yield strengths up to 50% while maintaining 90% of the tensile strength. Fracture surfaces of annealed wires reveal increased adhesion between the Sn cores and the surrounding Cu as well as an increase in ductile void coalescence as the failure mechanism within the Cu. Preliminary results on the pre-reaction strain sensitivity of reacted wire critical currents confirm the increased strain tolerance in annealed wires.

36949 Superconductivity, critical current density, and magnetic properties of Fe-substituted $Y_1Ba_2(Cu_{1-x}Fe_x)_3O_z$ materials. Sekula, S.T. (4832000); Brynestad, J.; Christen, D.K.; Thompson, J.R.; Kim, Y.C. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 2266-2269 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The superconductive properties of a series of Fe-substituted $Y_1Ba_2(Cu_{1-x}Fe_x)_3O_z$ materials, with x = 0 to 10 at. % Fe, have been studied. It was found that the T_c decreased linearly with Fe content x at the rate of 6.7 K/at. %. The intragranular critical current density J_c decreased exponentially both with (1) reduced temperature T/T_c and (2) Fe concentration. Since the addition of Fe strongly drives the structure toward tetragonality, it is concluded that neither copper-oxygen chains nor macroscopic twinning are essential for high temperature superconductivity.

36950 Superconducting properties of magnetron sputtered high T_c thin films containing oxide compounds of yttrium, bismuth, or thallium. Kang, J.H. (0448000); Kampwirth, R.T., Gray, K.E. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 2226-2229 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The authors have used multiple source magnetron sputtering to prepare thin films of Y-Ba-Cu-O, Bi-Ca-Sr-Cu-O, and Tl-Ca-Ba-Cu-O on (100) $SrTiO_3$, (100) MgO, and ZrO_2-9%Y_2O_3 substrates. Y-Ba-Cu-O films grow best on $SrTiO_3$ with mostly an a-axis orientation. Stoichiometry, particularly the Ba/Ca ratio must be within 2% of the correct value to obtain narrow ΔT_c transitions. Conversely the 80K phase of Bi-Ca-Sr-Cu-O films grows best on MgO substrates and has a predominant c-axis orientation. The requirements on composition are less stringent, however, the annealing temperature must be held within a narrow around 865^0C to obtain the best films.

The best films of Tl-Ca-Ba-Cu-O compounds are grown on (100) oriented and polycrystalline ZrO_2 substrates. The highest transition temperature, T_{c0}, where the resistance goes zero is about 114K in the $Tl_2Ba_2Ca_2Cu_3O_x$ phase and 100-105K in $Tl_2Ba_2Ca_1Cu_2O_x$ and $Tl_1Ba_2Ca_2Cu_3O_x$ phase samples. The upper critical field measurements show high anisotropies in the critical field slopes ($\geq$70 for Tl-Ba-Ca-Cu-O compounds and $\approx$15 for Bi-Sr-Ca-Cu-O compounds), as might be expected from highly oriented materials. The authors compare the preparation conditions and superconducting properties, including T_c, ΔT_c, dB_{c2}/dT (parallel and perpendicular to film surface), of all three compounds.

36951 The critical density throughout the superconducting phase of multifilamentary Nb_3Sn wire for forced flow fusion applications measured using the Bean-Campbell AC magnetization technique. Hampshire, D.P. (9524637); Larbalestier, D.C. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 2382-2385 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

Ac magnetization measurements for transverse orientation have been completed on a multifilamentary Nb_3Sn composite wire which is a candidate for fusion applications. Using these data, the critical current density (J_c) has been determined using the Bean-Campbell analysis in the ranges $B < 10$ tesla and $4.2\ K < T < 11\ K$. Technical operating parameters required during forced flow conditions are explicitly determined.

36952 Anisotropies in the magnetic penetration depth and critical current density of $R_1Ba_2Cu_3O_{7-x}$ (R = Y or Ho), measured on magnetically-aligned powder composites. Christen, D.K. (4832000); Sekula, S.T.; Thompson, J.R.; Brynestad, J.; Sales, B.C.; Boatner, L.A.; Budai, J.D.; Kim, Y.C. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 2325-2327 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

Dispersed, uniaxially-aligned powder composites of $R_1Ba_2Cu_3O_{7-x}$ (R = Y or Ho) were formed by suspending the powder in a liquid organic matrix that was then solidified ina magnetic field. From the observed particle dimensions and magnetic susceptibility measurements for fields applied either parallel or perpendicular to the Cu-O planes, the authors have inferred anisotropies in the superconducting magnetic penetration depth λ. From the magnetization hysteresis in the mixed state, they have derived relative anisotropies in the critical current densities J_c. The observed anisotropies are qualitatively similar for both rare-earth-based materials, but show some quantitative distinctions.

36953 Bi-Ca-Sr-Cu-O superconductors. Green, S.M. (9525167); Rudee, M.L.; Mei, Y.; Luo, H.L.; Ramesh, R.; Thomas, G. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 2360-2363 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The connectivity problem in Bi-Ca-Sr-Cu-O superconductors is addressed in this paper. Bulk samples always exhibit a step in the resistivity plot, consequent to which zero resistance is obtained around 75K, although the onset is above 110K. Magnetic measurements indicate the presence of almost equal fractions of two superconducting phases with transition temperatures of 110K and about 80K. The microstructure of these samples has been examined using several transmission electron microscopy techniques. The superconducting phases exhibit a polytypoid type structure with the general formula of $Bi_2Sr_2\ Ca_{n-1}Cu_nO_y$, where n takes on values of 1,2,3 and in some infrequent cases 4. The c-parameter of T_c increase with n. In almost all the superconducting grains, the lower T_c(n=1 or 2) polytypoid is observed at the grain boundaries. Thus, the 110K polytypoid in each grain is not connected to similar regions in other grains. The lower T_c polytypoid is observed at the grain boundaries due to a reduction of Ca and/or Cu. It is suggested that the controlled addition of PbO enables the formation of a Pb-rich liquid phase which makes the composition near the grain boundaries uniform. Consequently, the step in the resistivity plot disappears.

36954 Rf properties of high-T_c superconductors. Bohn, C.L. (0448000); Delayen, J.R.; DosSantos, D.I.; Lanagan, M.T.; Shepard, K.W. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 2406-2409 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

The authors have investigated the rf properties of high-T_c superconductors over a wide range of temperature, frequency, and rf field amplitude. They have tested both bulk polycrystalline samples and thick films on silver substrates. At 150 MHz and 4.2 K, the authors have measured a surface resistance of 18 $\mu\Omega$ at low rf field and 3.6 mΩ at an rf field of 270 gauss. All samples showed a strong dependence of the surface resistance on rf field; however, no breakdown of the superconducting state has been observed up to the highest field achieved (320 gauss).

36955 In situ growth of superconducting YBaCuO using reactive electron-beam coevaporation. Missert, N. (9506815); Hammond, R.; Mooij, J.E.; Matijasevic, V.; Rosenthal, P.; Geballe, T.H.; Laderman, S.S.; Lu, C.; Garwin; Barton, R. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 2418-2421 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

Conditions required for in situ growth of YBaCuO thin films by reactive electron-beam evaporation have been explored. Three sources of activated oxygen (atomic oxygen from microwave discharge, a plasma generated by electron beams and an ion beam) were compared. The best results so far were obtained with atomic oxygen. Epitaxial films with high critical currents were grown on $SrTiO_3$ <100> and <110>, Al_2O_3 <1102> and MgO <100> at 600^0C. Evaporation rates were controlled with a rate monitor using atomic absorption.

36956 A simple method for preparing superconducting high Tc thin films. Romano, P. (9900969); Nigro, A.; Vaglio, R.; Signorelli, E.; Gray, K.E. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(2): 2481-2483 (Mar 1989). (CONF-880812–: Applied superconductivity conference, San Francisco, CA, USA, 21-25 Aug 1988).

High quality superconducting thin films of the high Tc compound $YBa_2Cu_3O_7$ have been prepared on sapphire using a new, simple method that combines d.c. magnetron sputtering from a single target and evaporation from a heated source. The method should be especially suitable for depositing thin films on complex surfaces. $YBa_2Cu_3O_{7-\delta}$ films with Tc = 92K (onset) were prepared using an YCu_3 target and evaporating barium by a specially designed, feedback controlled, molybdenum heater using both pure barium or a barium-aluminum alloy. The films were characterized by X-rays, Electron Dispersion Spectroscopy and other techniques.

36957 (AD-A–201358/9/XAB) **Optical pumping of vibrational overtones in KI:CN-infrared lasers.** Gosnell, T.R.; Sievers, A.J.; Pollock, C.R. Cornell Univ., Ithaca, NY (USA). Lab. of Atomic and Solid State Physics. Aug 1988. 4p. Available from NTIS, PC A02/MF A01.

Pub. in Optics Letters, Vol. 13, 631-633(Aug 1988).

By using open-resonator configurations, continuous-wave laser oscillation at 4.9 micro m was obtained on the 2=1 vibrational transition of CN– impurities embedded in KI. Population inversion in this device is produced by direct optical pumping of the first-overtone transition of CN– at 2.42 micro m with a tunable (F_2^+) A color-center laser. By using a closed resonator, simultaneous pulsed-laser output was observed from the 3=2 and 2=1 transitions of CN- following long-pulse pumping of the second-overtone transition with the recently developed high-power NaC1:F2+:O2- color-center laser.

36958 (AD-A–204800/7/XAB) **Laser action from syn-(methyl,methyl) bimane.** Pavlopoulos, T.G.; Boyer, J.H.; Politzer, I.R.; Lau, C.M. Naval Ocean Systems Center, San Diego, CA (USA). 1 Dec 1986. 4p. Available from NTIS, PC A02/MF A01.

Pub. in Jnl. of Applied Physics, Vol. 60, No. 11, 4028-4030(1 Dec 1986).

At the present, the Coumarin laser dyes are the ones most widely used for the spectral region stretching from 440 to 550 nm. However, the Coumarin dyes have rather poor photochemical stability. While searching for more stable and efficient laser dyes, the authors 3,4,6,7-tetramethyl-1, 5-diazabicyclo(3.3.0)octa-3, 6-diene-2, 8-dion (SYN-(CH_3,Ch_3)B for short). This new heterocyclic molecule was first reported by Kosower, Pazhenchevsky, and Hershkowitz in 1978. Their work included the observation of strong and striking fluorescence properties, as well as good photochemical stability, for these compounds. It should be emphasized that strong fluorescence (high quantum fluorescence yield) of organic compounds which are not benzene derivatives is rare. The quantum fluorescence yield of the syn-(R2,R1)B ranges from 0.7 to 0.9. The isomer anti-(R2,R1)B is only weakly fluorescent. There are two specific spectroscopic parameters of laser dyes that critically determine the laser action efficiency of flashlamp and cw laser-pumped dye lasers: (a) a high quantum fluorescence yield and (b) low triplet-triplet (T-T) absorption over the fluorescence (laser action) spectral region of the laser dye. The author, therefore, recorded the T-T absorption spectrum of syn-(CH_3,CH_3)B. We compared the laser action parameters of syn-(CH_3,CH_3)B with those of Coumarin 30. Both syn-(CH_3,CH_3)B and Coumarin 30 showed laser action in the same spectral region. syn-(CH_3,Ch_3)B lased only 30% less efficient than did Coumarin 30. Reprints. (mjm)

36959 (AD-A–205080/5/XAB) **Laser action in chromium-activated forsterite for near-infrared excitation.** Petricevic, V.; Gayen, S.K.; Alfano, R.R. City Univ. of New York, NY (USA). 15 Oct 1988. 3p. Available from NTIS, PC A02/MF A01.

Pub. in Applied Optics, Vol. 27, No. 20, 4162-4163 (15 Oct 1988).

Recently, the authors reported room-temperature pulsed-laser action in chromium-activated forsterite (Cr:Mg_2SiO_4). The free-running laser output was centered at 1235 nm with a spectral bandwidth (full width at half-maximum,FWHM) of 22 nm. The laser emission was stimulated by the 532-nm excitation of the green-red absorption band of the system. The crystal is characterized by a shallow absorption band spanning the 850-1200-nm wavelength range, which overlaps a significant portion of the emission spectrum and was previously thought to inhibit laser action in that region. In this communication, laser action in chromium-doped forsterite for 1064-nm excitation of this band is reported. The near infrared absorption thus turns out to be effective in populating the initial level of the lasing transition.

36960 (AD-A–205233/0/XAB) **Single-frequency microchip Nd lasers.** Zayhowski, J.D.; Mooradian, A. Massachusetts Inst. of Tech., Lexington, MA (USA). Lincoln Lab. 1 Jan 1989. 4p. (JA–6171). Available from NTIS, PC A02/MF A01.

Pub. in Optics Letters, Vol. 14, 24-26(1 Jan 1989).

Optically pumped, single-frequency, Nd-doped, solid-state lasers were constructed using flat-flat cavities, which were diced from large dielectrically coated wafers of various crystals. For example, a Nd:YAG laser with a cavity length of 730 um operated at room temperature in a single longitudinal mode from a threshold of less than 1 mW to greater than 40 times the threshold. The slope efficiency was greater than 30%. Heterodyne measurements showed an instrument-limited linewidth of 5 kHz. The microchip lasers demonstrate ways to reduce greatly the cost and complexity of fabricating small lasers and electro-optic devices.

36961 (CONF-8808146–17) **Free electron laser with small period wiggler and sheet electron beam: A study of the feasibility of operation at 300 GHz with 1 MW CW output power.** Booske, J.H.; Granatstein, V.L.; Antonsen, T.M. Jr.; Destler, W.W.; Finn, J.; Latham, P.E.; Levush, B.; Mayergoyz, I.D.; Radack, D.; Rodgers, J. Maryland Univ., College Park, MD (USA). Lab. for Plasma Research. 1988. 16p. Sponsored by DOE Energy Research. DOE Contract FG05-87ER52147. From 10. international free-electron laser conference; Jerusalem, Israel; 29 Aug - 2 sep 1988. Order Number DE89014759/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The use of a small period wiggler (ℓ_w < 1 cm) together with a sheet electron beam has been proposed as a low cost source of power for electron cyclotron resonance heating (ECRH) in magnetic fusion plasmas. Other potential applications include space-based radar systems. We have experimentally demonstrated stable propagation of a sheet beam (18 A. 1 mm x 20 mm) through a ten-period wiggler electromagnet with peak field of 1.2 kG. Calculation of microwave wall heating and pressurized water cooling have also been carried out, and indicate the feasibility of operating a near-millimeter, sheet beam FEL with an output power of 1 MW CW (corresponding to power density into the walls of 2 kW/cm^2). Based on these encouraging results, a proof-of-principle experiment is being assembled, and is aimed at demonstrating FEL operating at 120 GHz with 300 kW output power in 1 μs pulses: electron energy would be 410 keV. Preliminary design of a 300 GHz 1 MW FEL with an untapered wiggler is also presented. 10 refs., 5 figs., 3 tabs.

36962 (CONF-8904239–Summ.) **Proceedings of the small period wiggler designs workshop: Summary.** Los Alamos National Lab., NM (USA). 1989. 11p. Sponsored by DOE Energy Research. DOE Contract FG05-87ER52147. From Small-Period Wiggler Designs workshop; Los Alamos, NM, USA; 13 Apr 1989. Order Number DE89014758/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This paper briefly discusses the following: comments on wiggler designs; electromagnetic and electromagnet wigglers; microfabrication-compatible wiggler designs; superconducting wigglers with rare earth inserts; wiggler scaling in high power systems; current sheet wigglers; micro-permanent magnet wigglers; and pulsed wire wigglers

36963 (LA-UR–89-1932) **An improved hibachi support structure for electron-beam diode foils.** Kang, M.; Weinstein, B.; Rose, E.A. Los Alamos National Lab., NM (USA). 1989. 15p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890665–30: 7. Institute of Electrical and Electronics Engineers pulsed power conference, Monterey, California, USA, 12-14 Jun 1989). Order Number DE89014023/JAW. Available from NTIS, PC A03/MF A01 - OSTI.

AURORA is a KrF laser system at Los Alamos designed to demonstrate the feasibility of optical multiplexing for KrF lasers. The first two amplifiers in the amplifier chain are the Small Aperture Module (SAM) and the Pre-Amplifier (PA). This paper will describe the engineering design of replacement hibachis for the SAM and PA as part of a general upgrade to increase e-beam pumping. Hibachi shading loss mechanisms are briefly discussed. A simple model that calculates relative shading losses between hibachis for the axial-field-free case is presented. Based on modeling results, sample hibachi slots were fabricated and foils tested to destruction to verify standard membrane stress equation. Test results were used in the design and fabrication of hibachis that were installed on the amplifiers. Relative energy deposition measurements using capacitive manometers are presented. 10 refs., 3 tabs.

36964 (LBL–27034) **Prospects for the FEL [Free Electron Laser].** Sessler, A.M. Lawrence Berkeley Lab., CA (USA). Apr 1989. 18p. Sponsored by DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-8904228–1: CERN accelerator school, Chester, UK, 6-13 Apr 1989). Order Number DE89012998/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The future for FELs depends upon the very large number of applications which is envisioned for them. These grow out of the FEL extensive range of wavelengths, tunability, and high power capability. High power requires demonstration of optical guiding. Tunability has already been demonstrated. And the effort to extend the range of wavelengths is ever ongoing. The future will also bring more work on gas-loaded FELs, on electromagnetic wigglers, and on harmonic generation. We can, also, look forward to observation of various new effects, a few of which will be described. Finally, a list of various FEL projects around the world will be given. 12 refs., 5 figs., 8 tabs.

36965 (LBL–27035) **High-power, high-efficiency FELs.** Sessler, A.M. Lawrence Berkeley Lab., CA (USA). Apr 1989. 15p. Sponsored by DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-8904228–2: CERN accelerator school, Chester, UK, 6-13 Apr 1989). Order Number DE89013002/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

High power, high efficiency FELs require tapering, as the particles loose energy, so as to maintain resonance between the electromagnetic wave and the particles. They also require focusing of the particles (usually done with curved pole faces) and focusing of the electromagnetic wave (i.e. optical guiding). In addition, one must avoid transverse beam instabilities (primarily resistive wall) and longitudinal instabilities (i.e sidebands). 18 refs., 7 figs., 3 tabs.

36966 (UCRL–98850) **Tapering FEL amplifiers in wiggler period and field.** Shay, H.D.; Deis, G.A.; Scharlemann, E.T.; Smith, T.E. Jr. Lawrence Livermore National Lab., CA (USA). 13 Mar 1989. 24p. Sponsored by Department of Defense. DOE Contract W-7405-ENG-48. (CONF-8808146–16: 10. international free-electron laser conference, Jerusalem, Israel, 29 Aug - 2 sep 1988). Order Number DE89014050/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Tapering a free-electron laser (FEL) amplifier to improve extraction after gain saturation can be accomplished by varying both the wiggler period and the wiggler field. This paper considers specific FEL designs and demonstrates the improvement in extraction that can be achieved by utilizing both variations. Fabrication considerations make a continuously varying wiggler period impractical for long wigglers, and so this technique entails discontinuous steps in the wiggler period. Such steps in wiggler period must be introduced in a manner such that they do not introduce steering in the electron beam for reasonable ranges of transverse velocities and energies nor induce a large spread in phase shifts. We discuss such techniques. 8 refs., 7 figs., 1 tab.

36967 **Nonlinear optical beam manipulation, beam combining, and atmospheric propagation.** SPIE - Volume 874. Fischer, R.A. 334p. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (1988). (CONF-8801121–: Nonlinear optical beam manipulation, beam combining, and atmospheric propagation, Los Angeles, California, USA, 11-14 Jan 1988).

These proceedings collect papers on optics: Topics include: diffraction properties of laser speckle, coherent beam combination by plasma modes, nonlinear responses, deformable mirrors, imaging radiometers, electron beam propagation in inhomogeneous media, and stability of laser beams in a structured environment.

36968 **Spectroscopy of absorbers in rare gas-halide laser plasmas.** Eden, J.G. (Univ. of Illinois, Urbana, IL (US)); Schloss, J.H.; Kane, D.J.; Shannon, D.C.; Abele, C.C.; McCown, A.W. v.v of Gas laser technology. Sauerbrey, R.A.; Tillotson, J.H.; Chenausky, P.P. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (1988). (CONF-8801118–: Gas laser technology, Los Angeles, California, USA, 11-12 Jan 1988).

The spectroscopy and chemical kinetics of small molecules known (or believed) to absorb in rare gas-halide laser plasmas are being studied by laser excitation and probing techniques. Two examples from recent experiments - inter-Rydberg absorption spectroscopy of Ar_2 and photoassociation of Kr-F collision pairs - are described.

36969 **Sideband generation in saturated pulsed dye amplifiers with multiple cw single mode injection.** Comaskey, B. (Lawrence Livermore National Lab., Laser Isotope Separation Program, P.O. Box 5508, Livermore, CA (US)); Daly, T.; Haynam, C.; Morris, J.; Paisner, J.; Young, R. v.v of Pulsed single-frequency lasers. Bischel, W.K.; Rahn, L.A. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (1988). (CONF-880199–: Pulsed single frequency lasers: technology and applications, Los Angeles, California, USA, 12-13 Jan 1988).

The output spectral characteristics of fully saturated pulsed dye amplifiers for multimode input waves having amplitude modulation (AM) are modeled and compared with experimental measurement. The AM input in our experiments was generated by combining the outputs of two single-mode dye lasers. The spectral output of the saturated dye amplifiers consisted of the input frequencies and several sidebands spaced by the input difference or beat frequency. For our experimental system with kiton red dye amplifiers, up to 20% of the output intensity was contained in these sidebands. Sideband production was observed to decrease as the beat frequency increased with a characteristic half-width of approximately 10 GHz.

36970 **Calibration of beam power monitors for laser welding.** Thacher, P.D. (Sandia National Labs., Organization 7241, P.O. Box 5800, Albuquerque, NM (US)). v.v of Laser beam radiometry. Sanders, A.A. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (1988). (CONF-8801131–: Laser beam radiometry, Los Angeles, CA, USA, 14-15 Jan 1988).

A detailed microfacies and seismic interpretation was conducted for the Caddo lime formation, a relatively unstudied Middle Pennsylvanian hydrocarbon reservoir in northcentral Texas. Five cores from Chalky Mountain field in Taylor County were studied and found to contain eight distinct but gradational facies: clay shale, stylonodular bedded wackestone, clay-rich packstone, crinoid-bryozoan packstone, algal wackestone to boundstones, skeletal-algal grainstone, oolitic-skeletal grainstone, and coral-skeletal packstone. The limestone facies form three cyclic packages, each of which contains a transgressive facies followed by a shoaling upward regressive sequence of facies. The cycles are bounded by the transgressive, clay-rich limestone facies identified in the gamma-ray logs as positive radioactive kicks that can be correlated between wells. Well logs, synthetic seismograms, and high-resolution seismic reflection profiles were used to map the subsurface structure of the Caddo Lime in the Chalky Mountain field area.

36971 **Nd:Cr:GSGG, will it replace Nd:YAG.** Stokowski, S.E. (Lawrence Livermore National Lab., Univ. of California, P.O. Box 5508, L-490, Livermore, CA (US)). v.v of New slab and solid-state laser technologies and applications. Guch, S.; Eggleston, J. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (1987). (CONF-870132–: OE/LASE '87, Los Angeles, CA, USA, 11-16 Jan 1987).

Gadolinium scandium gallium garnet (GSGG) codoped with neodymium (Nd) and chromium (Cr) is a new laser material that can make more efficient lasers. The author compares it to Nd-doped yttrium aluminum garnet (YAG) for two types of systems: large zig-zag slab lasers and small rod lasers. Nd:Cr:GSGG has a significant advantage over Nd:YAG in large systems because of its high efficiency and availability in large sizes. In small rod systems, though, the larger thermal lensing and birefringence in Nd:Cr:GSGG make it less desirable than Nd:YAG from an optical standpoint, but its high efficiency means that laser system size and weight can be reduced. The author reviews progress in obtaining large Nd:Cr:GSGG slabs. In this effort, Allied-Signal Corp. has successfully grown 5-inch diameter Nd:Cr:GSGG boules.

36972 **Pulse-train amplification of subnanosecond near-transform-limited KrF laser pulses.** Raymond, T.D. (Sandia National Labs., Albuquerque, NM (US)); Reiser, C.; Adams, R.G.; Michie, R.B.; Woods, C. v.v of Pulsed single-frequency lasers. Bischel, W.K.; Rahn, L.A. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (1988). (CONF-880199–: Pulsed single frequency lasers: technology and applications, Los Angeles, California, USA, 12-13 Jan 1988).

The authors show that extraction of energy in the form of a train of subnanosecond pulses from a discharge-pumped KrF excimer amplifier is an efficient means of enhancing the intensity of the laser radiation. The effect of interpulse time separation and pulse width are investigated experimentally. Intensity enhancements of up to 7x above steady-state, with extraction efficiencies in excess of 60% of the steady-state value, were obtained by amplifying a train of 0.4-nsec full-width-at-half-maximum (FWHM) pulses separated by 5 nsec.

36973 **Coherent VUV laser at 130nm.** Muller, C.H. III (Spectra Technology, Inc., 2755 Northup Way, Bellevue, WA (US)); Lowenthal, D.D.; DeFaccio, M.A.; Cimolino, M.; Hauck, J.P. v.v of Pulsed single-frequency lasers. Bischel, W.K.; Rahn, L.A. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (1988). (CONF-880199–: Pulsed single frequency lasers: technology and applications, Los Angeles, California, USA, 12-13 Jan 1988).

Vacuum ultraviolet laser output energies of 0.25 mJ 92MW cm^{-2} (unfocused) at 130 nm have been achieved using four-wave sum-frequency mixing in mercury. High energy conversion efficiencies of 2.7 percent have been demonstrated in a collimated beam geometry over 1 meter interaction lengths. The 130 nm radiation is tunable over 2.5 cm^{-1} and the pulse length is 2.2 ns. The experimental

facility assembled to produce this efficient VUV laser will be described, and comparison between experimental measurements and theory are provided.

36974 Coherent VUV source at 130 nm. Smith, A.V. (Sandia National Labs., Albuquerque, NM (US)); Hadley, G.R.; Alford, W.J. v.v of Pulsed single-frequency lasers. Bischel, W.K.; Rahn, L.A. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (1988). (CONF-880199–: Pulsed single frequency lasers: technology and applications, Los Angeles, California, USA, 12-13 Jan 1988).

The authors goal is to maximize conversion efficiency of sum-frequency mixing in an energy scalable system. They analyze 130.2-nm generation via two-photon-resonant four-wave mixing in Hg vapor for unfocused light beams emphasizing an understanding of efficiency-limiting processes. Their calculations, based on their measurements of Hg dipole matrix elements, indicate that mixing efficiencies of 5 - 10% should be possible.

36975 Stability of laser beams in a structured environment. Keskinen, M.J. (Geophysical and Plasma Dynamics Branch, Plasma Physics Div., Naval Research Lab., Washington, DC (US)); Lee, Y.C. v.v of Nonlinear optical beam manipulation, beam combining, and atmospheric propagation. Fischer, R.A. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (1988). (CONF-8801121–: Nonlinear optical beam manipulation, beam combining, and atmospheric propagation, Los Angeles, California, USA, 11-14 Jan 1988).

Parametric instabilities of laser radiation in a structured space plasma environment have been surveyed. The authors compute approximate thresholds and growth rates for stimulated Raman scattering, stimulated Brillouin scattering, stimulated Compton scattering, and modulation/filamentation processes.

36976 (CONF-881123–4) **Pressure drop and heat transfer characteristics of nearly neutrally buoyant particulate slurry for advanced energy transmission fluids.** Liu, K.V.; Choi, U.S.; Kasza, K.E. Argonne National Lab., IL (USA). 1988. 25p. Sponsored by DOE Energy Research. DOE Contract W-31109-ENG-38. From 3. international symposium on liquid-solid flows (WAM); Chicago, IL, USA; 28 Nov - 2 dec 1988. Order Number DE89013645/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Under sponsorship of the US Department of Energy, Argonne National Laboratory (ANL) is developing high-performance energy transmission fluids that have the potential to substantially reduce frictional losses and improve heat transfer in a variety of thermal systems, allowing the use of smaller piping, pumps, heat exchangers, and storage tanks. This paper presents experimental results and discusses the pressure drop and heat transfer characteristics of non-melting slurry flows. The experimental data obtained in this study improve the fundamental understanding of slurry fluid mechanics and heat transfer, and provide support for the use of slurries as an advanced energy transmission fluids in thermal system applications. 6 refs., 9 figs.

36977 (CONF-890604–12) **A central difference type approximation of convection in fluid flow.** Tzanos, C.P. Argonne National Lab., IL (USA). 1989. 6p. Sponsored by DOE Nuclear Energy. DOE Contract W-31109-ENG-38. From Annual meeting of the American Nuclear Society; Atlanta, GA, USA; 4-8 Jun 1989. Order Number DE89013282/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

In fluid flow and heat transfer problems, to eliminate instability and oscillations resulting from the numerical approximation of the convection term, it is common practice to use first order upwind differencing. For example, first order upwind differencing is used in codes like COMMIX and PHOENICS. However, in problems characterized by high Peclet numbers this approach is highly inaccurate unless an excessive number of nodes is used. To eliminate this difficulty, a method of grid adaptation using central differencing in one-dimensional problems was presented. In the effort to extend this approach to 2-D and 3-D problems a new method was developed for multidimensional problems that is superior to first order upwind differencing even for a few non-adaptive grid points. This method is presented in this work. 4 refs., 1 fig.

36978 (CONF-890794–1) **Interfacial area measurement methods.** Tan, M.J. Argonne National Lab., IL (USA). 1989. 19p. Sponsored by DOE Energy Research. DOE Contract W-31109-ENG-38. From 3. American Society of Civil Engineers/American Society of Mechanical Engineers mechanics conference; San Diego, CA, USA; 9-12 Jul 1989. Order Number DE89013426/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Knowledge of local specific interfacial area is required for analysis and prediction of transient and steady characteristics of two-phase flow systems using the two-fluid models. Based on a survey of published work on the subject of specific interfacial area, it is recognized that there is virtually no data base for local specific interfacial area. This report describes the ongoing development of experimental techniques for measurement of local specific interfacial area in gas-liquid and liquid-liquid two-phase systems. Mathematical relations between local specific interfacial area and measurable quantities are derived based on kinematics and geometry. Two methods for determining local specific interfacial area are identified; both entail detection of passage of interfaces through fixed locations in the flow field. A multiple-sensor electrical-resistivity-probe technique is being developed for determination of local specific interfacial area in vertical gas-liquid bubbly flows. The technique consists of simultaneous measurements at two or four locations in the two-phase flow field of the local electrical resistivity of the two-phase mixture. Methods for data analysis are described. Limitations of the technique are briefly discussed. 11 refs., 5 figs.

36979 (CONF-8906131–1) **Time- and volume-averaged conservation equations for multiphase flow.** Sha, W.T.; Chao, B.T.; Soo, S.L. Argonne National Lab., IL (USA). 1989. 20p. Sponsored by DOE Conservation & Renewable Energy. DOE Contract W-31109-ENG-38. From 2. international symposium on multiphase flow and heat transfer; Xian, China; 22-24 Jun 1989. Order Number DE89012418/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Governing equations for multiphase flow have been rigorously derived via local volume averaging of single-phase conservation equations of mass, momentum, and energy, followed by time averaging. This averaging procedure leads to a set of differential-integral equations in which the area integrals represent interfacial transport. The spatial averaging theorems are subject to the length scale restriction $d \ll \ell \leq L$, where d, ℓ, and L are, respectively, the characteristic length of the dispersed phase, the averaging volume, and the physical system. The equations presented are appropriate for dispersed systems. 26 refs., 1 fig.

36980 (INIS-SU–76, pp. 10-12) **Comparison of mathematical models of non-equilibrium boiling for calculation of non-stationary processes.** Filin, R.D. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1988. (In Russian). In *Physics and technology of atomic reactors. Scientific-technical collection.* Order Number DE89012164/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 1.

Various descriptions of non-equilibrium boiling used for the calculation of non-stationary processes in steam-generating channels are compared. It is shown that coincidence of model and object characteristics, which can be attained for the descriptions considered in statics, does not guarantee the coincidence of results in dynamics, due to different dynamical properties of dependences in the descriptions. 7 refs.; 3 figs.

36981 (KFK–4399) **Gas-liquid flow in dividing Tee-junctions with a horizontal inlet and different branch orientations and diameters.** Reimann, J.; Brinkmann, H.J.; Domanski, R. Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorbauelemente; Warsaw Univ. (Poland). Dec 1988. 247p. Order Number DE89788353/JAW. Available from NTIS (US Sales Only), PC A11/MF A01.

An extensive data base is presented, summarizing previous and new experiments, on the phase redistribution and pressure differences for a gas-liquid mixture flowing through the horizontal inlet pipe (diameter D_1=50 mm) of a Tee-junction. Branch to inlet diameter ratios of D_3/D_1 = 1; 0.52; 0.2; and 0.08 were investigated. The branch orientation was horizontal, vertical upward or vertical downward. Mostly air-water experiments were performed with pressures between 0.4 and 1 MPa. Experiments with steam-water flows at pressures between 1.5 and 10 MPa were performed for D_3/D_1 = 1 and a horizontal branch. The results on phase redistribution and pressure drop are compared with other experimental data and model predictions, published previously by various authors. There are clear trends in the experimental data on phase redistribution: For the upward branch, the branch quality x_3 is the highest, for the downward branch the lowest for constant inlet conditions. With decreasing branch diameter, in general, the branch quality increases for the same branch mass flow rate. This tendency can be reversed for $D_3/D_1 << 1$ due to the effect of local phase distribution in the inlet pipe and for $D_3/D_1 \simeq 1$ and inclined branch due to flow reversal effects in the branch pipe.

36982 (UCID–21715) **Stemming temperature changes during emplacement: Experimental results and analysis.** Stein, W.; Comfort, W.J. III. Lawrence Livermore National Lab., CA (USA). May 1989. 24p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE89014305/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The process of stemming a deep hole with magnetite, which was initially hotter or cooler than the ambient downhole temperature, was investigated experimentally. The specific objective of the experiment was to determine the temperature changes that occur as the magnetite falls downhole. A numerical model of heat transfer was developed to calculate the stemming temperature changes and was calibrated with the experimental results. Experimental data show that initially hot stemming, 122°F, arrives at a downhole depth of 1284 feet at approximately 74°F when stemmed at 100 tons/hour for an 8 foot diameter hole. Initial downhole temperatures were near 66°F. For initially cold stemming, the temperature of stemming arriving downhole was also close to ambient downhole temperature conditions. The developed calculational model can be applied to predict stemming temperature changes as a function of hole depth, hole diameter, type of stemming material, initial stemming temperature, stemming rate, and ambient hole wall temperature conditions as a function of depth. 8 figs., 5 tabs.

36983 **Modeling of flow fields in oscillating droplets.** Scott, T.C. (Oak Ridge National Lab., Oak Ridge, TN (US)). v.v of Chemical separations. King, J.C.; Navratil, J.D. Litarvin Literature, Arvada, CO (1986). (CONF-860411–: 1. international conference on separations science and technology, New York, New York, USA, 15-17 Apr 1986).

Quantitative and qualitative flow visualization techniques have been used to model flow fields which occur in the droplet-continuum system for liquid-liquid solvent extraction. It was determined that the streamlines for flow in and around oscillating droplets can be modeled as the vectorial addition of low-Reynolds number Hadamard flow and flow caused by an oscillating Dirichlet ellipsoid.

4205 Materials Testing

36984 (CONF-890721–25) **Structural integrity evaluation based on an innovative field indentation microprobe.** Haggag, F.M.; Nanstad, R.K.; Braski, D.N. Oak Ridge National Lab., TN (USA). 1989. 7p. Sponsored by DOE/ER;NRC. DOE Contract AC05-84OR21400. From Joint ASME/JSME pressure vessel and piping conference; Honolulu, Hawaii, USA; 23-27 Jul 1989. Order Number DE89010840/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A brief description is given for a field indentation microprobe (FIM) apparatus which was developed to evaluate, nondestructively in situ, the integrity of metallic structures. The FIM consists of an automated ball indentation (ABI) unit for determining the mechanical properties (yield strength, flow properties, fracture toughness, etc.) and a nondestructive evaluation (NDE) unit (consisting of ultrasonic transducers and a video camera) for determining the physical properties such as crack size, material pile-up around indentation, and residual stress presence and orientation. The laboratory version used here performs only ABI testing. Results of the laboratory version of the FIM tests on unirradiated and irradiated A212 grade B pressure vessel steel are discussed in this paper. Excellent agreement was obtained between yield strength and flow properties (true-stress/true-plastic-strain curve) measured by the ABI tests and those of uniaxial tensile tests. 14 refs., 9 figs., 1 tab.

36985 **Intergranular fracture in metals.** Briant, C.L. (General Electric Co., Schenectady, NY (USA)). pp. 22 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

This paper concerns brittle intergranular fracture in metals. It is shown that the primary cause of intergranular fracture is impurity segregation. However, the ability of a given concentration of an embrittling species to cause fracture can be modified by many factors. These include the orientation of the grain boundary with respect to the stress axis, the structure of the grain boundary, the presence of second phase particles, and the general mechanical response of the material. It will be shown that intergranular fracture can be considered as a simple dissociative chemical reaction and models to explain the bond weakening caused by impurities will be discussed.

36986 **Subcritical crack growth in metal-ceramic-interfaces.** Mueller, M. (Max-Planck-Institut fuer Metallforschung, Stuttgart (West Germany)); Kromp, K.; Gerold, V. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

A method is presented to investigate the adhesion strength of thin metal films on alumina substrates. For this purpose the extension behavior of an interface crack in the composite was observed in a 3-point bending test. The composite consists of a 96% alumina and AgPd-alloy with a thickness of 10-50 μm. A compound system is produced from the composite by glueing alumina blocks to the alumina substrate and to the metal film respectively. Bending specimens are cut out of this compound system and are notched near the interface layer. By asymmetrical preloading an interface crack is produced as a crack starter. During the following bending test the controlled crack-extension is observed with a travelling microscope. The load-displacement diagram and the optically measured crack length are used to calculate the crack resistance R, which characterizes the adhesion strength of the metal film.

36987 **Hydrogen embrittlement in grain boundaries studied by fatigue crack propagation in Al-Zn-Mg bicrystals.** Niegel, A. (Max-Planck-Institut fuer Metallforschung, Stuttgart (West Germany)); Gudladt, H.J.; Gerold, V. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988). (CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

High cycle fatigue crack propagation in grain boundaries was studied in precipitation hardened Al-Zn-Mg specimens containing a single grain boundary (gb) perpendicular to the load axis. In peak-aged bicrystals tested in wet nitrogen atmospheres, cracks propagated in an intercrystalline manner. Under cyclic loading conditions two different mechanisms contribute to crack propagation which are termed stress corrosion cracking (SCC) and intergranular corrosion fatigue (CF). In both cases, it is well established that intercrystalline crack propagation is influenced by hydrogen penetrating into the gb during each load cycle. For SCC it is the hydrogen dissolved into the gb, resp. areas close to the boundary whereas for CF it is the trapped hydrogen which initiates the intergranular cracking. Both terms will be discussed under microstructural aspects.

36988 **Cyclic migration and fracture in solid solution alloys.** Raman, V. (TJ Watson Research Center, Yorktown Heights, NY (USA)); Langdon, T.G. pp. 6 of Interface science and engineering '87. Les Editions de Physique, Les Ulis Cedex, France (1988).

(CONF-870793–: Interface science and engineering '87: international conference on the structure and properties of internal interfaces, Lake Placid, New York, USA, 13-16 Jul 1987).

The role of grain boundary processes during fatigue testing at high temperatures has been studied in several pure metals. This paper summarizes grain boundary behavior in Al-3% Mg and Pb-2% Sn solid solution alloys deformed in fatigue at high temperatures. It is shown that there are significant differences in the processes occurring at grain boundaries in these alloys compared to those observed in pure metals. The implications of these observations in influencing high temperature fatigue fracture are discussed.

36989 (INFO–0249) **Fresh fuel verification feasibility study.** Atomic Energy Control Board, Ottawa, ON (Canada); BOT Engineering Ltd., Campbellville, ON (Canada). Jul 1987. 133p. Order Number DE89620174/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

The study examined several methods of verifying crates of fresh CANDU fuel without opening the crates. Of these methods only a passive gamma techniques and an active neutron technique were chosen as being appropriate. Computer simulation supported by physical measurements were performed to determine the applicability of various detectors, detector configurations, detector locations, etc. The results indicate that for the two techniques chosen a crate of fuel can be verified without its being opened provided modifications are made to the crate to permit a detector or source probes to be inserted. Estimates of the cost of modifying existing crates and procuring the measurement equipment are provided.

36990 (INIS-mf–11451) **Welding '88. Nondestructive testing of welded joints.** Ceskoslovenska Vedeckotechnicka Spolocnost, Bratislava (Czechoslovakia). Dom Techniky. Mar 1988. 138p. (In Slovak, Czech). (CONF-8803218–: Welding '88 - 3. conference on nondestructive testing of welded joints, Brno, Czechoslovakia, 3-4 Mar 1988). Order Number DE89618174/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

The proceedings of the international conference Welding '88 held in Brno (CS) on March 3 and 4, 1988 contains the full texts of 23 papers of which 11 fall under the INIS scope. (Z.M.).

36991 (INIS-mf–11982, pp. 15.1-15.16) **Benefits offered by an advanced US-technique in describing faults (ALOK).** Dressler, K. (Rheinisch-Westfaelischer Technischer Ueberwachungs-Verein e.V., Essen (Germany, F.R.)); Werden, B. Staatliche Materialpruefungsanstalt, Stuttgart (Germany, F.R.); Rheinisch-Westfaelischer Technischer Ueberwachungs-Verein e.V., Essen (Germany, F.R.). 1987. (In German). (CONF-8710410–: 13. MPA seminar on safety and reliability of pressure components: the contribution of component and large specimen testing to structural integrity assessment methodology, Stuttgart, Germany, F.R., 8-9 Oct 1987). In *Safety and reliability of pressure components with special emphasis on the contribution of component and large specimen testing to structural integrity assessment methodology. Vol. 1. Fracture mechanics, dynamic loading, nondestructive testing, radiation embrittlement.* Order Number DE89783126/JAW. Available from NTIS (US Sales Only), PC A99/MF A01.

The amplitude and transit time-locus curves (ALOK) are used to assess recorded ultrasonic signals. This not only includes the investigation of the amplitude variations which occur whilst shifting the detector relative to a reflector, but also the simultaneously occurring changes in the sonic pulse transit times. The ALOK-3 device was developed for small-scale production which incorporates an automated ultrasonic test-system and a complete computed read-out for data evaluation. The use of this compact device is not confined to the field of specialized analytic investigations of nuclear reactor components.

36992 (KURRI-TR–309) **Report on the instrumented Charpy impact test for metallic materials.** Kozuka, Toshihiko; Yoshida, Hiroyuki. Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst. Dec 1988. 25p. (In Japanese). Order Number DE89790848/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

An instrumented testing method has been developed for Charpy impact test for steels, aluminum alloys and other materials. Using the instrumented Charpy testing machine developed, it is clearly estimated that the method is good enough to give us detailed information about the impact properties of these metallic materials.

36993 (PB–89-861215/XAB) **Nondestructive testing for microelectronics, semiconductors, and superconductors. January 1970-April 1989 (Citations from the NTIS data base). Report for January 1970-April 1989.** National Technical Information Service, Springfield, VA (USA). May 1989. 161p. Available from NTISPC N01/MF N01.

Supersedes PB–87-854295.

This bibliography contains citations concerning the theory and various techniques for nondestructive testing or examination of microelectronic devices, semiconductor devices, and superconductors for the detection of flaws or defects that affect their properties and behavior. Some attention is also given to uniformity and quality control in integrated-circuit manufacturing. (This updated bibliography contains 319 citations, 93 of which are new entries to the previous edition.)

36994 (RFP–4297) **A comprehensive guide to the literature on acoustic emission from composites: Supplement 2.** Drouillard, T.F. Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant. 25 Apr 1989. 22p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP03533. (CONF-890789–1: 3. international symposium on acoustic emission from reinforced composites, Paris, France, 17-21 Jul 1989). Order Number DE89013524/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Comprehensive bibliographies on the subject of acoustic emission (AE) from composites were compiled for the First and Second International Symposiums on Acoustic Emission from Reinforced Composites which were held in San Francisco, California, July 19-21, 1983, and Montreal, Canada, July 21-25, 1986. The current bibliography is the third in the series. It presents 212 references of new material. The material is presented in the same format as previously used, which consists of a bibliographic section, an author index, and a subject index. Although not all-inclusive, this series of bibliographies presents a compilation of the bulk of world literature published on the subject of acoustic emission from composites.

36995 (SAND–89-0343C) **Strain to failure of pressurized thick wall cylinders.** Priddy, T.G.; Roach, D.P. Sandia National Labs., Albuquerque, NM (USA). 1989. 20p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-890721–20: Joint ASME/JSME pressure vessel and piping conference, Honolulu, Hawaii, USA, 23-27 Jul 1989). Order Number DE89009969/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The determination of the fully plastic response and pressure limit of a highly pressurized vessel is of considerable importance in design. The plastic-strain response during and following autofrettage operations, in comparison with the limiting strain condition, is of special interest. This paper presents the results of an analysis method for thick wall, high pressure, cylinders where the effective plastic strain distribution through the thickness is the material response variable of primary interest. The limiting value of this effective plastic strain depends on the level of tensile-stress triaxiality which also varies through the thickness. This strain-to-failure criterion is used to predict the complete pressure versus strain response and the maximum pressure for test cylinders. A simple model of effective-stress versus effective plastic strain is employed. This model is quantified by data taken from uniaxial, tension, true-stress-strain curves and from the fracture zone of the tensile specimen. A sample calculation is included and, in a companion paper, a series of burst tubes having properties ranging from brittle to ductile are compared with this analytical method. 21 refs., 5 figs., 2 tabs.

36996 (SAND–89-0727) **Description of the NanoΔIndenter™; An ultra-low-load microhardness indentation test machine.** Schmale, D.T.; Bourcier, R.J. Sandia National Labs., Albuquerque, NM (USA). Jun 1989. 25p. Sponsored by DOE Nuclear Energy. DOE Contract AC04-76DP00789. Order Number DE89014608/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report provides an introduction to the capabilities of a new experimental test system recently acquired by Department 1830 and installed into the Organization 1000 bay of the microelectronics

Development Laboratory, Building 858. This device - the Nano∆Indenter{Trademark} - is a state of the art ultra-low load indentation hardness tester. It is a computer-controlled load and depth sensing instrument with depth resolution of 0.2 nm and load resolution of 0.3 μN. Initial testing has now been performed using this machine, verifying that it will be a unique addition to our existing mechanical test capabilities. 3 refs., 8 figs.

36997 (SAND–89-1406C) **Ultrasonic systems and system development at SNL Albuquerque.** Shurtleff, W.W. Sandia National Labs., Albuquerque, NM (USA). 1989. 11p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-8906139–1: 31. weapons agencies nondestructive testing organization, Kansas City, MO, USA, 5-9 Jun 1989). Order Number DE89013164/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

With completion of the High Precision Ultrasonic Scanning System (HPUSS) and purchase of the Olympus acoustic microscope, the SNL Albuquerque NDE divisions now have the capability to ultrasonically scan almost any size and shape of test object. The general purpose ultrasonic scanning system, the high precision ultrasonic scanning system, and the acoustic microscope cover a wide resolution and magnification range. The rest of this paper describes the three systems in more detail and talks about future ultrasonic system development at Sandia. 5 figs.

36998 (UCRL–101051) **A proposal of more expedient methods of testing machine tools.** Hauschildt, H.E. Lawrence Livermore National Lab., CA (USA). 10 May 1989. 10p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8905158–1: IMOG maintenance subgroup, Denver, CO, USA, 17-18 May 1989). Order Number DE89013033/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In the continuing search for more efficient means of testing machine tools, there are some recent experiences that should be shared. This report will discuss techniques, some old, some new, that are worthwhile evaluating for application as part of a machine tool maintenance function.

36999 (AD-A–205141/5/XAB) **Thin-film optics for signal-processing applications. Final report, 1 September 1986-31 May 1988.** Warde, C. Massachusetts Inst. of Tech., Cambridge, MA (USA). Dept. of Electrical Engineering and Computer Science. 25 Jan 1989. 6p. Available from NTIS, PC A02/MF A01.

High-resolution, high-speed, spatial light modulators that offer excellent spatial uniformity are the key devices impeding progress in the areas of optical information processing and computing. The thrust of the MIT research effort is in the area of materials, devices, and systems for optical information processing. The research is focused on (1) growth, processing, and characterization of optical crystals for spatial light modulation, (2) spatial light modulator prototype device development, and (3) applications of spatial light modulators in symbolic optical processors. This final report describes the purchase, assembly, and operation of an RF sputtering system that is supporting a number of these and other DOD-sponsored research programs at MIT.

37000 (CONF-890744–1) **Tool integration and enhancement for standard cell designs.** Britton, C.L. Jr.; Alley, G.T.; Bryan, W.L.; Emery, M.S.; Ericson, M.N.; Bouldin, D.W.; Newport, D.F. Oak Ridge National Lab., TN (USA). 1989. 14p. Sponsored by Department of Defense. DOE Contract AC05-84OR21400. From VLSI education conference and exposition; Santa Clara, California, USA; 19-21 Jul 1989. Order Number DE89007516/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Application-specific integrated circuits designed using standard cells minimize the training and development time for engineers while maximizing the likelihood of obtaining functional silicon. By integrating and enhancing existing computer-aided design tools, it is now possible to support this methodology with a low-cost set of tools that also makes optimum use of computing resources. Personal computers are used for schematic capture and logic-level simulation, while engineering workstations are used for physical placement and routing as well as switch-level simulation, timing analysis, and fault grading. Examples of projects implemented using this tool set are given. 2 figs., 15 refs.

37001 (CONF-8906133–1) **A remote sensor/cable identifier.** Andrews, W.H. Jr.; Baker, S.P. Oak Ridge National Lab., TN (USA). 1989. 5p. Sponsored by National Aeronautics & Space Administration. DOE Contract AC05-84OR21400. From 15. transducer workshop; Cocoa Beach, FL, USA; 20-22 Jun 1989. Order Number DE89013050/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Errors in field wiring can result in significant correction costs in erroneous or unusable data, or in serious accidents. Detailed field wiring checkout and rework are tedious and expensive, but they are essential steps in the quality assurance process for large, complex instrumentation and control systems. A recent Oak Ridge National Laboratory (ORNL) development, the remote sensor/cable identifier (RSCI), automates verification of field wiring. In the RSCI system, an identifier module is installed on or integrated into each component (sensor, actuator, cable, distribution panel, etc.) to be verified. Interrogator modules, controlled by a personal computer (PC), are installed at the connections of the field wiring to the inputs of the data acquisition and control system (DACS). Interrogator modules poll the component connected to each channel of the DACS and are able to determine the path taken by each channel's signal to or from the end device for that channel. The system will provide not only the ID code for the cables and patch panels in the path to a particular sensor or actuator, but individual cable conductor IDs as well. One version of the system uses existing signal wires for communications between RSCI modules. Another, more powerful version requires a dedicated conductor in each cable. Both versions can operate with or without instrument power applied, and neither interfaces with the normal operation of the DACS. Identifier modules can provide a variety of information including status and calibration data. 3 figs.

37002 (LA-UR–89-489) **Reliability estimates for large satellite memories in low earth orbits.** Evans, E.P.; Roeske, S.B.; Browning, J.S.; Holtkamp, D.B.; Stoddard, G.B. Los Alamos National Lab., NM (USA). 1989. 4p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890723–6: 26. annual conference on nuclear and space radiation effects, Marco Island, Florida, USA, 24-28 Jul 1989). Order Number DE89007764/JAW. Available from NTIS, PC A02/MF A01 - OSTI.

Los Alamos and Sandia National Laboratories are building an ultrasoft x-ray space telescope experiment, designed to be flown on a "cheap-sat." Reliability estimates for the combined total dose and single event environments are given for the on-board memories as large as 1 gigabit. 4 refs., 4 figs., 1 tab.

37003 (LA-UR–89-1905) **Calculational evaluation of plasma flow switches for the Los Alamos Foil Implosion Project.** Greene, A.E.; Bowers, R.L.; Oliphant, T.A.; Peterson, D.L.; Weiss, D.L. Los Alamos National Lab., NM (USA). 1989. 5p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890665–33: 7. Institute of Electrical and Electronics Engineers pulsed power conference, Monterey, CA, USA, 12-14 Jun 1989). Order Number DE89014028/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The next system design under consideration for the Los Alamos Foil Implosion Project (Trailmaster) is projected to deliver in excess of 15 MA of electrical current produced by high-explosive driven flux compression generators to a foil load. A plasma flow switch is being investigated as the final pulse shaping step in this system. The performance of these switches is being evaluated using a wide variety of computational tools including zero-, one- and two-dimensional MHD codes and a 3-D view-factor radiation transport code. We are concerned with the effects of radiation from the switch plasma prior to switching current to the load, and the interaction of the switch plasma on existing perturbations and as a source of perturbation on the imploding load. 4 refs. 6 figs.

37004 (LA-UR–89-1911) **The Mark IX generator.** Fowler, C.M.; Caird, R.S. Los Alamos National Lab., NM (USA). 1989. 5p.

Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890665–32: 7. Institute of Electrical and Electronics Engineers pulsed power conference, Monterey, California, USA, 12-14 Jun 1989). Order Number DE89014026/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A large, explosive helical generator (the Mark IX) is described. The stator ID is 35.6 cm and the armature OD is 17.3 cm. The overall length is 112 cm. This generator delivered 11, 23.5, and 30 MA to 120-, 56-, 35-nH loads, respectively. A Marxing technique is used that enables us to employ over 1 MJ of capacitor bank energy for the initial current without destroying the generator prematurely by magnetic forces. The shot data were analyzed by first computing the generator inductance vs. time curve and then deriving the resistance vs. time curve from the data. This approach yields a useful characterization of the generator. 5 refs., 7 figs., 1 tab.

37005 (LA-UR–89-1941) **High voltage power condition systems powered by flux compression generators.** Reinovsky, R.E.; Lindemuth, I.R.; Vorthman, J.E. Los Alamos National Lab., NM (USA). 1989. 5p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890665–29: 7. Institute of Electrical and Electronics Engineers pulsed power conference, Monterey, CA, USA, 12-14 Jun 1989). Order Number DE89014259/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Compact, high-gain magnetic flux compressors (FCGs) are convenient sources of substantial energy for plasma-physics and electron-beam-physics experiments, but the need for high-voltage, fast-rising pulses is difficult to meet directly with conventional generators. While a variety of novel concepts employing simultaneous, axially- detonated explosive systems are under development, power-conditioning systems based on fuse opening switches and high-voltage transformers constitute another approach that complements the fundamental size, weight, and configuration of the small helical flux compressor. In this paper, we consider first a basic inductive store/opening switch circuit and the implications associated with, specifically, a fuse opening switch and an FCG energy source. We develop a general solution to a transformer/opening switch circuit—which also includes (as a special case) the direct inductive store/opening switch circuit (without transformer) and we report results of one elementary experiment demonstrating the feasibility of the approach. 9 figs.

37006 (LA-UR–89-1990) **Exploding metallic foils and fuses: A computational modeling update.** Lindemuth, I.R.; Reinovsky, R.E. Los Alamos National Lab., NM (USA). 1989. 16p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890665–27: 7. Institute of Electrical and Electronics Engineers pulsed power conference, Monterey, CA, USA, 12-14 Jun 1989). Order Number DE89014033/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Los Alamos computational model of exploding metallic foil behavior has been used to analyze and design a wide range of experiments in which exploding metallic foils were driven by the output current of capacitor banks and magnetic flux compression generators. Currents in the experiments ranged from 1 kA-16 MA and foil conduction times ranged from 200 ns-300 μs. The successes and limitations of the computational models are surveyed. 18 refs., 6 figs.

37007 (LA-UR–89-1992) **Explosively formed fuse opening switches for use in flux-compression generator circuits.** Goforth, J.H.; Marsh, S.P. Los Alamos National Lab., NM (USA). 1989. 12p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890710–15: 5. international conference on megagauss magnetic field generation and related topics, Novosibirsk, USSR, 3-7 Jul 1989). Order Number DE89014034/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Explosive-driven magnetic flux compression generators (explosive generators) provide for the generation of large amounts of energy compactly stored in a magnetic field. Opening switches for use in explosive generator circuits allow the energy to be used for applications requiring higher power than can be developed by the generators themselves. We have developed a type of opening switch that we describe as an explosively formed fuse (EFF). These switches are well suited to explosive generator circuits and provide a considerable enhancement of explosive pulsed-power capability. 10 refs., 14 figs.

37008 (LA-UR–89-2097) **A battery-powered flux compression generator system.** Vorthman, J.E.; Fowler, C.M.; Hoeberling, R.F.; Fazio, M.V. Los Alamos National Lab., NM (USA). 1989. 6p. Sponsored by Department of Defense. DOE Contract W-7405-ENG-36. (CONF-890710–5: 5. international conference on megagauss magnetic field generation and related topics, Novosibirsk, USSR, 3-7 Jul 1989). Order Number DE89014230/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Flux compression generators (FCGs) are primarily used as energy amplifiers. While a FCG can be made small, typically the "seed" energy that the FCG amplifies comes from a capacitator bank much larger and heavier than the FCG. If seed energy was supplied by a compact device, FCGs could be used as portable power supplies. One application of interest is to combine a compact seed source with a FCG and transformer. The result would be a self-contained power supply capable of producing a microsecond long, megavolt pulse. The objective of the work described in this paper was to make a seed source capable of energizing a standard Los Alamos plate FCG. The power supply was to be relatively small, light weight, and able to deliver at least 100-kJ to a 280-nH inductive load, e.g., plate FCG. 4 figs., 2 tabs.

37009 (LA-UR–89-2106) **High-voltage pulsed transformer development.** Freeman, B.L.; Rickel, D.G.; Ramrus, A.; Strickland, B.E. Los Alamos National Lab., NM (USA). 1989. 9p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890710–6: 5. international conference on megagauss magnetic field generation and related topics, Novosibirsk, USSR, 3-7 Jul 1989). Order Number DE89014227/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The theoretical designs for tape-wound, step-up transformers reported by Freeman and Bostick have been converted into physical units that have been subjected to experimental testing. The physical design of these transformers is relatively simple and uses common materials. The winding is composed of copper foil and Kapton film. The impregnating fluids have been fluorinert, propylene carbonate, and propylene carbonate with iron chloride. While several transformers were tested using a capacitor bank as the driver, most experiments have been driven with the 13.2-cm-wide by 52.8-cm-long plate generator. In these tests, both passive and active loads, ranging in impedance from 1.3 Ω to 200 Ω, have been energized. Reliable operation to 500 kV has been achieved with an associated voltage stress of $\leq$1.6 MV/cm. Effective coupling coefficients in the range of 0.85-0.92 have been measured. Results of this testing and prospects for further improvement are presented. 4 refs., 6 figs.

37010 (LA-UR–89-2137) **Disk generator with nearly shockless accelerated driver plate.** Fowler, C.M.; Hoeberling, R.F.; Marsh, S.P. Los Alamos National Lab., NM (USA). 1989. 9p. Sponsored by Department of Defense. DOE Contract W-7405-ENG-36. (CONF-890710–12: 5. international conference on megagauss magnetic field generation and related topics, Novosibirsk, USSR, 3-7 Jul 1989). Order Number DE89014220/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The "disk" generator was first conceived here as a useful magnetic field source for a class of in situ plasma experiments. Initial current is supplied (from a capacitor bank) to the generator through radial coaxial cables. It enters the top plate, passes through the central post, and exits through the top of the outer cylindrical glide surface, which is insulated from the top plate. The explosive over the top plate is initiated simultaneously over its upper surface at such a time that the top plate starts its downward motion at about peak initial current. Generators of this class were first developed by Chernyshev, Protasov, and Shevtsov who called them "disk" generators, the name we have adopted here. Design details of the generator are given in Sec. II. They are based in considerable part on two-dimensional hydrodynamic calculations. Shot results are summarized in Sec. III, together with a discussion of the data obtained. 3 refs., 7 figs.

37011 (LA-UR–89-2163) **A simultaneous helical generator.** Rickel, D.G.; Freeman, B.L.; Fowler, C.M.; Vorthman, J.E.; Marsh, S.P. Los Alamos National Lab., NM (USA). 1989. 8p. Sponsored by

Department of Defense. DOE Contract W-7405-ENG-36. (CONF-890710–4: 5. international conference on megagauss magnetic field generation and related topics, Novosibirsk, USSR, 3-7 Jul 1989). Order Number DE89014284/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A need is emerging for a class of short-pulse, high-voltage, magnetic flux compression generators (FCGs). It is desirable that these generators be compact, inexpensive and have modest prime power requirements. Toward this end several concepts have been worked on in our Laboratory, one of which is the conical helical generator described in this paper. 5 figs.

37012 (LA-UR–89-2169) **Plasma flow switch characterization for the Los Alamos Foil Implosion Project.** Bowers, R.L.; Brownell, J.H.; Greene, A.E.; Peterson, D.L. Los Alamos National Lab., NM (USA). 1989. 12p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890710–2: 5. international conference on megagauss magnetic field generation and related topics, Novosibirsk, USSR, 3-7 Jul 1989). Order Number DE89014279/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The next system design under consideration for the Los Alamos Foil Implosion Project is projected to deliver tens of mega-amperes of electrical current produced by high-explosive driven flux compression generators on a time scale of about one microsecond to a load foil. The use of such generators, with time scales of order several tenths of a millisecond, leads to considerable pulse shaping problems. Previously it was noted that a commutating switch might serve as an efficient alternative to a closing switch in transferring current from a coaxial transmission line to a cylindrically imploding load. Research at the Air Force Weapons Laboratory (AFWL) has met with considerable success in efficiently transferring currents of order 10 MA to an imploding liner using the plasma flow switch concept (PFS). Besides efficiently transferring current, the plasma flow switch protects the load region from high voltages generated by an opening switch until the current is present to provide magnetic insulation. For these reasons, a PFS is being investigated as the final pulse shaping step in the design. A series of capacitor bank experiments is also being fielded to help investigate physics issues and to benchmark the codes. 4 refs., 7 figs.

37013 (LA-UR–89-2194) **High-performance, high-current fuses for flux compression generator driven inductive store power conditioning applications.** Reinovsky, R.E.; Lindemuth, I.R.; Goforth, J.H.; Caird, R.S.; Fowler, C.M. Los Alamos National Lab., NM (USA). 1989. 21p. Sponsored by Department of Defense. DOE Contract W-7405-ENG-36. (CONF-890710–7: 5. international conference on megagauss magnetic field generation and related topics, Novosibirsk, USSR, 3-7 Jul 1989). Order Number DE89014274/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Large-scale helical flux compression generators deliver energies in the range of 10–50 MJ in economical, flexible packages for powering a variety of plasma and electron beam experiments. While conventional, end-detonating, helical generators are simple and reliable, they have the disadvantage of delivering their energy over long timescales, up to 400–500 μs, and at relatively low output voltages. Many experiments require faster risetimes than can be delivered by a helical FCG directly, and inductive systems utilizing high current interrupting switches can be employed to match generator performance to load requirements. For this experiment, a 15-MJ class helical flux compression generator was selected as the primary energy source. This flux compressor is a modification of a design proposed by Pavlovski in 1979 and used routinely in Los Alamos programs. The generator consists of a multiple conductor, multiple pitch, helical stator and a hollow copper armature containing a 60-kg charge of PBX 9501 high explosive (HE) which is initiated by a small plane wave lens at the end opposite the output. 8 refs., 12 figs.

37014 (ORNL/TM–10979) **A symbolic generator of state equations for modeling of dynamic systems based on the electrical network analog paradigm.** Depiante, E.V. Oak Ridge National Lab., TN (USA). Mar 1989. 39p. Sponsored by DOE Nuclear Energy. DOE Contract AC05-84OR21400. Order Number DE89013763/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The capability of automatically generating state equations for a given system is a desirable component of an integrated environment for system control and simulation studies. A step towards the development of this capability is described in the following sections. Section 2 presents the statement of the problem to be solved. Since the solution approach involves the use of circuit analogs topology concepts are required; these are presented in Section 3. The governing network equations and different network formulations are given in Section 4. The problem of systematically formulating the state equations is the topic of Section 5. A program (SEQS) developed to automatically generate the state equations is described in Section 6 and its application is illustrated in Section 7. Section 8 contains the conclusions. Appendix A gives a listing of the SEQS program and Appendix B gives a sample input file for the SEQS program. 6 refs., 4 figs., 2 tabs.

37015 (SAND–89-0037) **LineCAP [Line/Circuit Analysis Program]: Cross-coupling on PC [printed circuit] board traces including discontinuities and circuit elements.** Bacon, L.D.; Toth, R.P. Sandia National Labs., Albuquerque, NM (USA). Jun 1989. 42p. Sponsored by DOE Energy Research. DOE Contract AC04-76DP00789. Order Number DE89013884/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A program has been written that allows us to predict the trace-to-trace cross-coupling on printed circuit boards for many geometries of practical interest. It combines multiconductor transmission line analysis with circuit analysis in the time domain. Multiple sections of uniform lines, of varying number and characteristics, can be interconnected by passive circuit elements. These circuit elements may represent physical components or the effects of discontinuities in the lines. These predictions were compared with measurements for simple geometries, with good agreement in both waveshape and amplitude. The major discrepancies were in the amplitudes of fast rising spikes and are probably due to the fact that the predictions did not account for the increasing attenuation at high frequencies. 10 refs., 12 figs.

37016 (SAND–89-0068C) **Numerical analysis of experimental data to infer plasma opening switches.** Moore, W.B.; McDaniel, D.H.; Mowrer, G.R.; Rochau, G.E. Sandia National Labs., Albuquerque, NM (USA). 1989. 5p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-890665–22: 7. Institute of Electrical and Electronics Engineers pulsed power conference, Monterey, California, USA, 12-14 Jun 1989). Order Number DE89014489/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Plasma Opening Switch (POS) experiments to support Sandia National Laboratories PBFA II ion beam accelerator were conducted on Maxwell Laboratories Blackjack 5 accelerator. The first experiment tested an improved flashboard plasma source to generate a uniformly opening POS. The results showed that the J x B force caused plasma motion into the diode load region prior to the opening of the POS. Plasma motion was inferred by comparing experimental data to circuit models which used a variable resistance POS and a variable inductance (L-dot) term. The L-dot term was necessary in the model to reproduce the experimental results. 4 refs., 13 figs.

37017 (SAND–89-0292C) **Photocurrent variability of discrete bipolar devices.** Huffman, D.D.; Wrobel, T.F.; Hospelhorn, R.L.; Willis, D. Sandia National Labs., Albuquerque, NM (USA). 1989. 5p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-890723–8: 26. annual conference on nuclear and space radiation effects, Marco Island, Florida, USA, 24-28 Jul 1989). Order Number DE89008227/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Thirty-nine (39) bipolar device lots (195 devices) were tested for peak photocurrent. Difference in average photocurrent between lots of same device types was less than a factor of three in all cases. 4 figs.

37018 (SAND–89-1569C) **Standard terminal panel and UPS [uninterruptible power supply] design for exterior intrusion detectors and data collection applications.** Wolfenbarger, F.M. Sandia National Labs., Albuquerque, NM (USA). 1989. 11p.

Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-890736–16: 30. annual meeting of the Institute of Nuclear Materials Management, Orlando, Florida, USA, 9-12 Jul 1989). Order Number DE89014487/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Need for standardization has been discussed for years by many government agencies. In the past, every perimeter site upgrade resulted in the design, specification, procurement, and fabrication of a unique power and signal junction box. To save design and specification cost, a standard terminal panel and uninterruptible power supply (UPS) design for an exterior intrusion sensor detection system was developed for a security system within the Sandia National Laboratories complex at Albuquerque, New Mexico. In facilitating this requirement a design was sought that could easily be modified for other government or commercial applications and one that could easily be fabricated in the shop. Also of primary importance was the need for lightning protection for both the communications and voltage sources. A 12V dc UPS with a current capacity of up to 4 amperes complements the standard terminal design and allows uninterrupted sensor operation for a number of hours should the primary ac source be interrupted. This report encompasses the features of the designs. The designs are also being used and continuously evaluated in Sandia's Area III exterior test field. 7 figs.

37019 (UCRL–100361) **Vacuum insulator failure measurements and improvement.** Vogtlin, G.E.; Vernazza, J.E. Lawrence Livermore National Lab., CA (USA). Jun 1989. 4p. Sponsored by DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-890665–34: 7. Institute of Electrical and Electronics Engineers pulsed power conference, Monterey, CA, USA, 12-14 Jun 1989). Order Number DE89014269/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Cones, cylinders, and insulators have been tested with a 3 nanosecond full width halfmax pulse. These insulators were made of epoxy, acrylic, lexan, and nylon. The tests were conducted with cone insulators at +45 degrees, –45 degrees, and 0 degree. Additionally, tests were conducted with a plug in the anode that reduces the anode stress, and anodized cathodes. Best results were obtained with both an anodized cathode and an anode plug where failure was through the solid dielectric at 600 kV/cm. Results of this testing will be presented. Explosive emission was also evaluated with the same apparatus. All tests were conducted without conditioning. Currents could be detected down to 10 milliamps. Data for brass, copper, stainless, aluminium will be presented. The onset of explosive emission could be detected. The lowest onset was for brass at less than 200 kV/cm. The best was a carbon loaded epoxy emission. Currents have been detected that follow a Fowler-Nordheim like function of voltage. 6 refs., 3 figs.

37020 Real-time optical processor for synthetic aperture radar image formation. Stalker, K.T. (Sandia National Labs., Albuquerque, NM (US)); Molley, P.A.; Dickey, F.M. v.v of Optical technology for microwave applications III. Yao, S.K. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (1987). (CONF-8705248–: 3. optical technology for microwave applications meeting, Orlando, FL, USA, 19-20 May 1987).

An acousto-optic processor which forms synthetic aperture radar images in real-time is described. It employs a space and time integrating architecture to perform the required two dimensional matched filtering operation as a sequence of one dimensional processes. The matched filtering in range is performed on each radar return pulse using the acousto-optic device. The azimuthal matched filtering is performed using a fixed reference mask and a charge-coupled device operating in the time delay and integrate mode. This fixed mask architecture has been modified to include a background subtraction capability to reduce the effects of unwanted bias terms on image quality. The effectiveness of this technique is analyzed for two different time bandwidth product cases. SAR imagery formed using the real-time optical processor is presented.

37021 Transition metal oxide electrochemical capacitors. Raistrick, I.D. (Los Alamos National Lab., Los Alamos, NM (US)); Beery, J.G.; Sherman, R.J. v.v of Electro-ceramics and solid-state ionics. Tuller, H.L.; Smyth, D.M. The Electrochemical Society, Pennington, NJ (1987). (CONF-8710306–: Symposium on electro ceramics and solid state ionics, Honolulu, HI, USA, 18-23 Oct 1987).

The electrical response of electrochemical capacitors based upon ruthenium dioxide is discussed and compared with that of similar devices based upon high surface carbon. Equivalent electrical circuits are proposed that approximate the response of the two types of device. The effects of fabrication and electrolyte variables on the small-signal ac impedance are described.

37022 (CANMET–8712) **Tube wastage in FBC boilers at Summerside - causes and resolution.** Razbin, V.V.; Friedrich, F.D. Canada Centre for Mineral and Energy Technology, Ottawa, ON (Canada). 1987. 43p. (MICROLOG–88-06056). Available from Canada Centre for Mineral and Energy Technology, Technical Information Division, 555 Booth St., Rm. 342, Ottawa, ON, Canada K1A 0G1; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Canada's first application of fluidized bed technology to the combustion of coal was a heating plant, completed late in 1982, at Canadian Forces Base Summerside, Prince Edward Island. The plant consists of two bubbling bed boilers, rated at 18,000 kg/h of medium pressure steam, and fired with high sulphur content coal. Although startup problems were numerous, by the end of the first two heating seasons the boilers had met all guarantees concerning capacity, efficiency, and emissions. However, wastage of the heat exchange surfaces exposed to the bed had become evident by the second month of operation. Several corrective measures were implemented with varying degrees of success. Ultimately, two configurations of protective hardware were found to be effective: closely-spaced pin studs on the waterwalls, and longitudinal rods, five per tube, on the inbed tubes. This paper provides chronological data on the metal wastage in the Summerside boilers. The effects of air jets, large particles, location of inbed tube bundles, and several forms of protective hardware are discussed. Also described is a current experiment with the inbed tube bundle. Since the fall of 1985, the boilers have been operating successfully with no significant tube wastage. 3 refs., 20 figs., 5 tabs.

37023 (SAND–89-1385C) **A recuperative gas fired forge furnace.** Gunter, R.; Schuler, K.W.; Ward, R.L. Sandia National Labs., Albuquerque, NM (USA). 1989. 10p. Sponsored by DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-8906143–1: Western states forging conference, Carbondale, CO, USA, 5-7 Jun 1989). Order Number DE89013448/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

To overcome the heat deficit and oxidizing atmosphere problems and to reduce fuel consumption, a small gas forge furnace has been developed which incorporates recuperative heating; as the combustion air is drawn into the furnace it is preheated by passing it through a simple heat exchanger which is heated by the exhaust gases from the furnace. This recuperative heating principle is the same used by blast and open hearth furnaces but they typically employ complex heat exchangers, and extensive blowers and valving to direct the flow of the intake and exhaust gases. In the furnace described in this article a chimney is provided at the rear of the furnace and the air intake ducts pass through the chimney before reaching the venturi where the fuel gas is injected. Thermocouples were place in the air intake ducts and the temperature of the recuperated air was 1000 F. Based on data in the Mechanical Engineers Handbook (Industrial Heating Furnaces) fuel savings are directly related to the temperature of the preheated air. The theoretical saving in fuel with 800 F. combustion air is about 19%. The furnace is very quiet, since no blowers are used and the venturi is located in the center of a long tube. To control the furnace atmosphere and to help reduce heat loss, a close fitting swing away door has been incorporated, and the entire furnace is insulated with lightweight high performance ceramic insulation. The resulting furnace easily achieves forge welding temperatures, has an oxygen

depleted atmosphere and has proven to be very effective and capable for small machine and hand forging operations. 6 figs.

37024 (SC–8706) **The influence of termination configuration on the flow performance of flues.** Haysam, J.C.; Swinton, M.C.; Wilson, A.G.; White, J.H. Wind tunnel tests were conducted on a number of common configurations of furnace and fireplace flue terminations to determine the horizontal and vertical wind pressure coefficients for each configuration for a range of wind attack angles and to determine the restriction to flue flow created by each configuration. The results indicate the following: for any given set of wind conditions, there are wide variations in the performance of various chimney caps, in terms of their likely effect on the combustion venting performance of the chimney; and, in deciding to use a cap on a particular chimney and in choosing a particular cap to use, the wind conditions likely to prevail at the top of the chimney and the performance characteristics of the candidate caps should be taken into account. To facilitate the informed selection of flue caps, it is suggested that Canadian standards related to flue caps be modified to incorporate detailed performance testing and rating of caps. The test data were organized in a manner that would facilitate its use in calculations and modelling such in the FLUE SIMULATOR computer program. 3 refs., 21 figs., 8 tabs.

37025 (SC–8708) **The influence of flue sharing on venting performance.** Haysom, J.C.; Swinton, M.C.; Wilson, A.G.; White, J.H. Scanda Consultants Ltd., Ottawa, ON (Canada). 1987. 94p.
